16 TXDEFPIS	MMC Transmit Deferred Packet Counter Interrupt Status This bit is set when the txdeferred counter reaches half of the maximum value or the maximum value. MMC Transmit Deferred Packet Counter Interrupt Status This bit is set when the txdeferred counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Deferred Packet Counter Interrupt Status not detected 1 - MMC Transmit Deferred Packet Counter Interrupt Status detected
15 TXMCOLGPIS	MMC Transmit Multiple Collision Good Packet Counter Interrupt Status This bit is set when the txmulticol_g counter reaches half of the maximum value or the maximum value. MMC Transmit Multiple Collision Good Packet Counter Interrupt Status This bit is set when the txmulticol_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Multiple Collision Good Packet Counter Interrupt Status not detected 1 - MMC Transmit Multiple Collision Good Packet Counter Interrupt Status detected
14 TXSCOLGPIS	MMC Transmit Single Collision Good Packet Counter Interrupt Status This bit is set when the txsinglecol_g counter reaches half of the maximum value or the maximum value. MMC Transmit Single Collision Good Packet Counter Interrupt Status This bit is set when the txsinglecol_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Single Collision Good Packet Counter Interrupt Status not detected 1 - MMC Transmit Single Collision Good Packet Counter Interrupt Status detected
13 TXUFLOWERPIS	MMC Transmit Underflow Error Packet Counter Interrupt Status This bit is set when the txunderflowerror counter reaches half of the maximum value or the maximum value. MMC Transmit Underflow Error Packet Counter Interrupt Status This bit is set when the txunderflowerror counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Underflow Error Packet Counter Interrupt Status not detected 1 - MMC Transmit Underflow Error Packet Counter Interrupt Status detected
12 TXBCGBPIS	MMC Transmit Broadcast Good Bad Packet Counter Interrupt Status This bit is set when the txbroadcastpackets_gb counter reaches half of the maximum value or the maximum value. MMC Transmit Broadcast Good Bad Packet Counter Interrupt Status This bit is set when the txbroadcastpackets_gb counter reaches half of the maximum value or the maximum value.

Table continues on the next page...

Field	Description
	Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Broadcast Good Bad Packet Counter Interrupt Status not detected 1 - MMC Transmit Broadcast Good Bad Packet Counter Interrupt Status detected
11 TXMCGBPIS	MMC Transmit Multicast Good Bad Packet Counter Interrupt Status The bit is set when the txmulticastpackets_gb counter reaches half of the maximum value or the maximum value. MMC Transmit Multicast Good Bad Packet Counter Interrupt Status The bit is set when the txmulticastpackets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Multicast Good Bad Packet Counter Interrupt Status not detected 1 - MMC Transmit Multicast Good Bad Packet Counter Interrupt Status detected
10 TXUCGBPIS	MMC Transmit Unicast Good Bad Packet Counter Interrupt Status This bit is set when the txunicastpackets_gb counter reaches half of the maximum value or the maximum value. MMC Transmit Unicast Good Bad Packet Counter Interrupt Status This bit is set when the txunicastpackets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Unicast Good Bad Packet Counter Interrupt Status not detected 1 - MMC Transmit Unicast Good Bad Packet Counter Interrupt Status detected
9 TX1024TMAXOCTGBPIS	MMC Transmit 1024 to Maximum Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx1024tomaxoctets_gb counter reaches half of the maximum value or the maximum value. MMC Transmit 1024 to Maximum Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx1024tomaxoctets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit 1024 to Maximum Octet Good Bad Packet Counter Interrupt Status not detected 1 - MMC Transmit 1024 to Maximum Octet Good Bad Packet Counter Interrupt Status detected
8 TX512T1023OCTGBPIS	MMC Transmit 512 to 1023 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx512to1023octets_gb counter reaches half of the maximum value or the maximum value. MMC Transmit 512 to 1023 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx512to1023octets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit 512 to 1023 Octet Good Bad Packet Counter Interrupt Status not detected 1 - MMC Transmit 512 to 1023 Octet Good Bad Packet Counter Interrupt Status detected
7 TX256T511OCTGBPIS	MMC Transmit 256 to 511 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx256to511octets_gb counter reaches half of the maximum value or the maximum value. MMC Transmit 256 to 511 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx256to511octets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit 256 to 511 Octet Good Bad Packet Counter Interrupt Status not detected

Field	Description
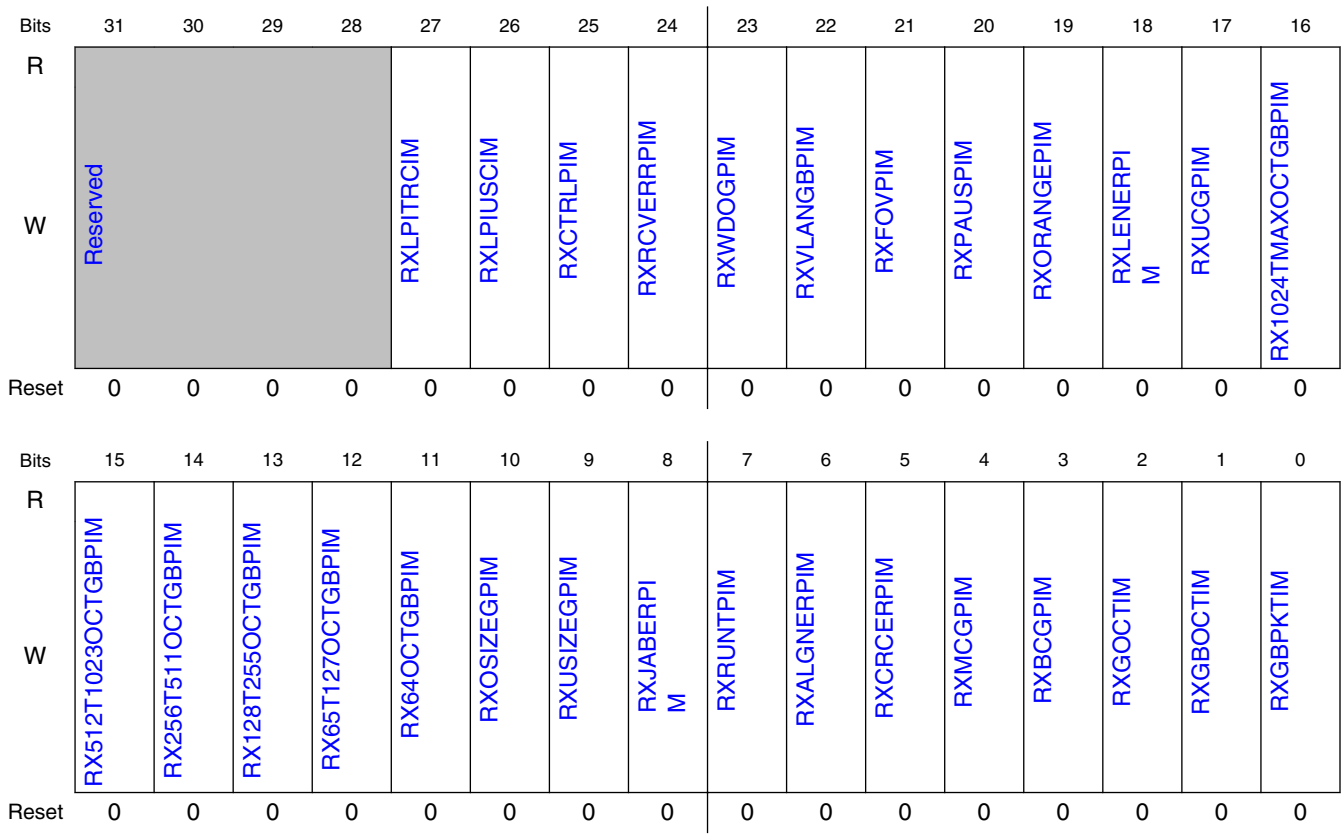
1 TXGBPKTIS	MMC Transmit Good Bad Packet Counter Interrupt Status This bit is set when the txpacketcount_gb counter reaches half of the maximum value or the maximum value. MMC Transmit Good Bad Packet Counter Interrupt Status This bit is set when the txpacketcount_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Good Bad Packet Counter Interrupt Status not detected 1 - MMC Transmit Good Bad Packet Counter Interrupt Status detected
0 TXGBOCTIS	MMC Transmit Good Bad Octet Counter Interrupt Status This bit is set when the txoctetcount_gb counter reaches half of the maximum value or the maximum value. MMC Transmit Good Bad Octet Counter Interrupt Status This bit is set when the txoctetcount_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Transmit Good Bad Octet Counter Interrupt Status not detected 1 - MMC Transmit Good Bad Octet Counter Interrupt Status detected

11.7.6.1.179 MMC Rx Interrupt Mask (MAC_MMC_RX_INTERRUPT_MASK)

This register maintains the masks for interrupts generated from all Receive statistics counters.

This register maintains the masks for interrupts generated from all Receive statistics counters.



The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values.

This register is 32 bit wide.

11.7.6.1.225.3 Fields

Field	Description
31-0 RXLENERR	Rx Length Error Packets This field indicates the number of packets received with length error (Length Type field not equal to packet size), for all packets with valid length field.

11.7.6.1.226 Out-of-range Type Packets Received (MAC_RX_OUT_OF_RANGE_TYPE_PACKETS)

This register provides the number of packets received by DWC_ether_qos with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

11.7.6.1.226.1 Offset

Register	Offset

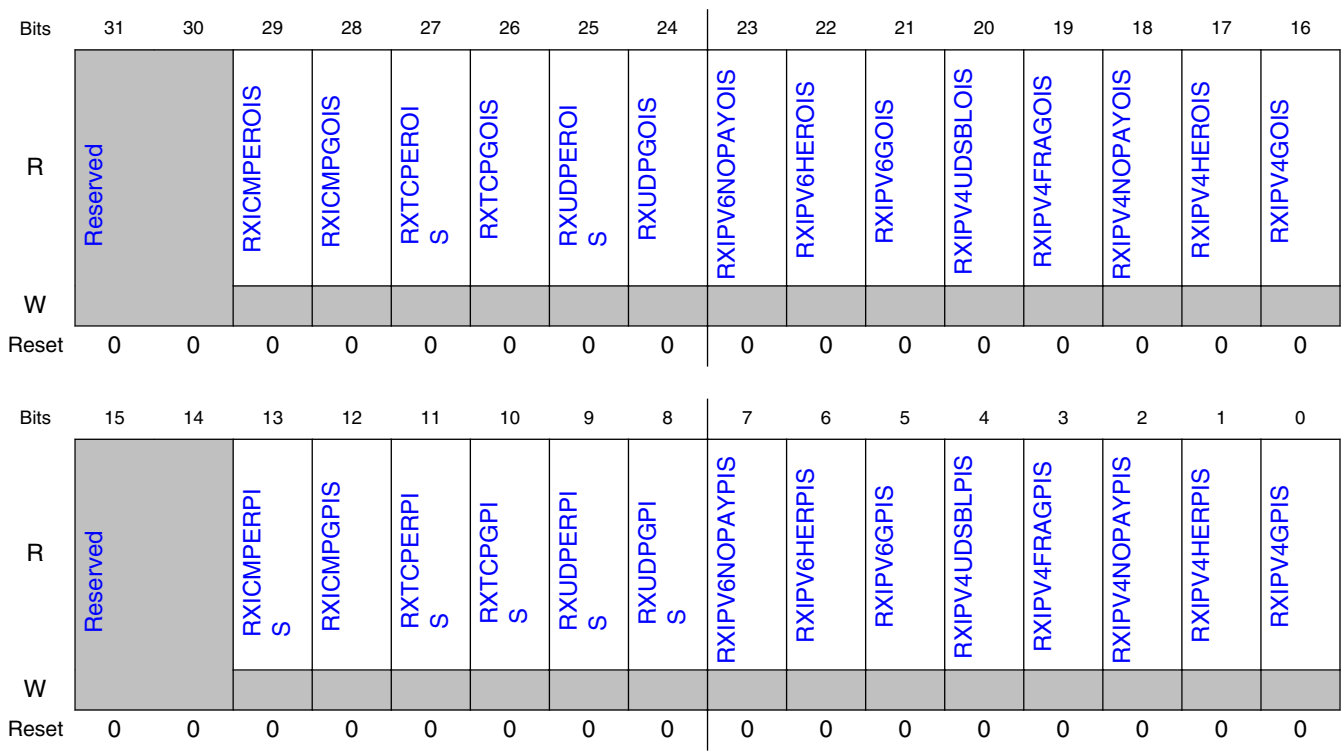
11.7.6.1.238 MMC IPC Receive Interrupt (MAC_MMC_IPC_RX_INTERRUPT)

This register maintains the interrupt that the receive IPC statistic counters generate.



The MMC Receive Checksum Offload Interrupt register maintains the interrupts generated when receive IPC statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones.

The MMC Receive Checksum Offload Interrupt register is 32 bit wide. When the MMC IPC counter that caused the interrupt is read, its corresponding interrupt bit is cleared. The counter's least-significant byte lane (Bits[7:0]) must be read to clear the interrupt bit.

MMC Receive TCP Good Octet Counter Interrupt Status This bit is set when the rxtcp_gd_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive TCP Good Octet Counter Interrupt Status not detected 1 - MMC Receive TCP Good Octet Counter Interrupt Status detected
25 RXUDPEROIS	MMC Receive UDP Error Octet Counter Interrupt Status This bit is set when the rxudp_err_octets counter reaches half of the maximum value or the maximum value. MMC Receive UDP Error Octet Counter Interrupt Status This bit is set when the rxudp_err_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive UDP Error Octet Counter Interrupt Status not detected 1 - MMC Receive UDP Error Octet Counter Interrupt Status detected
24 RXUDPGOIS	MMC Receive UDP Good Octet Counter Interrupt Status This bit is set when the rxudp_gd_octets counter reaches half of the maximum value or the maximum value. MMC Receive UDP Good Octet Counter Interrupt Status This bit is set when the rxudp_gd_octets counter reaches half of the maximum value or the maximum value.

Table continues on the next page...

Field	Description
	Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive UDP Good Octet Counter Interrupt Status not detected 1 - MMC Receive UDP Good Octet Counter Interrupt Status detected
23 RXIPV6NOPAYOIS	MMC Receive IPV6 No Payload Octet Counter Interrupt Status This bit is set when the rxipv6_nopay_octets counter reaches half of the maximum value or the maximum value. MMC Receive IPV6 No Payload Octet Counter Interrupt Status This bit is set when the rxipv6_nopay_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive IPV6 No Payload Octet Counter Interrupt Status not detected 1 - MMC Receive IPV6 No Payload Octet Counter Interrupt Status detected
22 RXIPV6HEROIS	MMC Receive IPV6 Header Error Octet Counter Interrupt Status This bit is set when the rxipv6_hdrerr_octets counter reaches half of the maximum value or the maximum value. MMC Receive IPV6 Header Error Octet Counter Interrupt Status This bit is set when the rxipv6_hdrerr_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive IPV6 Header Error Octet Counter Interrupt Status not detected 1 - MMC Receive IPV6 Header Error Octet Counter Interrupt Status detected
21 RXIPV6GOIS	MMC Receive IPV6 Good Octet Counter Interrupt Status This bit is set when the rxipv6_gd_octets counter reaches half of the maximum value or the maximum value. MMC Receive IPV6 Good Octet Counter Interrupt Status This bit is set when the rxipv6_gd_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive IPV6 Good Octet Counter Interrupt Status not detected 1 - MMC Receive IPV6 Good Octet Counter Interrupt Status detected
20 RXIPV4UDSBLOIS	MMC Receive IPV4 UDP Checksum Disabled Octet Counter Interrupt Status This bit is set when the rxipv4_udsbl_octets counter reaches half of the maximum value or the maximum value. MMC Receive IPV4 UDP Checksum Disabled Octet Counter Interrupt Status This bit is set when the rxipv4_udsbl_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive IPV4 UDP Checksum Disabled Octet Counter Interrupt Status not detected 1 - MMC Receive IPV4 UDP Checksum Disabled Octet Counter Interrupt Status detected
19 RXIPV4FRAGOIS	MMC Receive IPV4 Fragmented Octet Counter Interrupt Status This bit is set when the rxipv4_frag_octets counter reaches half of the maximum value or the maximum value. MMC Receive IPV4 Fragmented Octet Counter Interrupt Status This bit is set when the rxipv4_frag_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.

Table continues on the next page...

Field	Description
	0 - MMC Receive IPV4 Fragmented Octet Counter Interrupt Status not detected 1 - MMC Receive IPV4 Fragmented Octet Counter Interrupt Status detected
18 RXIPV4NOPAYOIS	MMC Receive IPV4 No Payload Octet Counter Interrupt Status This bit is set when the rxipv4_nopay_octets counter reaches half of the maximum value or the maximum value. MMC Receive IPV4 No Payload Octet Counter Interrupt Status This bit is set when the rxipv4_nopay_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive IPV4 No Payload Octet Counter Interrupt Status not detected 1 - MMC Receive IPV4 No Payload Octet Counter Interrupt Status detected
17 RXIPV4HEROIS	MMC Receive IPV4 Header Error Octet Counter Interrupt Status This bit is set when the rxipv4_hdrerr_octets counter reaches half of the maximum value or the maximum value. MMC Receive IPV4 Header Error Octet Counter Interrupt Status This bit is set when the rxipv4_hdrerr_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive IPV4 Header Error Octet Counter Interrupt Status not detected 1 - MMC Receive IPV4 Header Error Octet Counter Interrupt Status detected
16 RXIPV4GOIS	MMC Receive IPV4 Good Octet Counter Interrupt Status This bit is set when the rxipv4_gd_octets counter reaches half of the maximum value or the maximum value. MMC Receive IPV4 Good Octet Counter Interrupt Status This bit is set when the rxipv4_gd_octets counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive IPV4 Good Octet Counter Interrupt Status not detected 1 - MMC Receive IPV4 Good Octet Counter Interrupt Status detected
15-14 —	Reserved
13 RXICMPERPIS	MMC Receive ICMP Error Packet Counter Interrupt Status This bit is set when the rxicmp_err_pkts counter reaches half of the maximum value or the maximum value. MMC Receive ICMP Error Packet Counter Interrupt Status This bit is set when the rxicmp_err_pkts counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive ICMP Error Packet Counter Interrupt Status not detected 1 - MMC Receive ICMP Error Packet Counter Interrupt Status detected
12 RXICMPGPIS	MMC Receive ICMP Good Packet Counter Interrupt Status This bit is set when the rxicmp_gd_pkts counter reaches half of the maximum value or the maximum value. MMC Receive ICMP Good Packet Counter Interrupt Status This bit is set when the rxicmp_gd_pkts counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.

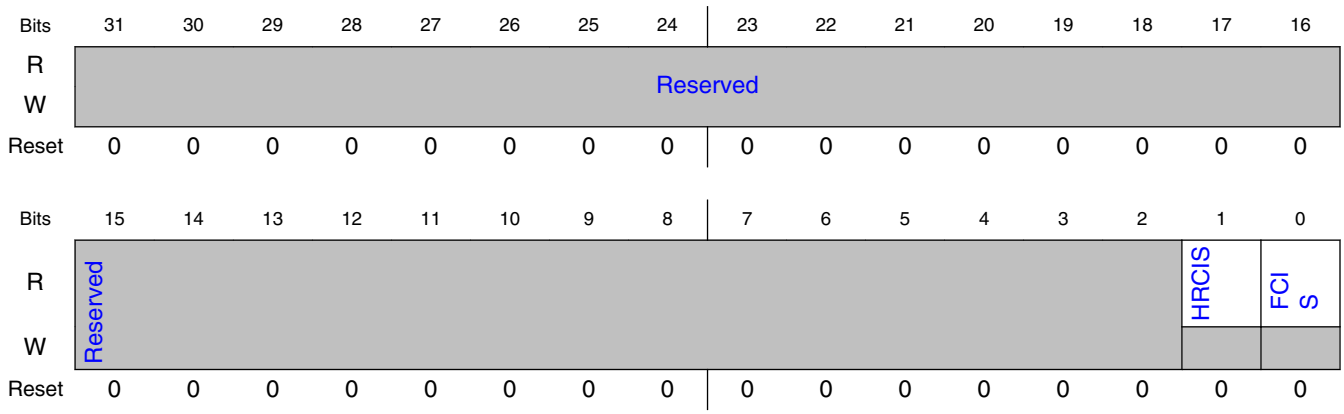
11.7.6.1.267 MMC FPE Transmit Interrupt (MAC_MMC_FPE_TX_INTERRUPT)



This register maintains the interrupts generated from all FPE related Transmit statistics counters.

This register maintains the interrupts generated from all FPE related Transmit statistics counters. The MMC FPE Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

11.7.6.1.273.3 Fields

Field	Description
31-0	Rx Packet Assembly Error Counter This field indicates the number of MAC frames with reassembly errors on the Receiver, due to mismatch in the Fragment Count value.

Field	Description
PAEC	Rx Packet Assembly Error Counter This field indicates the number of MAC frames with reassembly errors on the Receiver, due to mismatch in the Fragment Count value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

11.7.6.1.274 MMC Receive Packet SMD Error Counter (MAC_MMC_RX_PACKET_SMD_ERR_CNTR)

This register provides the number of received MAC frames rejected due to unknown SMD value and MAC frame fragments rejected due to arriving with an SMD-C when there was no preceding preempted frame.

11.7.6.1.274.1 Offset

Register	Offset
MAC_MMC_RX_PACKET_SMD_ERR_CNTR	8CCh

31-29 —	Reserved
28 DMCHEN0	DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter. 0 - DMA Channel Select is disabled 1 - DMA Channel Select is enabled
27 —	Reserved
26-24 DMCHN0	DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. DMA Channel Number

Table continues on the next page...

Field	Description
	When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23-22 —	Reserved
21 L4DPIM0	Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4DPM0 bit is set high. 0 - Layer 4 Destination Port Inverse Match is disabled 1 - Layer 4 Destination Port Inverse Match is enabled
20 L4DPM0	Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching. 0 - Layer 4 Destination Port Match is disabled 1 - Layer 4 Destination Port Match is enabled
19 L4SPIM0	Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high. 0 - Layer 4 Source Port Inverse Match is disabled 1 - Layer 4 Source Port Inverse Match is enabled
18 L4SPM0	Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching. 0 - Layer 4 Source Port Match is disabled 1 - Layer 4 Source Port Match is enabled
17 —	Reserved
16 L4PEN0	Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

Table continues on the next page...

Field	Description
	The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set. 0 - Layer 4 Protocol is disabled 1 - Layer 4 Protocol is enabled
15-11 L3HDBM0	Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10-6 L3HSBM0	Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM0	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. Layer 3 IP DA Inverse Match Enable

Table continues on the next page...

Field	Description
	When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0 - Layer 3 IP DA Inverse Match is disabled 1 - Layer 3 IP DA Inverse Match is enabled
4 L3DAM0	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0 - Layer 3 IP DA Match is disabled 1 - Layer 3 IP DA Match is enabled
3 L3SAIM0	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0 - Layer 3 IP SA Inverse Match is disabled 1 - Layer 3 IP SA Inverse Match is enabled
2 L3SAM0	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0 - Layer 3 IP SA Match is disabled 1 - Layer 3 IP SA Match is enabled
1 —	Reserved
0 L3PEN0	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

11.7.6.1.278 Layer 4 Address 0 (MAC_LAYER4_ADDRESS0)

The MAC_LAYER4_ADDRESS(#i), MAC_L3_L4_CONTROL(#i), MAC_LAYER3_ADDR0_Reg(#i), MAC_LAYER3_ADDR1_Reg(#i), MAC_LAYER3_ADDR2_Reg(#i) and MAC_LAYER3_ADDR3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Field	Description
	- 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10-6 L3HSBM1	Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM1	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0 - Layer 3 IP DA Inverse Match is disabled 1 - Layer 3 IP DA Inverse Match is enabled
4 L3DAM1	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. Layer 3 IP DA Match Enable

Table continues on the next page...

Field	Description
	When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0 - Layer 3 IP DA Match is disabled 1 - Layer 3 IP DA Match is enabled
3 L3SAIM1	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0 - Layer 3 IP SA Inverse Match is disabled 1 - Layer 3 IP SA Inverse Match is enabled
2 L3SAM1	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0 - Layer 3 IP SA Match is disabled 1 - Layer 3 IP SA Match is enabled
1 —	Reserved
0 L3PEN1	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

11.7.6.1.284 Layer 4 Address 0 (MAC_LAYER4_ADDRESS1)

The MAC_LAYER4_ADDRESS(#i), MAC_L3_L4_CONTROL(#i), MAC_LAYER3_ADDR0_Reg(#i), MAC_LAYER3_ADDR1_Reg(#i), MAC_LAYER3_ADDR2_Reg(#i) and MAC_LAYER3_ADDR3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Field	Description
31-16 L4DP2	Layer 4 Destination Port Number Field When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. Layer 4 Destination Port Number Field When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4DPM0 bits are set in MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.
15-0 L4SP2	Layer 4 Source Port Number Field When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. Layer 4 Source Port Number Field When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4SPM0 bits are set in MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

11.7.6.1.291 Layer 3 Address 0 Register 2 (MAC_LAYER3_ADDR0_REG2)

For IPv4 packets, the Layer 3 Address 0 Register 2 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

11.7.6.1.295.3 Fields

Field	Description
31-29 —	Reserved
28 DMCHEN3	DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter. 0 - DMA Channel Select is disabled 1 - DMA Channel Select is enabled
27 —	Reserved
26-24 DMCHN3	DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. DMA Channel Number

Table continues on the next page...

Field	Description
	When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23-22 —	Reserved
21 L4DPIM3	Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4DPM0 bit is set high. 0 - Layer 4 Destination Port Inverse Match is disabled 1 - Layer 4 Destination Port Inverse Match is enabled
20 L4DPM3	Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching. 0 - Layer 4 Destination Port Match is disabled 1 - Layer 4 Destination Port Match is enabled
19 L4SPIM3	Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high. 0 - Layer 4 Source Port Inverse Match is disabled 1 - Layer 4 Source Port Inverse Match is enabled
18 L4SPM3	Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching. 0 - Layer 4 Source Port Match is disabled 1 - Layer 4 Source Port Match is enabled
17 —	Reserved
16 L4PEN3	Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

Table continues on the next page...

Field	Description
	The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set. 0 - Layer 4 Protocol is disabled 1 - Layer 4 Protocol is enabled
15-11 L3HDBM3	Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10-6 L3HSBM3	Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM3	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. Layer 3 IP DA Inverse Match Enable

Table continues on the next page...

Field	Description
	When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0 - Layer 3 IP DA Inverse Match is disabled 1 - Layer 3 IP DA Inverse Match is enabled
4 L3DAM3	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0 - Layer 3 IP DA Match is disabled 1 - Layer 3 IP DA Match is enabled
3 L3SAIM3	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0 - Layer 3 IP SA Inverse Match is disabled 1 - Layer 3 IP SA Inverse Match is enabled
2 L3SAM3	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0 - Layer 3 IP SA Match is disabled 1 - Layer 3 IP SA Match is enabled
1 —	Reserved
0 L3PEN3	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

11.7.6.1.296 Layer 4 Address 3 (MAC_LAYER4_ADDRESS3)

The MAC_LAYER4_ADDRESS(#i), MAC_L3_L4_CONTROL(#i), MAC_LAYER3_ADDR0_Reg(#i), MAC_LAYER3_ADDR1_Reg(#i), MAC_LAYER3_ADDR2_Reg(#i) and MAC_LAYER3_ADDR3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

11.7.6.1.301.3 Fields

Field	Description
31-29 —	Reserved
28 DMCHEN4	DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter. 0 - DMA Channel Select is disabled 1 - DMA Channel Select is enabled
27 —	Reserved
26-24 DMCHN4	DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23-22 —	Reserved
21 L4DPIM4	Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

Table continues on the next page...

Field	Description
	This bit is valid and applicable only when the L4DPM0 bit is set high. 0 - Layer 4 Destination Port Inverse Match is disabled 1 - Layer 4 Destination Port Inverse Match is enabled
20 L4DPM4	Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching. 0 - Layer 4 Destination Port Match is disabled 1 - Layer 4 Destination Port Match is enabled
19 L4SPIM4	Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high. 0 - Layer 4 Source Port Inverse Match is disabled 1 - Layer 4 Source Port Inverse Match is enabled
18 L4SPM4	Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching. 0 - Layer 4 Source Port Match is disabled 1 - Layer 4 Source Port Match is enabled
17 —	Reserved
16 L4PEN4	Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching. The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set. 0 - Layer 4 Protocol is disabled 1 - Layer 4 Protocol is enabled
15-11 L3HDBM4	Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field:

Table continues on the next page...

Field	Description
	- 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10-6 L3HSBM4	Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM4	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0 - Layer 3 IP DA Inverse Match is disabled 1 - Layer 3 IP DA Inverse Match is enabled
4 L3DAM4	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. Layer 3 IP DA Match Enable

Table continues on the next page...

Field	Description
	When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0 - Layer 3 IP DA Match is disabled 1 - Layer 3 IP DA Match is enabled
3 L3SAIM4	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0 - Layer 3 IP SA Inverse Match is disabled 1 - Layer 3 IP SA Inverse Match is enabled
2 L3SAM4	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0 - Layer 3 IP SA Match is disabled 1 - Layer 3 IP SA Match is enabled
1 —	Reserved
0 L3PEN4	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

11.7.6.1.302 Layer 4 Address 4 (MAC_LAYER4_ADDRESS4)

The MAC_LAYER4_ADDRESS(#i), MAC_L3_L4_CONTROL(#i), MAC_LAYER3_ADDR0_Reg(#i), MAC_LAYER3_ADDR1_Reg(#i), MAC_LAYER3_ADDR2_Reg(#i) and MAC_LAYER3_ADDR3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

11.7.6.1.302.1 Offset

11.7.6.1.302.3 Fields

Field	Description
31-16 L4DP4	Layer 4 Destination Port Number Field When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. Layer 4 Destination Port Number Field

Table continues on the next page...

Field	Description
	When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4DPM0 bits are set in MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.
15-0 L4SP4	Layer 4 Source Port Number Field When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. Layer 4 Source Port Number Field When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4SPM0 bits are set in MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

11.7.6.1.303 Layer 3 Address 0 Register 4 (MAC_LAYER3_ADDR0_REG4)

For IPv4 packets, the Layer 3 Address 0 Register 4 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

11.7.6.1.303.1 Offset

Register	Offset

11.7.6.1.303.3 Fields

Field	Description
31-0 L3A04	Layer 3 Address 0 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets. Layer 3 Address 0 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset and the L3SAM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

11.7.6.1.304 Layer 3 Address 1 Register 4 (MAC_LAYER3_ADDR1_REG4)

For IPv4 packets, the Layer 3 Address 1 Register 4 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

11.7.6.1.304.3 Fields

Field	Description
31-0 L3A14	Layer 3 Address 1 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets. Layer 3 Address 1 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset and the L3SAM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

11.7.6.1.305 Layer 3 Address 2 Register 4 (MAC_LAYER3_ADDR2_REG4)

The Layer 3 Address 2 Register 4 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.

Table continues on the next page...

Field	Description
10-6 L3HSBM5	Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM5	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0 - Layer 3 IP DA Inverse Match is disabled 1 - Layer 3 IP DA Inverse Match is enabled
4 L3DAM5	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0 - Layer 3 IP DA Match is disabled 1 - Layer 3 IP DA Match is enabled
3 L3SAIM5	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0 - Layer 3 IP SA Inverse Match is disabled 1 - Layer 3 IP SA Inverse Match is enabled
2 L3SAM5	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. Layer 3 IP SA Match Enable

Table continues on the next page...

Field	Description
	When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0 - Layer 3 IP SA Match is disabled 1 - Layer 3 IP SA Match is enabled
1 —	Reserved
0 L3PEN5	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

11.7.6.1.308 Layer 4 Address 5 (MAC_LAYER4_ADDRESS5)

The MAC_LAYER4_ADDRESS(#i), MAC_L3_L4_CONTROL(#i), MAC_LAYER3_ADDR0_Reg(#i), MAC_LAYER3_ADDR1_Reg(#i), MAC_LAYER3_ADDR2_Reg(#i) and MAC_LAYER3_ADDR3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

11.7.6.1.308.3 Fields

Field	Description
31-16 L4DP5	Layer 4 Destination Port Number Field When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. Layer 4 Destination Port Number Field When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4DPM0 bits are set in MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.
15-0 L4SP5	Layer 4 Source Port Number Field When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. Layer 4 Source Port Number Field When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4SPM0 bits are set in MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

11.7.6.1.309 Layer 3 Address 0 Register 5 (MAC_LAYER3_ADDR0_REG5)

For IPv4 packets, the Layer 3 Address 0 Register 5 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

31-29 —	Reserved
28 DMCHEN6	DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter. 0 - DMA Channel Select is disabled 1 - DMA Channel Select is enabled
27 —	Reserved
26-24 DMCHN6	DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. DMA Channel Number

Table continues on the next page...

Field	Description
	When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23-22 —	Reserved
21 L4DPIM6	Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4DPM0 bit is set high. 0 - Layer 4 Destination Port Inverse Match is disabled 1 - Layer 4 Destination Port Inverse Match is enabled
20 L4DPM6	Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching. 0 - Layer 4 Destination Port Match is disabled 1 - Layer 4 Destination Port Match is enabled
19 L4SPIM6	Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high. 0 - Layer 4 Source Port Inverse Match is disabled 1 - Layer 4 Source Port Inverse Match is enabled
18 L4SPM6	Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching. 0 - Layer 4 Source Port Match is disabled 1 - Layer 4 Source Port Match is enabled
17 —	Reserved
16 L4PEN6	Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

Table continues on the next page...

Field	Description
	The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set. 0 - Layer 4 Protocol is disabled 1 - Layer 4 Protocol is enabled
15-11 L3HDBM6	Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10-6 L3HSBM6	Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM6	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. Layer 3 IP DA Inverse Match Enable

Table continues on the next page...

Field	Description
	When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0 - Layer 3 IP DA Inverse Match is disabled 1 - Layer 3 IP DA Inverse Match is enabled
4 L3DAM6	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0 - Layer 3 IP DA Match is disabled 1 - Layer 3 IP DA Match is enabled
3 L3SAIM6	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0 - Layer 3 IP SA Inverse Match is disabled 1 - Layer 3 IP SA Inverse Match is enabled
2 L3SAM6	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0 - Layer 3 IP SA Match is disabled 1 - Layer 3 IP SA Match is enabled
1 —	Reserved
0 L3PEN6	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

11.7.6.1.314 Layer 4 Address 6 (MAC_LAYER4_ADDRESS6)

The MAC_LAYER4_ADDRESS(#i), MAC_L3_L4_CONTROL(#i), MAC_LAYER3_ADDR0_Reg(#i), MAC_LAYER3_ADDR1_Reg(#i), MAC_LAYER3_ADDR2_Reg(#i) and MAC_LAYER3_ADDR3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

11.7.6.1.317.3 Fields

Field	Description
31-0 L3A26	Layer 3 Address 2 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets. Layer 3 Address 2 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset in the MAC_L3_L4_CONTROL0 register, this field is not used.

11.7.6.1.318 Layer 3 Address 3 Register 6 (MAC_LAYER3_ADDR3_REG6)

The Layer 3 Address 3 Register 6 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

11.7.6.1.319.3 Fields

Field	Description
31-29 —	Reserved
28 DMCHEN7	DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter. 0 - DMA Channel Select is disabled 1 - DMA Channel Select is enabled
27 —	Reserved
26-24 DMCHN7	DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23-22 —	Reserved
21 L4DPIM7	Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

Table continues on the next page...

Field	Description
	This bit is valid and applicable only when the L4DPM0 bit is set high. 0 - Layer 4 Destination Port Inverse Match is disabled 1 - Layer 4 Destination Port Inverse Match is enabled
20 L4DPM7	Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching. 0 - Layer 4 Destination Port Match is disabled 1 - Layer 4 Destination Port Match is enabled
19 L4SPIM7	Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high. 0 - Layer 4 Source Port Inverse Match is disabled 1 - Layer 4 Source Port Inverse Match is enabled
18 L4SPM7	Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching. 0 - Layer 4 Source Port Match is disabled 1 - Layer 4 Source Port Match is enabled
17 —	Reserved
16 L4PEN7	Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching. The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set. 0 - Layer 4 Protocol is disabled 1 - Layer 4 Protocol is enabled
15-11 L3HDBM7	Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field:

Table continues on the next page...

Field	Description
	- 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10-6 L3HSBM7	Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM7	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0 - Layer 3 IP DA Inverse Match is disabled 1 - Layer 3 IP DA Inverse Match is enabled
4 L3DAM7	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. Layer 3 IP DA Match Enable

Table continues on the next page...

Field	Description
	When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0 - Layer 3 IP DA Match is disabled 1 - Layer 3 IP DA Match is enabled
3 L3SAIM7	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0 - Layer 3 IP SA Inverse Match is disabled 1 - Layer 3 IP SA Inverse Match is enabled
2 L3SAM7	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0 - Layer 3 IP SA Match is disabled 1 - Layer 3 IP SA Match is enabled
1 —	Reserved
0 L3PEN7	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

11.7.6.1.320 Layer 4 Address 7 (MAC_LAYER4_ADDRESS7)

The MAC_LAYER4_ADDRESS(#i), MAC_L3_L4_CONTROL(#i), MAC_LAYER3_ADDR0_Reg(#i), MAC_LAYER3_ADDR1_Reg(#i), MAC_LAYER3_ADDR2_Reg(#i) and MAC_LAYER3_ADDR3_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

11.7.6.1.320.3 Fields

Field	Description
31-16 L4DP7	Layer 4 Destination Port Number Field When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. Layer 4 Destination Port Number Field

Table continues on the next page...

Field	Description
	When the L4PEN0 bit is reset and the L4DPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4DPM0 bits are set in MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.
15-0 L4SP7	Layer 4 Source Port Number Field When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. Layer 4 Source Port Number Field When the L4PEN0 bit is reset and the L4SPM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets. When the L4PEN0 and L4SPM0 bits are set in MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

11.7.6.1.321 Layer 3 Address 0 Register 7 (MAC_LAYER3_ADDR0_REG7)

For IPv4 packets, the Layer 3 Address 0 Register 7 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

11.7.6.1.321.1 Offset

11.7.6.1.325.3 Fields

Field	Description
31-29 —	Reserved
28 AV8021ASMEN	AV 802. AV 802.1AS Mode Enable When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS mode of operation. When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit. 0 - AV 802.1AS Mode is disabled 1 - AV 802.1AS Mode is enabled
27-25 —	Reserved
24 TXTSSTSM	Transmit Timestamp Status Mode When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. Transmit Timestamp Status Mode When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS register. When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS register. 0 - Transmit Timestamp Status Mode is disabled 1 - Transmit Timestamp Status Mode is enabled
23-21 —	Reserved
20 ESTI	External System Time Input When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: - To take the timestamp provided as status - To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. External System Time Input When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: - To take the timestamp provided as status - To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. When this bit is reset, the MAC uses the internal reference System Time. 0 - External System Time Input is disabled 1 - External System Time Input is enabled
19 CSC	Enable checksum correction during OST for PTP over UDP/IPv4 packets When this bit is set, the last two bytes of PTP message sent over UDP/IPv4 is updated to keep the UDP checksum correct, for changes made to origin timestamp and/or correction field as part of one step timestamp operation. Enable checksum correction during OST for PTP over UDP/IPv4 packets

Table continues on the next page...

Field	Description
	When this bit is set, the last two bytes of PTP message sent over UDP/IPv4 is updated to keep the UDP checksum correct, for changes made to origin timestamp and/or correction field as part of one step timestamp operation. The application shall form the packet with these two dummy bytes. When reset, no updates are done to keep the UDP checksum correct. The application shall form the packet with UDP checksum set to 0. 0 - checksum correction during OST for PTP over UDP/IPv4 packets is disabled 1 - checksum correction during OST for PTP over UDP/IPv4 packets is enabled
18 TSENMACADDR	Enable MAC Address for PTP Packet Filtering When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. Enable MAC Address for PTP Packet Filtering When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet. For normal time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching. For PTP offload, only MAC address register 0 is considered for unicast destination address matching. 0 - MAC Address for PTP Packet Filtering is disabled 1 - MAC Address for PTP Packet Filtering is enabled
17-16 SNAPTYPSEL	Select PTP packets for Taking Snapshots These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. Select PTP packets for Taking Snapshots These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.
15 TSMSTRENA	Enable Snapshot for Messages Relevant to Master When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Enable Snapshot for Messages Relevant to Master When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node. 0 - Snapshot for Messages Relevant to Master is disabled 1 - Snapshot for Messages Relevant to Master is enabled
14 TSEVNTENA	Enable Timestamp Snapshot for Event Messages When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). Enable Timestamp Snapshot for Event Messages When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table. 0 - Timestamp Snapshot for Event Messages is disabled 1 - Timestamp Snapshot for Event Messages is enabled
13 TSIPV4ENA	Enable Processing of PTP Packets Sent over IPv4-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. Enable Processing of PTP Packets Sent over IPv4-UDP

Table continues on the next page...

Field	Description
	When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default. 0 - Processing of PTP Packets Sent over IPv4-UDP is disabled 1 - Processing of PTP Packets Sent over IPv4-UDP is enabled
12 TSIPV6ENA	Enable Processing of PTP Packets Sent over IPv6-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. Enable Processing of PTP Packets Sent over IPv6-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets. 0 - Processing of PTP Packets Sent over IPv6-UDP is disabled 1 - Processing of PTP Packets Sent over IPv6-UDP is enabled
11 TSIPENA	Enable Processing of PTP over Ethernet Packets When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. Enable Processing of PTP over Ethernet Packets When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets. 0 - Processing of PTP over Ethernet Packets is disabled 1 - Processing of PTP over Ethernet Packets is enabled
10 TSVER2ENA	Enable PTP Packet Processing for Version 2 Format When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. Enable PTP Packet Processing for Version 2 Format When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'. 0 - PTP Packet Processing for Version 2 Format is disabled 1 - PTP Packet Processing for Version 2 Format is enabled
9 TSCTRLSSR	Timestamp Digital or Binary Rollover Control When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. Timestamp Digital or Binary Rollover Control When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit. 0 - Timestamp Digital or Binary Rollover Control is disabled 1 - Timestamp Digital or Binary Rollover Control is enabled
8 TSENALL	Enable Timestamp for All Packets When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC. 0 - Timestamp for All Packets disabled 1 - Timestamp for All Packets enabled
7 —	Reserved

Table continues on the next page...

Field	Description
6 PTGE	Presentation Time Generation Enable When this bit is set the Presentation Time generation will be enabled. 0 - Presentation Time Generation is disabled 1 - Presentation Time Generation is enabled
5 TSADDREG	Update Addend Register When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. Update Addend Register When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Addend Register is not updated 1 - Addend Register is updated
4 —	Reserved
3 TSUPDT	Update Timestamp When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. Update Timestamp When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated. When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Timestamp is not updated 1 - Timestamp is updated
2 TSINIT	Initialize Timestamp When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. Initialize Timestamp When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized. When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Timestamp is not initialized 1 - Timestamp is initialized
1 TSCFUPDT	Fine or Coarse Timestamp Update When this bit is set, the Fine method is used to update system timestamp. Fine or Coarse Timestamp Update

Table continues on the next page...

Field	Description
	When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp. 0 - Coarse method is used to update system timestamp 1 - Fine method is used to update system timestamp
0 TSENA	Enable Timestamp When this bit is set, the timestamp is added for Transmit and Receive packets. Enable Timestamp When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode. On the Receive side, the MAC processes the 1588 packets only if this bit is set. 0 - Timestamp is disabled 1 - Timestamp is enabled

11.7.6.1.326 Subsecond Increment (MAC_SUB_SECOND_INCREMENT)

This register specifies the value to be added to the internal system time register every cycle of clk_ptp_ref_i clock.

11.7.6.1.326.1 Offset

Register	Offset
MAC_SUB_SECOND_INCREMENT	B04h

11.7.6.1.326.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

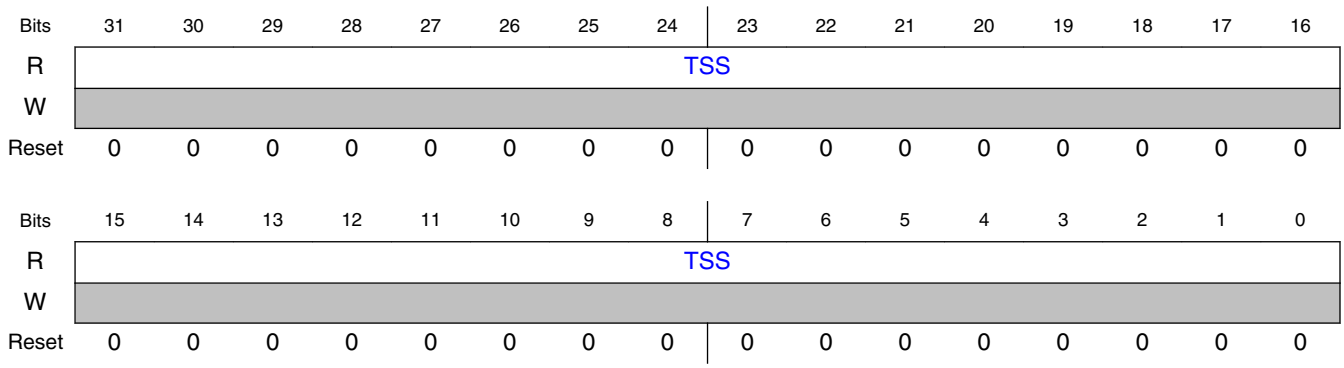
11.7.6.1.326.3 Fields

Field	Description
31-24 —	Reserved
23-16 SSINC	Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in TIMESTAMP_CONTROL]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.
15-8 SNSINC	Sub-nanosecond Increment Value This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8. Sub-nanosecond Increment Value This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8. This value is accumulated with the sub-nanoseconds field of the subsecond register. For example, when TSCTRLSSR field in the TIMESTAMP_CONTROL register is set. and if the required increment is 5.3ns, then SSINC should be 0x05 and SNSINC should be 0x4C.
7-0 —	Reserved



11.7.6.1.327 System Time Seconds (MAC_SYSTEM_TIME_SECONDS)

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk_ptp_ref_i to CSR clock).

11.7.6.1.327.1 Offset

Register	Offset
MAC_SYSTEM_TIME_SECONDS	B08h

11.7.6.1.330.3 Fields

Field	Description
31 ADDSUB	Add or Subtract Time When this bit is set, the time value is subtracted with the contents of the update register. Add or Subtract Time When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register. 0 - Add time 1 - Subtract time
30-0 TSSS	Timestamp Sub Seconds The value in this field is the sub-seconds part of the update. Timestamp Sub Seconds The value in this field is the sub-seconds part of the update. When ADDSUB is reset, this field must be programmed with the sub-seconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the TIMESTAMP_CONTROL register. When ADDSUB is set, this field must be programmed with the complement of the sub-seconds part of the update value as described below. When TSCTRLSSR bit in MAC_TIMESTAMP_CONTROL is set, the programmed value must be 10^9 - <sub-second value>. When TSCTRLSSR bit in MAC_TIMESTAMP_CONTROL is reset, the programmed value must be 2^31 - <sub-second_value>. When the TSCTRLSSR bit is reset in the TMAC_IMESTAMP_CONTROL register, each bit represents an accuracy of 0.46 ns. When the TSCTRLSSR bit is set in the MAC_TIMESTAMP_CONTROL register, each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF. For example, if 2.000000001 seconds need to be subtracted from the system time, then the TSSS field in the MAC_Timestamp_Nanoseconds_Update register must be 0x7FFF_FFFF (that is, 2^31 - 1), when TSCTRLSSR bit in MAC_TIMESTAMP_CONTROL is reset and 0x3B9A_C9FF (that is, 10^9 - 1), when TSCTRLSSR bit in MAC_TIMESTAMP_CONTROL is set.

11.7.6.1.331 Timestamp Addend (MAC_TIMESTAMP_ADDEND)

Timestamp Addend register. This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the MAC_TIMESTAMP_CONTROL register). The content of this register is added to a 32-bit accumulator in every clock cycle (of clk_ptp_ref_i) and the system time is updated whenever the accumulator overflows.

11.7.6.1.333.3 Fields

Field	Description
31-30 —	Reserved
29-25 ATSNS	Number of Auxiliary Timestamp Snapshots This field indicates the number of Snapshots available in the FIFO. Number of Auxiliary Timestamp Snapshots This field indicates the number of Snapshots available in the FIFO. A value equal to the selected depth of FIFO (4, 8, or 16) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.
24 ATSSTM	Auxiliary Timestamp Snapshot Trigger Missed This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. Auxiliary Timestamp Snapshot Trigger Missed This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. 0 - Auxiliary Timestamp Snapshot Trigger Missed status not detected

Table continues on the next page...

Field	Description
	1 - Auxiliary Timestamp Snapshot Trigger Missed status detected
23-20 —	Reserved
19-16 ATSSTN	Auxiliary Timestamp Snapshot Trigger Identifier These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. Auxiliary Timestamp Snapshot Trigger Identifier These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list: - Bit 16: Auxiliary trigger 0 - Bit 17: Auxiliary trigger 1 - Bit 18: Auxiliary trigger 2 - Bit 19: Auxiliary trigger 3 The software can read this register to find the triggers that are set when the timestamp is taken. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15 TXTSSIS	Tx Timestamp Status Interrupt Status In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS and MAC_TX_TIMESTAMP_STATUS_SECONDS registers. Tx Timestamp Status Interrupt Status In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS and TMAC_X_TIMESTAMP_STATUS_SECONDS registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS and MAC_TX_TIMESTAMP_STATUS_SECONDS registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the MAC_TX_TIMESTAMP_STATUS_SECONDS register is read (or write to MAC_TX_TIMESTAMP_STATUS_SECONDS register when RCWE bit of CSR_SW_CTRL register is set). 0 - Tx Timestamp Status Interrupt status not detected 1 - Tx Timestamp Status Interrupt status detected
14-10 —	Reserved
9 TSTRGTERR3	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS registers elapses. Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Error status not detected

Table continues on the next page...

Field	Description
	1 - Timestamp Target Time Error status detected
8 TSTARGT3	Timestamp Target Time Reached for Target Time PPS3 When this bit is set, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS registers. Timestamp Target Time Reached for Target Time PPS3 When this bit is set, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Reached for Target Time PPS3 status not detected 1 - Timestamp Target Time Reached for Target Time PPS3 status detected
7 TSTRGTERR2	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS registers elapses. Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Error status not detected 1 - Timestamp Target Time Error status detected
6 TSTARGT2	Timestamp Target Time Reached for Target Time PPS2 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS registers. Timestamp Target Time Reached for Target Time PPS2 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Reached for Target Time PPS2 status not detected 1 - Timestamp Target Time Reached for Target Time PPS2 status detected
5 TSTRGTERR1	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS registers elapses. Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Error status not detected 1 - Timestamp Target Time Error status detected

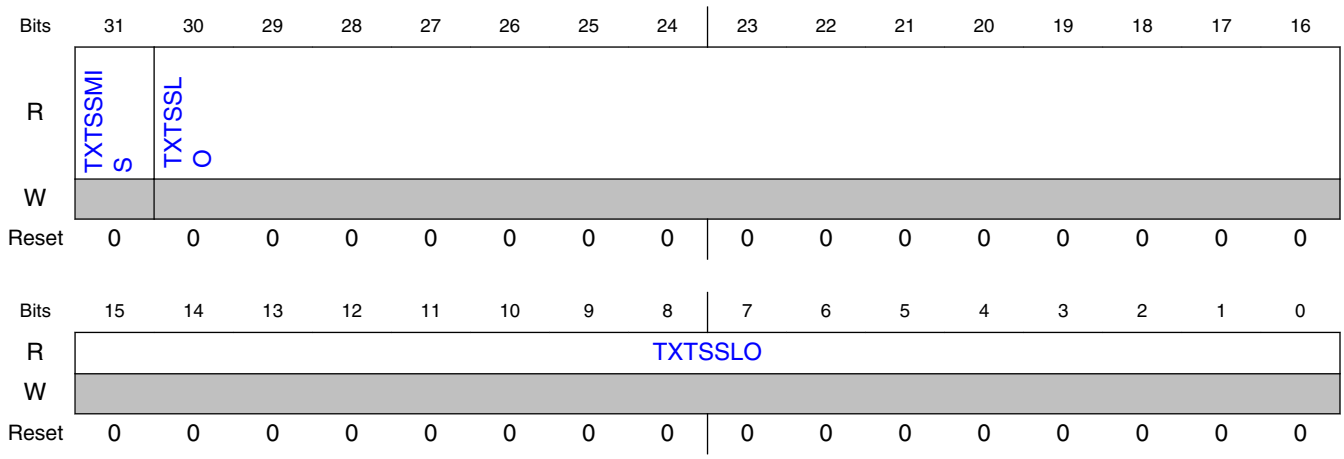
Table continues on the next page...

Field	Description
4 TSTARGT1	Timestamp Target Time Reached for Target Time PPS1 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS registers. Timestamp Target Time Reached for Target Time PPS1 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Reached for Target Time PPS1 status not detected 1 - Timestamp Target Time Reached for Target Time PPS1 status detected
3 TSTRGTERR0	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers elapses. Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_TARGET_TIME_NANOSECONDS registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Error status not detected 1 - Timestamp Target Time Error status detected
2 AUXTSTRIG	Auxiliary Timestamp Trigger Snapshot This bit is set high when the auxiliary snapshot is written to the FIFO. Auxiliary Timestamp Trigger Snapshot This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Auxiliary Timestamp Trigger Snapshot status not detected 1 - Auxiliary Timestamp Trigger Snapshot status detected
1 TSTARGT0	Timestamp Target Time Reached When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers. Timestamp Target Time Reached When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_TARGET_TIME_SECONDS and MAC_PPS0_TARGET_TIME_NANOSECONDS registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Reached status not detected 1 - Timestamp Target Time Reached status detected
0 TSSOVF	Timestamp Seconds Overflow When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Timestamp Seconds Overflow

Field	Description
	When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Seconds Overflow status not detected 1 - Timestamp Seconds Overflow status detected

11.7.6.1.334 Transmit Timestamp Status Nanoseconds (MAC_TX_TIMESTAMP_STATUS_NANOSECONDS)

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled.



The MAC_TX_TIMESTAMP_STATUS_NANOSECONDS register, along with MAC_TX_TIMESTAMP_STATUS_SECONDS, gives the 64-bit timestamp captured for the PTP packet successfully transmitted by the MAC. This value is considered to be read by the application when the last byte of MAC_TX_TIMESTAMP_STATUS_NANOSECONDS is read. In the little-endian mode, this means when bits[31:24] are read; in big-endian mode, bits[7:0] are read.

If the application does not read these registers and timestamp of another packet is captured, then either the current timestamp is lost (overwritten) or the new timestamp is lost (dropped), depending on the setting of the TXTSSTSM bit of the MAC_TIMESTAMP_CONTROL register. The status bit TXTSC bit [15] in MAC_TIMESTAMP_STATUS register is set whenever the MAC transmitter captures the timestamp.

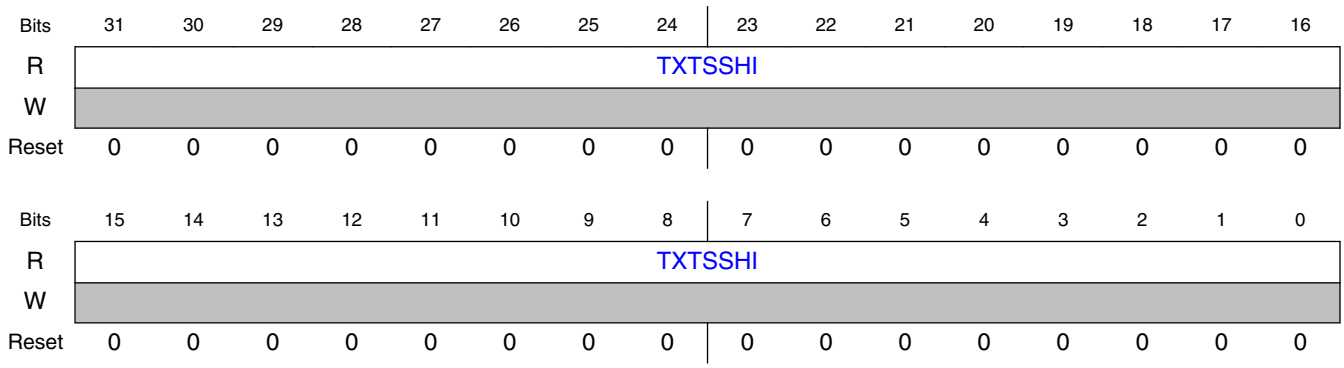
11.7.6.1.334.1 Offset

Register	Offset
MAC_TX_TIMESTAMP_STATUS_NANOSECONDS	B30h

11.7.6.1.334.2 Diagram

11.7.6.1.334.3 Fields

Field	Description
31 TXTSSMIS	Transmit Timestamp Status Missed When this bit is set, it indicates one of the following: - The timestamp of the current packet is ignored if TXTSSTSM bit of the TIMESTAMP_CONTROL register is reset - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the MAC_TIMESTAMP_CONTROL register is set. Transmit Timestamp Status Missed When this bit is set, it indicates one of the following: - The timestamp of the current packet is ignored if TXTSSTSM bit of the TIMESTAMP_CONTROL register is reset - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the MAC_TIMESTAMP_CONTROL register is set. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Transmit Timestamp Status Missed status not detected 1 - Transmit Timestamp Status Missed status detected
30-0 TXTSSLO	Transmit Timestamp Status Low This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.



11.7.6.1.335 Transmit Timestamp Status Seconds (MAC_TX_TIMESTAMP_STATUS_SECONDS)

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

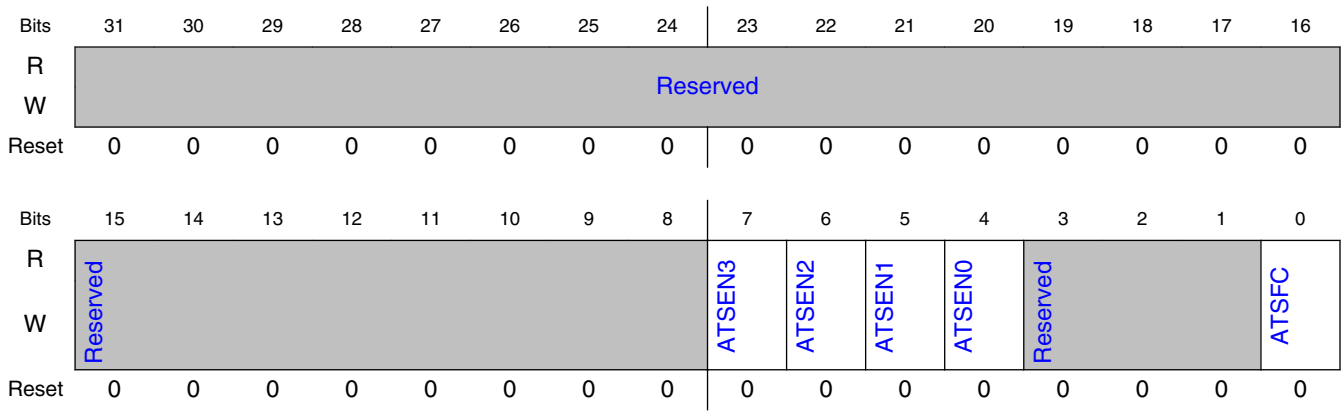
11.7.6.1.335.1 Offset

Register	Offset
MAC_TX_TIMESTAMP_STATUS_SECONDS	B34h

11.7.6.1.335.2 Diagram

11.7.6.1.335.3 Fields

Field	Description
31-0 TXTSSHI	Transmit Timestamp Status High This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.



11.7.6.1.336 Auxiliary Timestamp Control (MAC_AUXILIARY_CONTROL)

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

11.7.6.1.336.1 Offset

Register	Offset
MAC_AUXILIARY_CONTROL	B40h

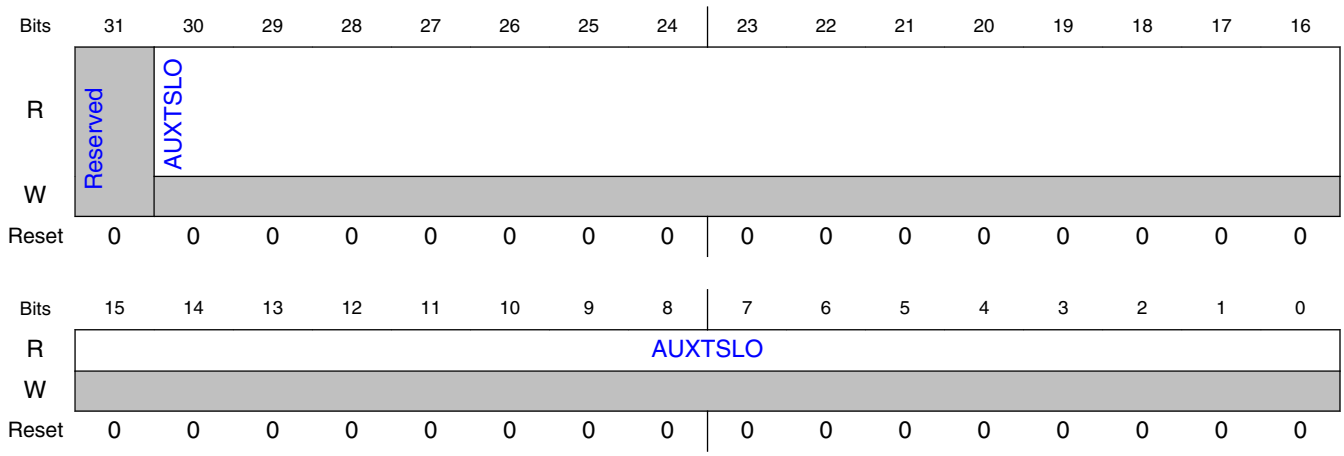
11.7.6.1.336.3 Fields

Field	Description
31-8 —	Reserved
7 ATSEN3	Auxiliary Snapshot 3 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 3. Auxiliary Snapshot 3 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 3. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[3] input is enabled. When this bit is reset, the events on this input are ignored. 0 - Auxiliary Snapshot $i is disabled 1 - Auxiliary Snapshot $i is enabled
6 ATSEN2	Auxiliary Snapshot 2 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 2. Auxiliary Snapshot 2 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 2. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[2] input is enabled. When this bit is reset, the events on this input are ignored. 0 - Auxiliary Snapshot $i is disabled 1 - Auxiliary Snapshot $i is enabled
5 ATSEN1	Auxiliary Snapshot 1 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 1. Auxiliary Snapshot 1 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[1] input is enabled. When this bit is reset, the events on this input are ignored. 0 - Auxiliary Snapshot $i is disabled 1 - Auxiliary Snapshot $i is enabled
4 ATSEN0	Auxiliary Snapshot 0 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 0. Auxiliary Snapshot 0 Enable

Table continues on the next page...

Field	Description
	This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[0] input is enabled. When this bit is reset, the events on this input are ignored. 0 - Auxiliary Snapshot $i is disabled 1 - Auxiliary Snapshot $i is enabled
3-1 —	Reserved
0 ATSFC	Auxiliary Snapshot FIFO Clear When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. Auxiliary Snapshot FIFO Clear When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Auxiliary Snapshot FIFO Clear is disabled 1 - Auxiliary Snapshot FIFO Clear is enabled

11.7.6.1.337 Auxiliary Timestamp Nanoseconds (MAC_AUXILIARY_TIMESTAMP_NANOSECONDS)



The Auxiliary Timestamp Nanoseconds register, along with MAC_Auxiliary_Timestamp_Seconds, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4, 8, or 16 as selected while configuring the core.

You can store multiple snapshots in this FIFO. Bits[29:25] in MAC_TIMESTAMP_STATUS indicate the fill-level of the FIFO. The top of the FIFO is removed only when the last byte of MAC_AUXILIARY_TIMESTAMP_SECONDS register is read. In the little-endian mode, this means when Bits[31:24] are read and in big-endian mode, Bits[7:0] are read.

11.7.6.1.339.3 Fields

Field	Description
31-0 OSTIAC	One-Step Timestamp Ingress Asymmetry Correction This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. One-Step Timestamp Ingress Asymmetry Correction This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2^16. For example, 2.5 ns is represented as 0x00028000. The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

11.7.6.1.340 imestamp Egress Asymmetry Correction (MAC_TIMESTAMP_EGRESS_ASYM_CORR)

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

11.7.6.1.340.3 Fields

Field	Description
31-0 OSTEAC	One-Step Timestamp Egress Asymmetry Correction This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. One-Step Timestamp Egress Asymmetry Correction This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2^16. For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFD_8000, which is the 2's complement of 0x0002_8000(2.5 * 216). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * 216).

11.7.6.1.341 Timestamp Ingress Correction Nanosecond (MAC_TIMESTAMP_INGRESS_CORR_NANOSECOND)

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

Field	Description
31 MCGREN3	MCGR Mode Enable for PPS3 Output This field enables the 3rd PPS instance to operate in PPS or MCGR mode. MCGR Mode Enable for PPS3 Output

Table continues on the next page...

Field	Description
	This field enables the 3rd PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode.
30-29 TRGTMODSEL3	Target Time Register Mode for PPS3 Output This field indicates the Target Time registers (MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS) mode for PPS3 output signal. 00 - Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 01 - Reserved 10 - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 11 - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
28 —	Reserved
27-24 PPSCMD3	Flexible PPS3 Output Control This field controls the flexible PPS3 output (ptp_pps_o[3]) signal. Flexible PPS3 Output Control This field controls the flexible PPS3 output (ptp_pps_o[3]) signal. This field is similar to the PPSCMD0[2:0] field. If MCGREN3 is set, then PPSCMD3 indicated by these 4 bits [27:24] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 3. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN3 is not set then only 3 bits from [26:24] is used as PPSCMD3 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
23 MCGREN2	MCGR Mode Enable for PPS2 Output This field enables the 2nd PPS instance to operate in PPS or MCGR mode. MCGR Mode Enable for PPS2 Output This field enables the 2nd PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0 - 2nd PPS instance is disabled to operate in PPS or MCGR mode 1 - 2nd PPS instance is enabled to operate in PPS or MCGR mode
22-21 TRGTMODSEL2	Target Time Register Mode for PPS2 Output This field indicates the Target Time registers (MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS) mode for PPS2 output signal. 00 - Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 01 - Reserved 10 - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 11 - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
20 —	Reserved
19-16	Flexible PPS2 Output Control This field controls the flexible PPS2 output (ptp_pps_o[2]) signal.

Table continues on the next page...

Field	Description
PPSCMD2	Flexible PPS2 Output Control This field controls the flexible PPS2 output (ptp_pps_o[2]) signal. This field is similar to the PPSCMD0 field. If MCGREN2 is set, then PPSCMD2 indicated by these 4 bits [19:16] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 2. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN2 is not set then only 3 bits from [18:16] is used as PPSCMD2 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
15 MCGREN1	MCGR Mode Enable for PPS1 Output This field enables the 1st PPS instance to operate in PPS or MCGR mode. MCGR Mode Enable for PPS1 Output This field enables the 1st PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0 - 1st PPS instance is disabled to operate in PPS or MCGR mode 1 - 1st PPS instance is enabled to operate in PPS or MCGR mode
14-13 TRGTMODSEL1	Target Time Register Mode for PPS1 Output This field indicates the Target Time registers (MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS) mode for PPS1 output signal. 00 - Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 01 - Reserved 10 - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 11 - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
12 —	Reserved
11-8 PPSCMD1	Flexible PPS1 Output Control This field controls the flexible PPS1 output (ptp_pps_o[1]) signal. Flexible PPS1 Output Control This field controls the flexible PPS1 output (ptp_pps_o[1]) signal. This field is similar to the PPSCMD0 field. If MCGREN1 is set, then PPSCMD1 indicated by these 4 bits [11:8] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 1. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN1 is not set then only 3 bits from [10:8] is used as PPSCMD1 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
7 MCGREN0	MCGR Mode Enable for PPS0 Output This field enables the 0th PPS instance to operate in PPS or MCGR mode. MCGR Mode Enable for PPS0 Output This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0 - 0th PPS instance is enabled to operate in PPS mode 1 - 0th PPS instance is enabled to operate in MCGR mode

Table continues on the next page...

Field	Description
6-5 TRGTMODSEL0	Target Time Register Mode for PPS0 Output This field indicates the Target Time registers (MAC_PPS0_TARGET_TIME_SECONDS and MAC_PPS0_TARGET_TIME_NANOSECONDS) mode for PPS0 output signal: 00 - Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 01 - Reserved 10 - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 11 - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
4 PPSEN0	Flexible PPS Output Mode Enable When this bit is set, Bits[3:0] function as PPSCMD. Flexible PPS Output Mode Enable When this bit is set, Bits[3:0] function as PPSCMD. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode). 0 - Flexible PPS Output Mode is disabled 1 - Flexible PPS Output Mode is enabled
3-0 PPSCTRL_PPSCMD	PPS Output Frequency Control This field controls the frequency of the PPS0 output (ptp_pps_o[0]) signal. PPS Output Frequency Control This field controls the frequency of the PPS0 output (ptp_pps_o[0]) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies: - 0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. - 0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. - 0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz. - 0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz. - .. - 1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz. Note: In the binary rollover mode, the PPS output (ptp_pps_o) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example: - When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms - When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period Second clock of 463 ms period (268 ms low and 195 ms high) - When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period Fourth clock of 195 ms period (134 ms low and 61 ms high) This behavior is because of the non-linear toggling of bits in the digital rollover mode in the MAC_System_Time_Nanoseconds register.

Field	Description
	or Flexible PPS Output (ptp_pps_o[0]) Control Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all-zero'. The following list describes the values of PPSCMD0: - 0000: No Command - 0001: START Single Pulse This command generates single pulse rising at the start point defined in MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds register and of a duration defined in the PPS0 Width Register. - 0010: START Pulse Train This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS0 Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands. - 0011: Cancel START This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time. - 0100: STOP Pulse train at time This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010) after the time programmed in the Target Time registers elapses. - 0101: STOP Pulse Train immediately This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010). - 110: Cancel STOP Pulse train This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command. - 0111-1111: Reserved or Presentation Time Control If MCGREN0 is set then these bits are treated as Presentation time control bits. The following list describes the values of PPSCMD0: - 0000: No Operation related to MCGR will be carried out. If set to this value in the mid of clock recovery or generation all the processing inputs will be flushed. - 0001: Capture the Presentation time at rising edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0010: Capture the Presentation time at falling edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0011: Capture the Presentation time at both edges of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0100-1000: Reserved - 1001: Toggle output on compare - 1010: Pulse output low on compare for one PTP-clock cycle - 1011: Pulse output high on compare for one PTP-clock cycle

11.7.6.1.349.3 Fields

Field	Description
31 TRGTBUSY0	PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the PPS_CONTROL register is programmed to 010 or 011. PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_CONTROL register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. 0 - PPS Target Time Register Busy status is not detected 1 - PPS Target Time Register Busy is detected
30-0 TTSL0	Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. Target Time Low for PPS Register

Field	Description
	This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in PPS_CONTROL. When the TSCTRLSSR bit is reset in the MAC_TIMESTAMP_CONTROL register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_TIMESTAMP_CONTROL register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

11.7.6.1.350 PPS0 Interval (MAC_PPS0_INTERVAL)

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output (ptp_pps_o[0]).

11.7.6.1.350.1 Offset

Register	Offset
MAC_PPS0_INTERVAL	B88h

11.7.6.1.350.3 Fields

Field	Description
31-0 PPSINT0	PPS Output Signal Interval These bits store the interval between the rising edges of PPS0 signal output. PPS Output Signal Interval

Field	Description
	These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

11.7.6.1.351 PPS0 Width (MAC_PPS0_WIDTH)

The PPS0 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS0 signal output (ptp_pps_o[0]).

11.7.6.1.351.1 Offset

Register	Offset
MAC_PPS0_WIDTH	B8Ch

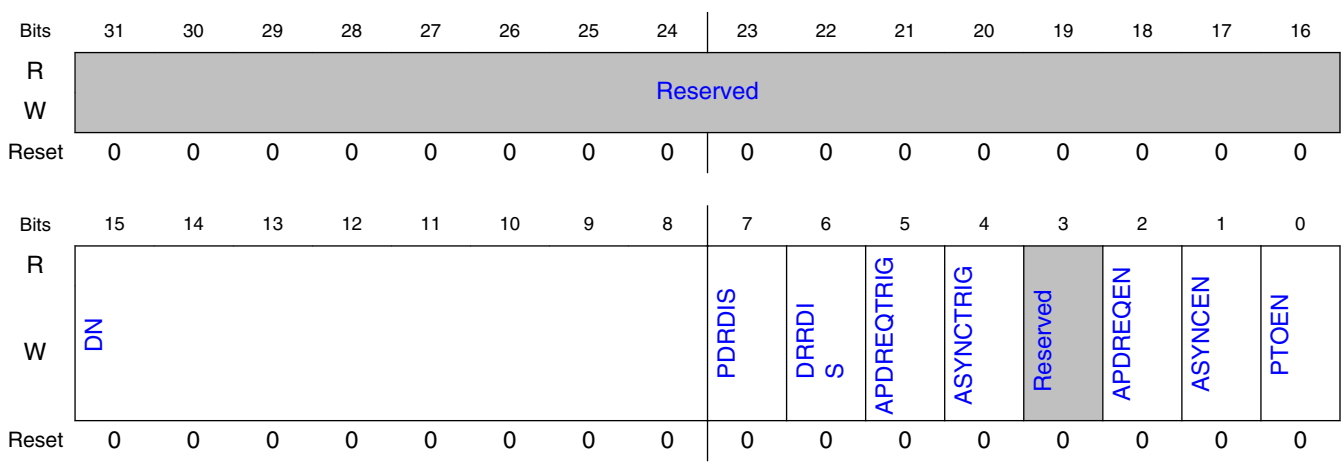
11.7.6.1.363.3 Fields

Field	Description
31-0 PPSWIDTH3	PPS Output Signal Width These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. PPS Output Signal Width

Field	Description
	These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

11.7.6.1.364 PTP Offload Engine Control (MAC_PTO_CONTROL)



This register controls the PTP Offload Engine operation.

This register controls the PTP Offload Engine operation. This register is available only when the Enable PTP Timestamp Offload feature is selected.

11.7.6.1.364.1 Offset

Table continues on the next page...

Field	Description
—	
15-8 DN	Domain Number This field indicates the domain Number in which the PTP node is operating. Domain Number This field indicates the domain Number in which the PTP node is operating.
7 PDRDIS	Disable Peer Delay Response response generation When this bit is set, the Peer Delay Response (Pdelay_Resp) response is not be generated for received Peer Delay Request (Pdelay_Req) request packet, as required by the programmed mode. Disable Peer Delay Response response generation When this bit is set, the Peer Delay Response (Pdelay_Resp) response is not be generated for received Peer Delay Request (Pdelay_Req) request packet, as required by the programmed mode. Note: Setting this bit to 1 affects the normal PTP Offload operation and the time synchronization. So, this bit must be set only if there is problem with Pdelay_Resp generation in Hardware and/or Pdelay_Resp generation is handled by Software. 0 - Peer Delay Response response generation is enabled 1 - Peer Delay Response response generation is disabled
6 DRRDIS	Disable PTO Delay Request/Response response generation When this bit is set, the Delay Request and Delay response is not generated for received SYNC and Delay request packet respectively, as required by the programmed mode. Disable PTO Delay Request/Response response generation When this bit is set, the Delay Request and Delay response is not generated for received SYNC and Delay request packet respectively, as required by the programmed mode. 0 - PTO Delay Request/Response response generation is enabled 1 - PTO Delay Request/Response response generation is disabled
5 APDREQTRIG	Automatic PTP Pdelay_Req message Trigger When this bit is set, one PTP Pdelay_Req message is transmitted. Automatic PTP Pdelay_Req message Trigger When this bit is set, one PTP Pdelay_Req message is transmitted. This bit is automatically cleared after the PTP Pdelay_Req message is transmitted. The application should set the APDREQEN bit for this operation. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Automatic PTP Pdelay_Req message Trigger is disabled 1 - Automatic PTP Pdelay_Req message Trigger is enabled
4 ASYNCTRIG	Automatic PTP SYNC message Trigger When this bit is set, one PTP SYNC message is transmitted. Automatic PTP SYNC message Trigger When this bit is set, one PTP SYNC message is transmitted. This bit is automatically cleared after the PTP SYNC message is transmitted. The application should set the ASYNCEN bit for this operation. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Automatic PTP SYNC message Trigger is disabled 1 - Automatic PTP SYNC message Trigger is enabled
3 —	Reserved
2 APDREQEN	Automatic PTP Pdelay_Req message Enable When this bit is set, PTP Pdelay_Req message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Peer-to-Peer Transparent mode.

Table continues on the next page...

Field	Description
	0 - Automatic PTP Pdelay_Req message is disabled 1 - Automatic PTP Pdelay_Req message is enabled
1 ASYNCEN	Automatic PTP SYNC message Enable When this bit is set, PTP SYNC message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Clock Master mode. 0 - Automatic PTP SYNC message is disabled 1 - Automatic PTP SYNC message is enabled
0 PTOEN	PTP Offload Enable When this bit is set, the PTP Offload feature is enabled. 0 - PTP Offload feature is disabled 1 - PTP Offload feature is enabled

11.7.6.1.365 Source Port Identity 0 (MAC_SOURCE_PORT_IDENTITY0)

This register contains Bits[31:0] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

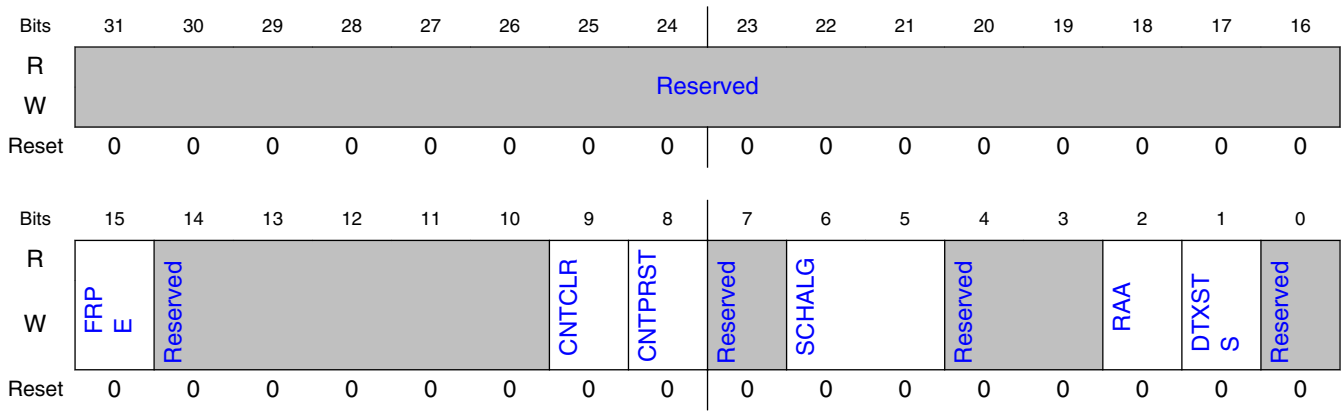
11.7.6.1.368.3 Fields

Field	Description
31-24 LMPDRI	Log Min Pdelay_Req Interval This field indicates logMinPdelayReqInterval of PTP node. Log Min Pdelay_Req Interval This field indicates logMinPdelayReqInterval of PTP node. This is used to schedule the periodic Pdelay request packet transmission. Allowed values are -15 to 15.Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.
23-11 —	Reserved
10-8 DRSYNCR	Delay_Req to SYNC Ratio In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted. Delay_Req to SYNC Ratio In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted. - 0: DelayReq generated for every received SYNC - 1: DelayReq generated every alternate reception of SYNC - 2: for every 4 SYNC messages - 3: for every 8 SYNC messages - 4: for every 16 SYNC messages - 5: for every 32 SYNC messages - 6-7: Reserved

Table continues on the next page...

Field	Description
	The master sends this information (logMinDelayReqInterval) in the DelayResp PTP messages to the slave. The DWC_ether_qos Receiver processes this value from the received DelayResp messages and updates this field accordingly. In the Slave mode, the host must not write/update this register unless it has to override the received value. In Master mode, the sum of this field and logSyncInterval (LSI) field is provided in the logMinDelayReqInterval field of the generated multicast Delay_Resp PTP message. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears. 000 - DelayReq generated for every received SYNC 001 - DelayReq generated every alternate reception of SYNC 010 - for every 4 SYNC messages 011 - for every 8 SYNC messages 100 - for every 16 SYNC messages 101 - for every 32 SYNC messages 110 - Reserved
7-0 LSI	Log Sync Interval This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Log Sync Interval This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.



11.7.6.1.369 MTL Operation Mode (MTL_OPERATION_MODE)

The Operation Mode register establishes the Transmit and Receive operating modes and commands.

15 STSIE	Transmit Status Available Interrupt Status Enable When this bit is set, an interrupt is generated when Transmit status is available in slave mode. 0 - Transmit Packet Available Interrupt Status is disabled 1 - Transmit Packet Available Interrupt Status is enabled
14 PKTIE	Receive Packet Available Interrupt Status Enable When this bit is set, an interrupt is generated when EOP of received packet is written to the Rx FIFO. 0 - Receive Packet Available Interrupt Status is disabled 1 - Receive Packet Available Interrupt Status is enabled
13-12 FIFOSEL	FIFO Selected for Access This field indicates the FIFO selected for debug access: 00 - Tx FIFO 01 - Tx Status FIFO (only read access when SLVMOD is set)

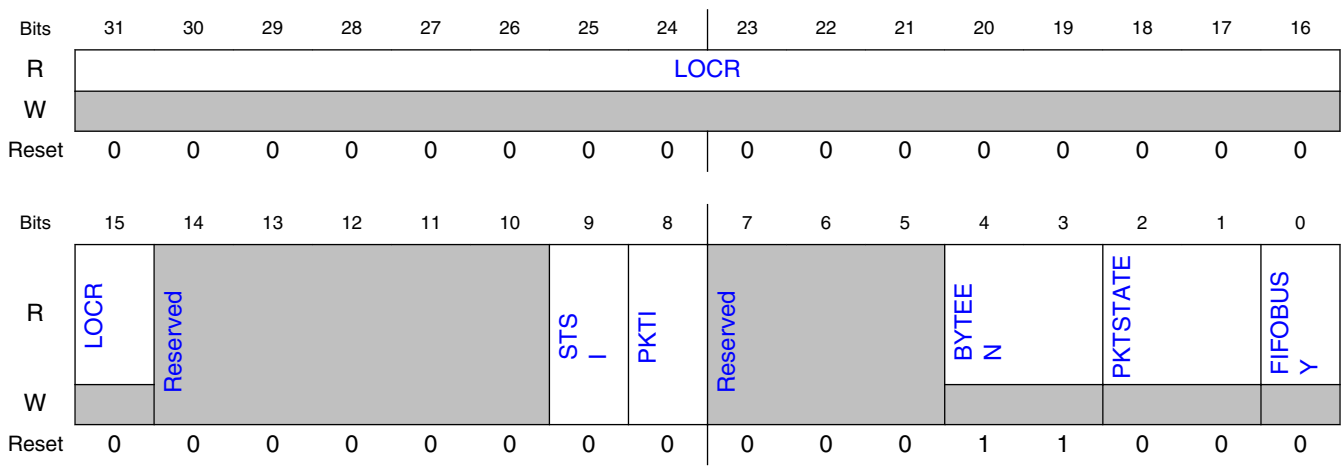
Table continues on the next page...

Field	Description
	10 - TSO FIFO (cannot be accessed when SLVMOD is set) 11 - Rx FIFO
11 FIFOWREN	FIFO Write Enable When this bit is set, it enables the Write operation on selected FIFO when FIFO Debug Access is enabled. FIFO Write Enable When this bit is set, it enables the Write operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0 - FIFO Write is disabled 1 - FIFO Write is enabled
10 FIFORDEN	FIFO Read Enable When this bit is set, it enables the Read operation on selected FIFO when FIFO Debug Access is enabled. FIFO Read Enable When this bit is set, it enables the Read operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0 - FIFO Read is disabled 1 - FIFO Read is enabled
9 RSTSEL	Reset Pointers of Selected FIFO When this bit is set, the pointers of the currently-selected FIFO are reset when FIFO Debug Access is enabled. Reset Pointers of Selected FIFO When this bit is set, the pointers of the currently-selected FIFO are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0 - Reset Pointers of Selected FIFO is disabled 1 - Reset Pointers of Selected FIFO is enabled
8 RSTALL	Reset All Pointers When this bit is set, the pointers of all FIFOs are reset when FIFO Debug Access is enabled. Reset All Pointers When this bit is set, the pointers of all FIFOs are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0 - Reset All Pointers is disabled 1 - Reset All Pointers is enabled
7 —	Reserved
6-5 PKTSTATE	Encoded Packet State This field is used to write the control information to the Tx FIFO or Rx FIFO. Encoded Packet State

Table continues on the next page...

Field	Description
	This field is used to write the control information to the Tx FIFO or Rx FIFO. Tx FIFO: - 00: Packet Data - 01: Control Word - 10: SOP Data - 11: EOP Data Rx FIFO: - 00: Packet Data - 01: Normal Status - 10: Last Status - 11: EOP 00 - Packet Data 01 - Control Word/Normal Status 10 - SOP Data/Last Status 11 - EOP Data/EOP
4 —	Reserved
3-2 BYTEEN	Byte Enables This field indicates the number of data bytes valid in the data register during Write operation. Byte Enables This field indicates the number of data bytes valid in the data register during Write operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected. 00 - Byte 0 valid 01 - Byte 0 and Byte 1 are valid 10 - Byte 0, Byte 1, and Byte 2 are valid 11 - All four bytes are valid
1 DBGMOD	Debug Mode Access to FIFO When this bit is set, it indicates that the current access to the FIFO is read, write, and debug access. Debug Mode Access to FIFO When this bit is set, it indicates that the current access to the FIFO is read, write, and debug access. In this mode, the following access types are allowed: - Read and Write access to Tx FIFO, TSO FIFO, and Rx FIFO - Read access is allowed to Tx Status FIFO. When this bit is reset, it indicates that the current access to the FIFO is slave access bypassing the DMA. In this mode, the following access are allowed: - Write access to the Tx FIFO - Read access to the Rx FIFO and Tx Status FIFO 0 - Debug Mode Access to FIFO is disabled 1 - Debug Mode Access to FIFO is enabled
0	FIFO Debug Access Enable When this bit is set, it indicates that the debug mode access to the FIFO is enabled.

Field	Description
FDBGEN	FIFO Debug Access Enable When this bit is set, it indicates that the debug mode access to the FIFO is enabled. When this bit is reset, it indicates that the FIFO can be accessed only through a master interface. 0 - FIFO Debug Access is disabled 1 - FIFO Debug Access is enabled



11.7.6.1.371 FIFO Debug Status (MTL_DBG_STS)

The FIFO Debug Status register contains the status of FIFO debug access.

11.7.6.1.371.1 Offset

Register	Offset
MTL_DBG_STS	C0Ch

11.7.6.1.371.2 Diagram

11.7.6.1.371.3 Fields

Field	Description
31-15 LOCR	Remaining Locations in the FIFO Slave Access Mode: This field indicates the space available in selected FIFO. Remaining Locations in the FIFO Slave Access Mode: This field indicates the space available in selected FIFO.

Table continues on the next page...

Field	Description
	Debug Access Mode: This field contains the Write or Read pointer value of the selected FIFO during Write or Read operation, respectively. Reset: In single Tx Queue configurations, (DWC_EQOS_TXFIFO_SIZE/(DWC_EQOS_DATAWIDTH/8)), Otherwise 0000H
14-10 —	Reserved
9 STSI	Transmit Status Available Interrupt Status When set, this bit indicates that the Slave mode Tx packet is transmitted, and the status is available in Tx Status FIFO. Transmit Status Available Interrupt Status When set, this bit indicates that the Slave mode Tx packet is transmitted, and the status is available in Tx Status FIFO. This bit is reset when 1 is written to this bit. 0 - Transmit Status Available Interrupt Status not detected 1 - Transmit Status Available Interrupt Status detected
8 PKTI	Receive Packet Available Interrupt Status When set, this bit indicates that MAC layer has written the EOP of received packet to the Rx FIFO. Receive Packet Available Interrupt Status When set, this bit indicates that MAC layer has written the EOP of received packet to the Rx FIFO. This bit is reset when 1 is written to this bit. 0 - Receive Packet Available Interrupt Status not detected 1 - Receive Packet Available Interrupt Status detected
7-5 —	Reserved
4-3 BYTEEN	Byte Enables This field indicates the number of data bytes valid in the data register during Read operation. Byte Enables This field indicates the number of data bytes valid in the data register during Read operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected. 00 - Byte 0 valid 01 - Byte 0 and Byte 1 are valid 10 - Byte 0, Byte 1, and Byte 2 are valid 11 - All four bytes are valid
2-1 PKTSTATE	Encoded Packet State This field is used to get the control or status information of the selected FIFO. Encoded Packet State This field is used to get the control or status information of the selected FIFO. Tx FIFO: - 00: Packet Data - 01: Control Word - 10: SOP Data - 11: EOP Data Rx FIFO:

Table continues on the next page...

Field	Description
	- 00: Packet Data - 01: Normal Status - 10: Last Status - 11: EOP This field is applicable only for Tx FIFO and Rx FIFO during Read operation. 00 - Packet Data 01 - Control Word/Normal Status 10 - SOP Data/Last Status 11 - EOP Data/EOP
0 FIFOBUSY	FIFO Busy When set, this bit indicates that a FIFO operation is in progress in the MAC and content of the following fields is not valid: - All other fields of this register - All fields of the MTL_FIFO_DEBUG_DATA register 0 - FIFO Busy not detected 1 - FIFO Busy detected

11.7.6.1.372 FIFO Debug Data (MTL_FIFO_DEBUG_DATA)

The FIFO Debug Data register contains the data to be written to or read from the FIFOs.

28 Q3DDMACH	Queue 3 Enabled for Dynamic (per packet) DMA Channel Selection When set, this bit indicates that the packets received in Queue 3 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. Queue 3 Enabled for Dynamic (per packet) DMA Channel Selection When set, this bit indicates that the packets received in Queue 3 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 3 are routed to the DMA Channel programmed in the Q3MDMACH field (Bits[26:24]). 0 - Queue 3 disabled for DA-based DMA Channel Selection 1 - Queue 3 enabled for DA-based DMA Channel Selection
27 —	Reserved
26-24 Q3MDMACH	Queue 3 Mapped to DMA Channel This field controls the routing of the received packet in Queue 3 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q3DDMACH field is reset. Queue 3 Mapped to DMA Channel This field controls the routing of the received packet in Queue 3 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1

Table continues on the next page...

Field	Description
	- 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q3DDMACH field is reset. Note: The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the others are reserved
23-21 —	Reserved
20 Q2DDMACH	Queue 2 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 2 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. Queue 2 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 2 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 2 are routed to the DMA Channel programmed in the Q2MDMACH field (Bits[18:16]). 0 - Queue 2 disabled for DA-based DMA Channel Selection 1 - Queue 2 enabled for DA-based DMA Channel Selection
19 —	Reserved
18-16 Q2MDMACH	Queue 2 Mapped to DMA Channel This field controls the routing of the received packet in Queue 2 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q2DDMACH field is reset.
15-13 —	Reserved
12 Q1DDMACH	Queue 1 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 1 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. Queue 1 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 1 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 1 are routed to the DMA Channel programmed in the Q1MDMACH field (Bits[10:8]). 0 - Queue 1 disabled for DA-based DMA Channel Selection 1 - Queue 1 enabled for DA-based DMA Channel Selection
11 —	Reserved

Table continues on the next page...

Field	Description
10-8 Q1MDMACH	Queue 1 Mapped to DMA Channel This field controls the routing of the received packet in Queue 1 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q1DDMACH field is reset. Queue 1 Mapped to DMA Channel This field controls the routing of the received packet in Queue 1 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q1DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7-5 —	Reserved
4 Q0DDMACH	Queue 0 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. Queue 0 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 0 are routed to the DMA Channel programmed in the Q0MDMACH field. 0 - Queue 0 disabled for DA-based DMA Channel Selection 1 - Queue 0 enabled for DA-based DMA Channel Selection
3 —	Reserved
2-0 Q0MDMACH	Queue 0 Mapped to DMA Channel This field controls the routing of the packet received in Queue 0 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q0DDMACH field is reset. Queue 0 Mapped to DMA Channel This field controls the routing of the packet received in Queue 0 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3

Field	Description
	- 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q0DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

11.7.6.1.375 Receive Queue and DMA Channel Mapping 1 (MTL_RXQ_DMA_MAP1)

The Receive Queue and DMA Channel Mapping 1 register is reserved in EQOS-CORE and EQOS-MTL configurations.

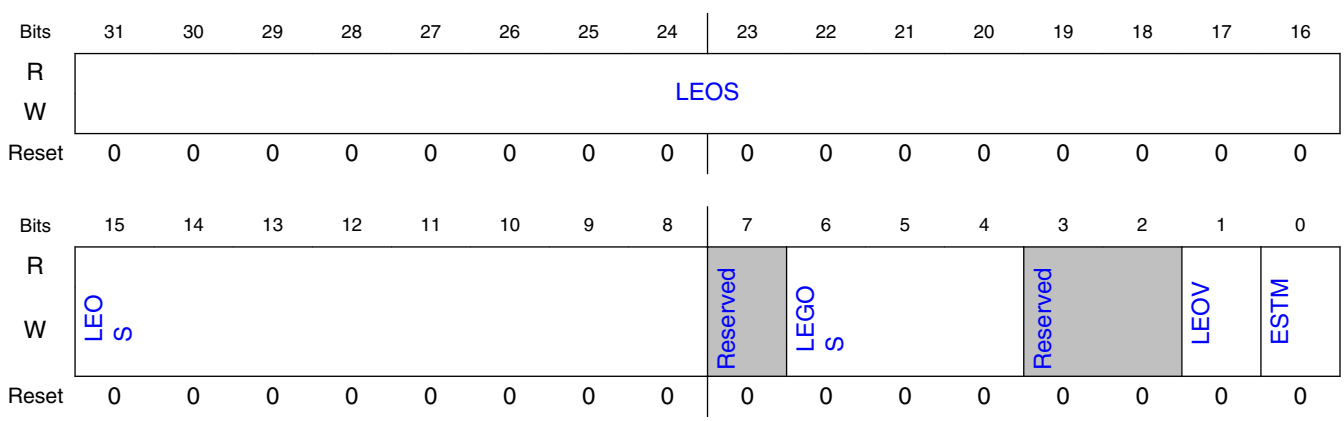
The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.



11.7.6.1.376 Time Based Scheduling Control (MTL_TBS_CTRL)

This register controls the operation of Time Based Scheduling.

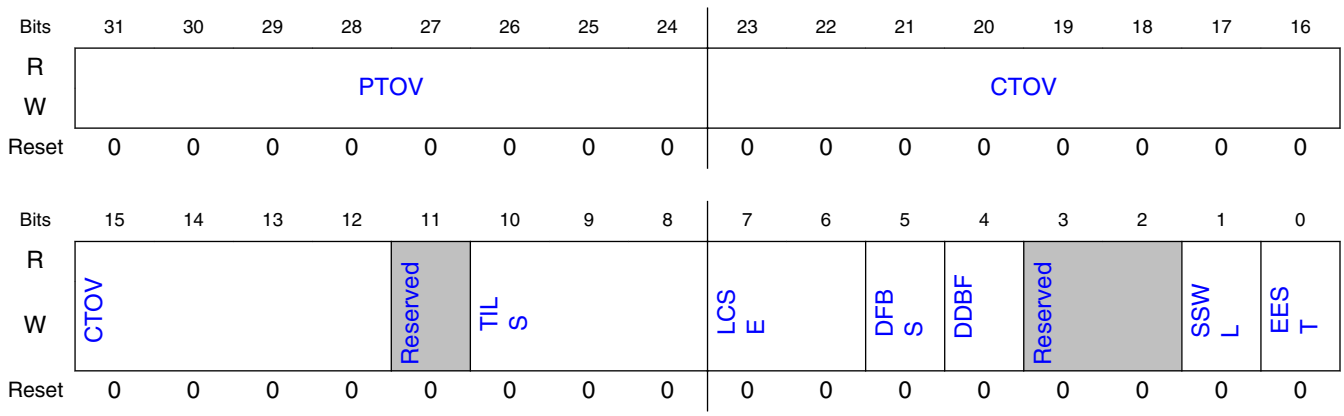
11.7.6.1.376.1 Offset

Register	Offset
MTL_TBS_CTRL	C40h

11.7.6.1.376.2 Diagram

11.7.6.1.376.3 Fields

Field	Description
31-8 LEOS	Launch Expiry Offset The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Launch Expiry Offset The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Value valid only when LEOV is set. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7 —	Reserved
6-4 LEGOS	Launch Expiry GSN Offset The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time. Launch Expiry GSN Offset The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time. Value valid only when LEOV is set.
3-2 —	Reserved
1 LEOV	Launch Expiry Offset Valid When set indicates the LEOS field is valid. Launch Expiry Offset Valid When set indicates the LEOS field is valid. When not set, indicates the Launch Expiry Offset is not valid and the MTL must not check for Launch expiry time. 0 - LEOS field is invalid 1 - LEOS field is valid
0 ESTM	EST offset Mode When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. EST offset Mode When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. When reset, the Launch Time value is used as an absolute value that should be compared with the System time [39:8]. 0 - EST offset Mode is disabled 1 - EST offset Mode is enabled



11.7.6.1.377 Enhancements to Scheduled Transmission Control (MTL_EST_CONTROL)

This register controls the operation of Enhancements to Scheduled Transmission (IEEE802.1Qbv).

11.7.6.1.377.1 Offset

Register	Offset
MTL_EST_CONTROL	C50h

11.7.6.1.377.2 Diagram

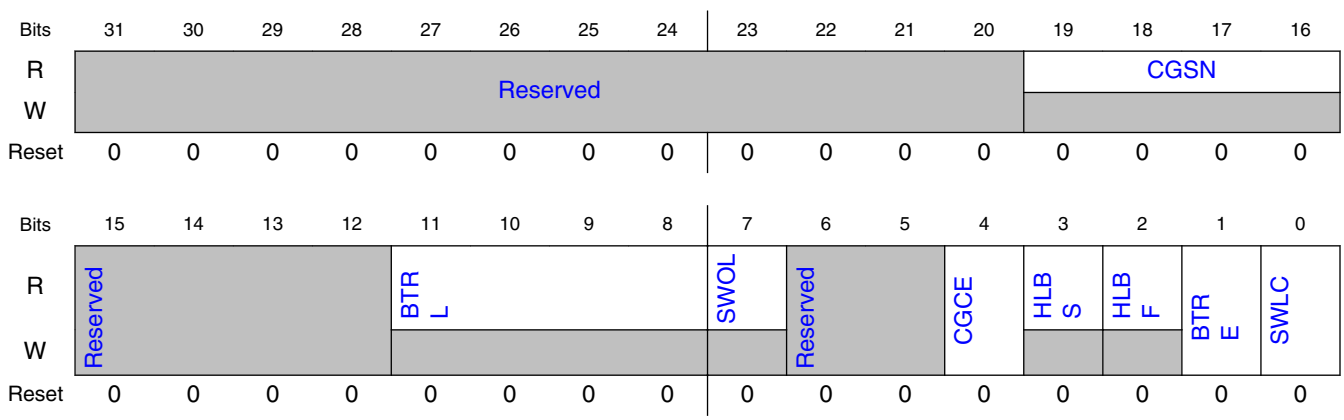
11.7.6.1.377.3 Fields

Field	Description
31-24 PTOV	PTP Time Offset Value The value of PTP Clock period multiplied by 6 in nanoseconds. PTP Time Offset Value The value of PTP Clock period multiplied by 6 in nanoseconds. This value is needed to avoid transmission overruns at the beginning of the installation of a new GCL.
23-12 CTOV	Current Time Offset Value Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays etc. Current Time Offset Value Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays etc. This offset helps to ensure that the impact of gate controls is visible on the line exactly at the pre-determined schedule (or as close to the schedule as possible).
11 —	Reserved
10-8 TILS	Time Interval Left Shift Amount This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists. Time Interval Left Shift Amount This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists.

Table continues on the next page...

Field	Description
	- 000: No left shift needed (equal to x1ns) - 001: Left shift TI by 1 bit (equal to x2ns) - 010: Left shift TI by 2 bits (equal to x4ns) - . - . - 100: Left shift TI by 7 bits (equal to x128ns) Based on the configuration one or more bits of this field should be treated as Reserved/Read-Only.
7-6 LCSE	Loop Count to report Scheduling Error Programmable number of GCL list iterations before reporting an HLBS error defined in EST_STATUS register. 00 - 4 iterations 01 - 8 iterations 10 - 16 iterations 11 - 32 iterations
5 DFBS	Drop Frames causing Scheduling Error When set frames reported to cause HOL Blocking due to not getting scheduled (HLBS field of EST_STATUS register) after 4,8,16,32 (based on LCSE field of this register) GCL iterations are dropped. 0 - Do not Drop Frames causing Scheduling Error 1 - Drop Frames causing Scheduling Error
4 DDBF	Do not Drop frames during Frame Size Error When set, frames are not be dropped during Head-of-Line blocking due to Frame Size Error (HLBF field of MTL_EST_STATUS register). 0 - Drop frames during Frame Size Error 1 - Do not Drop frames during Frame Size Error
3-2 —	Reserved
1 SSWL	Switch to S/W owned list When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Switch to S/W owned list When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Hardware clears this bit when the switch to the SWOL happens to indicate the completion of the switch or when an BTR error (BTRE in Status register) is set. When BTRE is set this bit is cleared but SWOL is not updated as the switch was not successful. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Switch to S/W owned list is disabled 1 - Switch to S/W owned list is enabled
0 EEST	Enable EST When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Enable EST When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Should be set for the hardware to start processing the gate control lists. During the toggle from 0 to 1, the gate control list processing starts only after the SSWL bit it set. When DWC_EQOS_ASP_ECC is selected during the configuration, if any uncorrectable error is detected in the EST memory the hardware will reset this bit and disable the EST function.

Field	Description
	0 - EST is disabled 1 - EST is enabled



11.7.6.1.378 Enhancements to Scheduled Transmission Status (MTL_EST_STATUS)

This register provides Status related to Enhancements to Scheduled Transmission (IEEE802.1Qbv).

11.7.6.1.378.1 Offset

Register	Offset
MTL_EST_STATUS	C58h

11.7.6.1.378.2 Diagram

11.7.6.1.378.3 Fields

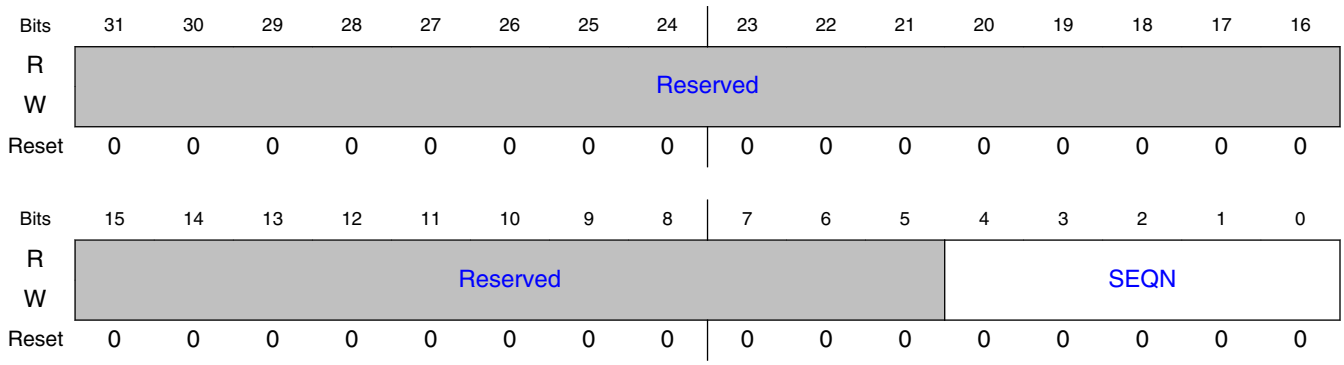
Field	Description
31-20 —	Reserved
19-16 CGSN	Current GCL Slot Number Indicates the slot number of the GCL list. Current GCL Slot Number

Table continues on the next page...

Field	Description
	Indicates the slot number of the GCL list. Slot number is a modulo 16 count of the GCL List loops executed so far. Even if a new GCL list is installed, the count is incremental.
15-12 —	Reserved
11-8 BTRL	BTR Error Loop Count Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. BTR Error Loop Count Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. N = "1111" indicates the iterations exceeded the value of 8 and the hardware was not able to update New BTR to be equal to or greater than Current Time. Software intervention is needed to update the New BTR. Value cleared when BTRE field of this register is cleared.
7 SWOL	S/W owned list When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. S/W owned list When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. Any reads/writes by the software (using indirect access via GCL_Control) is directed to the list indicated by this value by default. The inverse of this value is treated as HWOL. R/W operations performed by hardware are directed to the list pointed by HWOL by default. 0 - Gate control list number "0" is owned by software 1 - Gate control list number "1" is owned by software
6-5 —	Reserved
4 CGCE	Constant Gate Control Error This error occurs when the list length (LLR) is 1 and the programmed Time Interval (TI) value after the optional Left Shifting is less than or equal to the Cycle Time (CTR). Constant Gate Control Error This error occurs when the list length (LLR) is 1 and the programmed Time Interval (TI) value after the optional Left Shifting is less than or equal to the Cycle Time (CTR). The above programming implies Gates are either always Closed or always Open based on the Gate Control values; the same effect can be achieved by other simpler (non TSN) programming mechanisms. Since the implementation does not support such a programming an error is reported. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Constant Gate Control Error not detected 1 - Constant Gate Control Error detected
3 HLBS	Head-Of-Line Blocking due to Scheduling Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Head-Of-Line Blocking due to Scheduling Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Indicates to software a potential programming error. The one hot encoded values of the Queue Numbers that are not able to make progress are indicated in the MTL_EST_SCH_ERROR register. Bit cleared when MTL_EST_SCH_ERROR register is all zeroes. 0 - Head-Of-Line Blocking due to Scheduling not detected 1 - Head-Of-Line Blocking due to Scheduling detected

Table continues on the next page...

Field	Description
2 HLBF	Head-Of-Line Blocking due to Frame Size Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. Head-Of-Line Blocking due to Frame Size Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. The one hot encoded Queue numbers that are experiencing HLBF are indicated in the MTL_EST_FRM_SIZE_ERROR register. Additionally, the first Queue number that experienced HLBF along with the frame size is captured in MTL_EST_FRM_SIZE_CAPTURE register. Bit cleared when MTL_EST_FRAME_SIZE_ ERROR register is all zeros. 0 - Head-Of-Line Blocking due to Frame Size not detected 1 - Head-Of-Line Blocking due to Frame Size detected
1 BTRE	BTR Error When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. BTR Error When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. If the BTRL = "1111", SWOL is not updated and Software should reprogram the BTR to a value greater than current time and then set SSWL to reinitiate the switch to SWOL. Else if the value of BTRL < "1111", SWOL is updated and this field indicates the number of iterations (of + CycleTime) taken by hardware to update the BTR to a value greater than Current Time. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - BTR Error not detected 1 - BTR Error detected
0 SWLC	Switch to S/W owned list Complete When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Switch to S/W owned list Complete When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Cleared when the SSWL of MTL_EST_CONTROL register transitions from 0 to 1, or on a software write. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Switch to S/W owned list Complete not detected 1 - Switch to S/W owned list Complete detected



11.7.6.1.379 EST Scheduling Error (MTL_EST_SCH_ERROR)

This register provides the One Hot encoded Queue Numbers that are having the Scheduling related error (timeout).

11.7.6.1.379.1 Offset

Register	Offset
MTL_EST_SCH_ERROR	C60h

11.7.6.1.379.2 Diagram

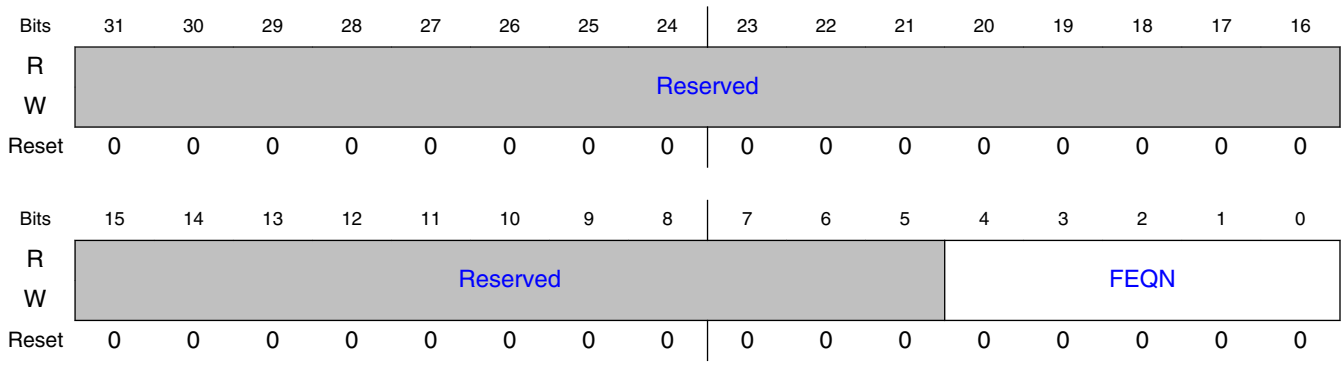
4-0 SEQN	Schedule Error Queue Number The One Hot Encoded Queue Numbers that have experienced error/timeout described in HLBS field of status register. Schedule Error Queue Number The One Hot Encoded Queue Numbers that have experienced error/timeout described in HLBS field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.



11.7.6.1.380 EST Frame Size Error (MTL_EST_FRM_SIZE_ERROR)

This register provides the One Hot encoded Queue Numbers that are having the Frame Size related error.

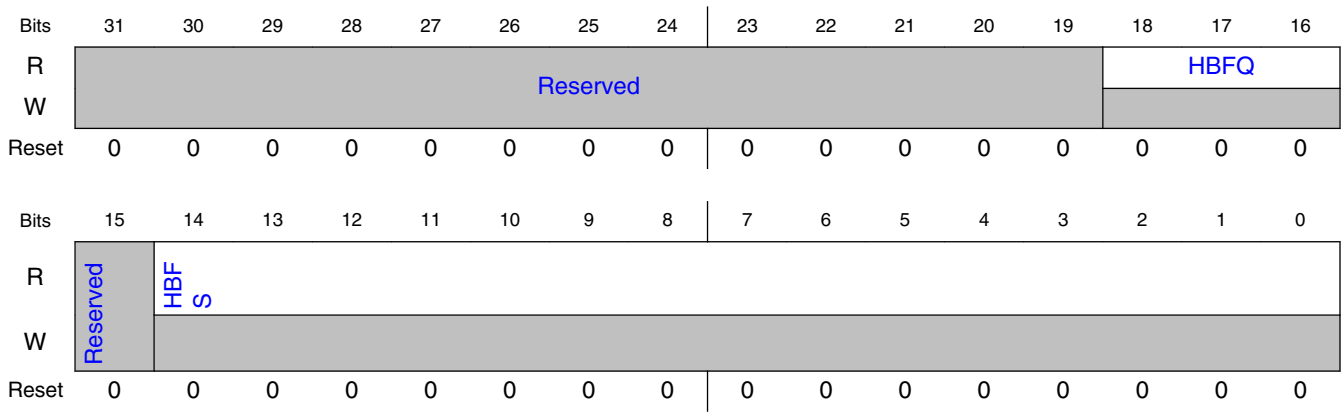
11.7.6.1.380.1 Offset

Register	Offset
MTL_EST_FRM_SIZE_ERROR	C64h

11.7.6.1.380.2 Diagram

11.7.6.1.380.3 Fields

Field	Description
31-5 —	Reserved
4-0 FEQN	Frame Size Error Queue Number The One Hot Encoded Queue Numbers that have experienced error described in HLBF field of status register. Frame Size Error Queue Number The One Hot Encoded Queue Numbers that have experienced error described in HLBF field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.



11.7.6.1.381 EST Frame Size Capture (MTL_EST_FRM_SIZE_CAPTURE)

This register captures the Frame Size and Queue Number of the first occurrence of the Frame Size related error. Up on clearing it captures the data of immediate next occurrence of a similar error.

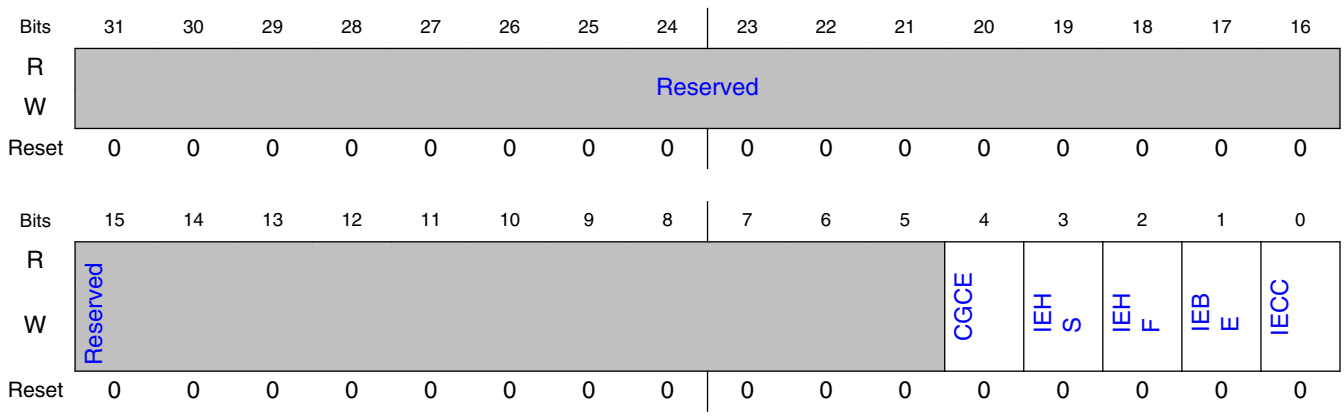
11.7.6.1.381.1 Offset

Register	Offset
MTL_EST_FRM_SIZE_CAPTURE	C68h

11.7.6.1.381.2 Diagram

11.7.6.1.381.3 Fields

Field	Description
31-19 —	Reserved
18-16 HBFQ	Queue Number of HLBF Captures the binary value of the of the first Queue (number) experiencing HLBF error (see HLBF field of status register). Queue Number of HLBF Captures the binary value of the of the first Queue (number) experiencing HLBF error (see HLBF field of status register). Value once written is not altered by any subsequent queue errors of similar nature. Once cleared the queue number of the next occurring HLBF error is captured. Width is based on the number of Tx Queues configured; remaining bits are Read-Only. Cleared when MTL_EST_FRM_SIZE_ERROR register is all zeros.
15 —	Reserved
14-0 HBFS	Frame Size of HLBF Captures the Frame Size of the dropped frame related to queue number indicated in HBFQ field of this register. Frame Size of HLBF Captures the Frame Size of the dropped frame related to queue number indicated in HBFQ field of this register. Contents of this register should be considered invalid, if this field is zero. Cleared when MTL_EST_FRM_SIZE_ERROR register is all zeros.



11.7.6.1.382 EST Interrupt Enable (MTL_EST_INTR_ENABLE)

This register implements the Interrupt Enable bits for the various events that generate an interrupt. Bit positions have a 1 to 1 correlation with the status bit positions in MTL_ETS_STATUS register.

11.7.6.1.382.1 Offset

Register	Offset
MTL_EST_INTR_ENABLE	C70h

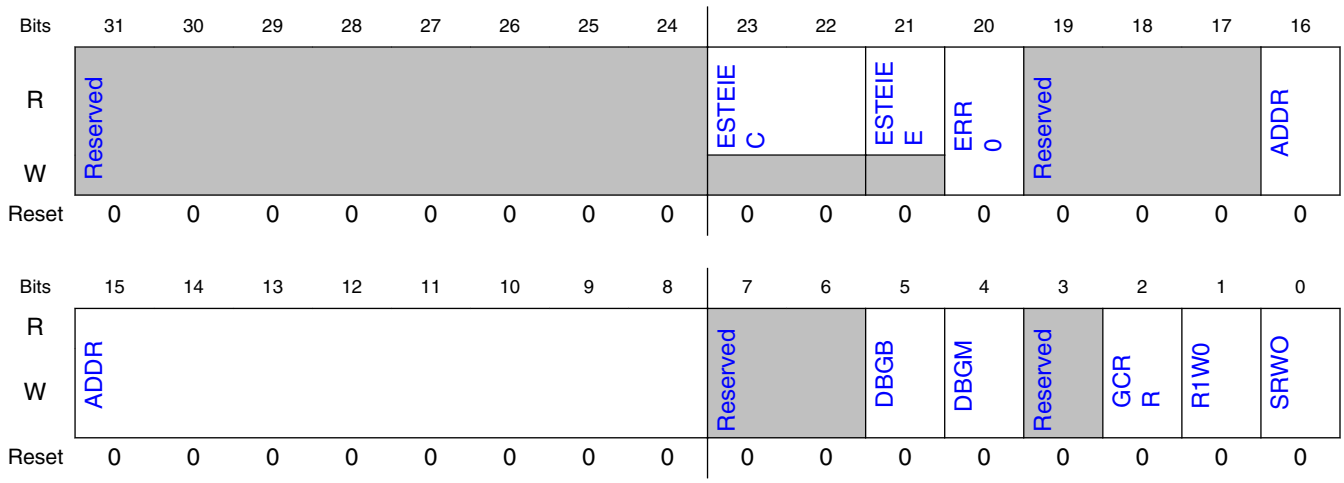
11.7.6.1.382.2 Diagram

11.7.6.1.382.3 Fields

Field	Description
31-5 —	Reserved
4 CGCE	Interrupt Enable for CGCE When set, generates interrupt when the Constant Gate Control Error occurs and is indicated in the status. Interrupt Enable for CGCE When set, generates interrupt when the Constant Gate Control Error occurs and is indicated in the status. When reset this event does not generate an interrupt 0 - Interrupt for CGCE is disabled 1 - Interrupt for CGCE is enabled
3 IEHS	Interrupt Enable for HLBS When set, generates interrupt when the Head-of-Line Blocking due to Scheduling issue and is indicated in the status. Interrupt Enable for HLBS When set, generates interrupt when the Head-of-Line Blocking due to Scheduling issue and is indicated in the status. When reset this event does not generate an interrupt. 0 - Interrupt for HLBS is disabled 1 - Interrupt for HLBS is enabled
2	Interrupt Enable for HLBF When set, generates interrupt when the Head-of-Line Blocking due to Frame Size error occurs and is indicated in the status.

Table continues on the next page...

Field	Description
IEHF	Interrupt Enable for HLBF When set, generates interrupt when the Head-of-Line Blocking due to Frame Size error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0 - Interrupt for HLBF is disabled 1 - Interrupt for HLBF is enabled
1 IEBE	Interrupt Enable for BTR Error When set, generates interrupt when the BTR Error occurs and is indicated in the status. Interrupt Enable for BTR Error When set, generates interrupt when the BTR Error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0 - Interrupt for BTR Error is disabled 1 - Interrupt for BTR Error is enabled
0 IECC	Interrupt Enable for Switch List When set, generates interrupt when the configuration change is successful and the hardware has switched to the new list. Interrupt Enable for Switch List When set, generates interrupt when the configuration change is successful and the hardware has switched to the new list. When reset this event does not generate an interrupt. 0 - Interrupt for Switch List is disabled 1 - Interrupt for Switch List is enabled



11.7.6.1.383 EST GCL Control (MTL_EST_GCL_CONTROL)

This register provides the control information for reading/writing to the Gate Control lists.

11.7.6.1.383.1 Offset

Register	Offset
MTL_EST_GCL_CONTROL	C80h

11.7.6.1.383.2 Diagram

11.7.6.1.383.3 Fields

Field	Description

23-22 ESTEIEC	ECC Inject Error Control for EST Memory When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. ECC Inject Error Control for EST Memory When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. This filed will be valid only if DWC_EQOS_ASP_ECC feature is selected during the configuration, else it will be reserved. 00 - Insert 1 bit error 01 - Insert 2 bit errors 10 - Insert 3 bit errors 11 - Insert 1 bit error in address field
21 ESTEIEE	EST ECC Inject Error Enable When set along with EEST bit of MTL_EST_CONTROL register, enables the ECC error injection feature. EST ECC Inject Error Enable When set along with EEST bit of MTL_EST_CONTROL register, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0 - EST ECC Inject Error is disabled 1 - EST ECC Inject Error is enabled
20 ERR0	When set indicates the last write operation was aborted as software writes to GCL and GCL registers is prohibited when SSWL bit of MTL_EST_CONTROL Register is set. When set indicates the last write operation was aborted as software writes to GCL and GCL registers is prohibited when SSWL bit of MTL_EST_CONTROL Register is set.

Table continues on the next page...

Field	Description
	Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - ERR0 is disabled 1 - ERR1 is enabled
19-17 —	Reserved
16-8 ADDR	Gate Control List Address: (GCLA when GCRR is "0"). Gate Control List Address: (GCLA when GCRR is "0"). Provides the address (row number) of the Gate Control List at which the R/W operation has to be performed. By default the Gate Control List pointed by SWOL of MTL_EST_STATUS is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. The width of this field is dependent on DWC_EQOS_EST_DEP; unused bits should be treated as read only. Gate Control list Related Registers Address: (GCRA when GCRR is "1"). By default the GCL related register set pointed by SWOL of MTL_EST_STATUS is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Lower 3 bits are only used in this mode, higher order bits are treated as dont cares. - 000: BTR Low (31:0) - 001: BTR High (63:31) - 010: CTR Low (31:0) - 011: CTR High (39:32) - 100: TER (31:0) - 101: LLR (n:0) (where n is (log{DWC_EQOS_EST_DEP} / log2)) - Others: Reserved
7-6 —	Reserved
5 DBGB	Debug Mode Bank Select When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). Debug Mode Bank Select When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). When set to "1" indicates R/W in debug mode should be directed to Bank 1 (GCL1 and corresponding Time related registers). This value is used when DBGM is set and overrides by value of SWOL which is normally used. 0 - R/W in debug mode should be directed to Bank 0 1 - R/W in debug mode should be directed to Bank 1
4 DBGM	Debug Mode When set to "1" indicates R/W in debug mode where the memory bank (for GCL and Time related registers) is explicitly provided by DBGB value, when set to "0" SWOL bit is used to determine which bank to use. 0 - Debug Mode is disabled 1 - Debug Mode is enabled
3 —	Reserved
2 GCRR	Gate Control Related Registers When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. Gate Control Related Registers

Table continues on the next page...

Field	Description
	When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. When "0" indicates R/W should be directed to GCL from the address provided by GCLA. 0 - Gate Control Related Registers are disabled 1 - Gate Control Related Registers are enabled
1 R1W0	Read '1', Write '0': When set to '1': Read Operation When set to '0': Write Operation. 0 - Write Operation 1 - Read Operation
0 SRWO	Start Read/Write Op When set indicates a Read/Write Op has started and is in progress. Start Read/Write Op When set indicates a Read/Write Op has started and is in progress. When reset by hardware indicates the R/W Op has completed or an error has occurred (when bit 20 is set) Reads: Data can be read from MTL_EST_GCL_DATA register after this bit is reset Writes: MTL_EST_GCL_DATA should be programmed with write data before setting SRWO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Start Read/Write Op disabled 1 - Start Read/Write Op enabled

11.7.6.1.384 EST GCL Data (MTL_EST_GCL_DATA)

This register holds the read data or write data in case of reads and writes respectively.

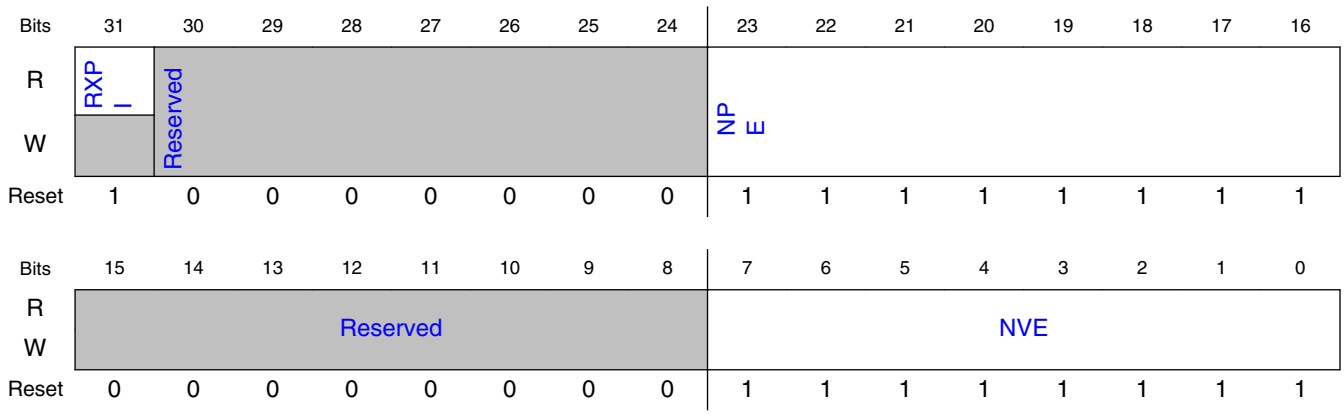
11.7.6.1.386.3 Fields

Field	Description
31-16 RADV	Release Advance The maximum time in nanoseconds that can elapse between issuing a RELEASE to the MAC and the MAC being ready to resume transmission of preemptable frames, in the absence of there being any express frames available for transmission.
15-0 HADV	Hold Advance The maximum time in nanoseconds that can elapse between issuing a HOLD to the MAC and the MAC ceasing to transmit any preemptable frame that is in the process of transmission or any preemptable frames that are queued for transmission.



11.7.6.1.387 RXP Control Status (MTL_RXP_CONTROL_STATUS)

The RXP Control Status register establishes the operating mode of Rx Parser and provides some status.

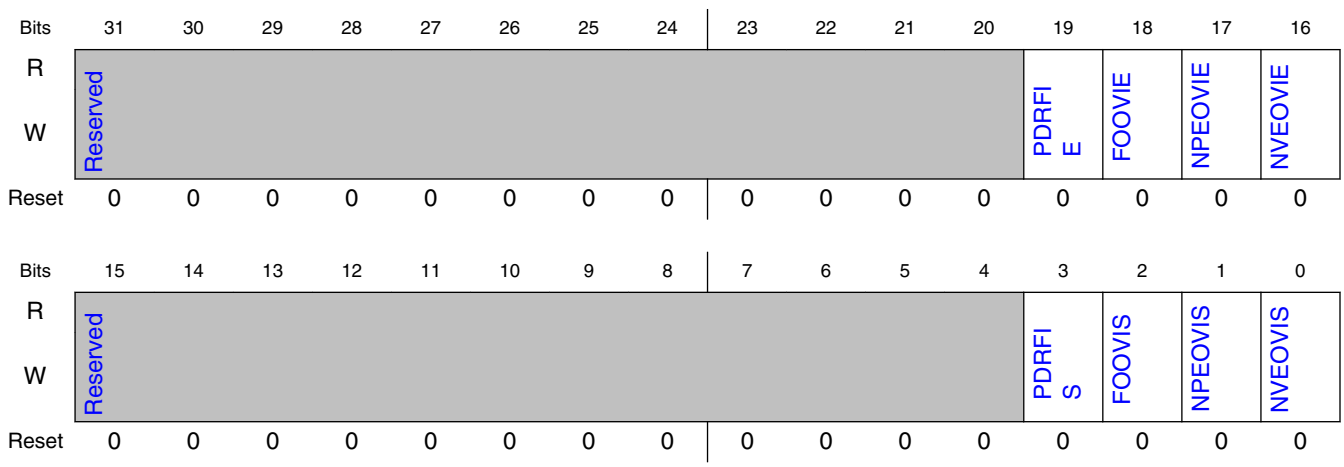
11.7.6.1.387.1 Offset

Register	Offset
MTL_RXP_CONTROL_STATUS	CA0h

11.7.6.1.387.2 Diagram

11.7.6.1.387.3 Fields

Field	Description
31 RXPI	RX Parser in Idle state This status bit is set to 1 when the Rx parser is in Idle State and waiting for a new packet for processing. RX Parser in Idle state This status bit is set to 1 when the Rx parser is in Idle State and waiting for a new packet for processing. This bit is used as a handshake with software when parser gets disables. After disabling, when bit is set then software can update the Rx parser instruction table. 0 - RX Parser not in Idle state 1 - RX Parser in Idle state
30-24 —	Reserved
23-16 NPE	Number of parsable entries in the Instruction table This control indicates the number of parsable entries in the Instruction Memory. Number of parsable entries in the Instruction table This control indicates the number of parsable entries in the Instruction Memory. This is used in Rx parser logic to detect programming Error. In case number of parsed entries for a packet is more than this entry then NPEOVIS bit in the MTL_RXP_INTERRUPT_CONTROL_STATUS register is set.
15-8 —	Reserved
7-0 NVE	Number of valid entries in the Instruction table This control indicates the number of valid entries in the Instruction Memory. Number of valid entries in the Instruction table This control indicates the number of valid entries in the Instruction Memory. This is used in Rx parser logic to detect any programming Error. In case while parsing Table address (memory address) found to be more than this entry then NVEOVIS bit in the MTL_RXP_INTERRUPT_CONTROL_STATUS register is set. Note: The minimum value of this should be 2.



11.7.6.1.388 RXP Interrupt Control Status (MTL_RXP_INTERRUPT_CONTROL_STATUS)

The RXP Interrupt Control Status register provides enable control for the interrupts and provides interrupt status.

11.7.6.1.388.1 Offset

Register	Offset
MTL_RXP_INTERRUPT_CONTROL_STATUS	CA4h

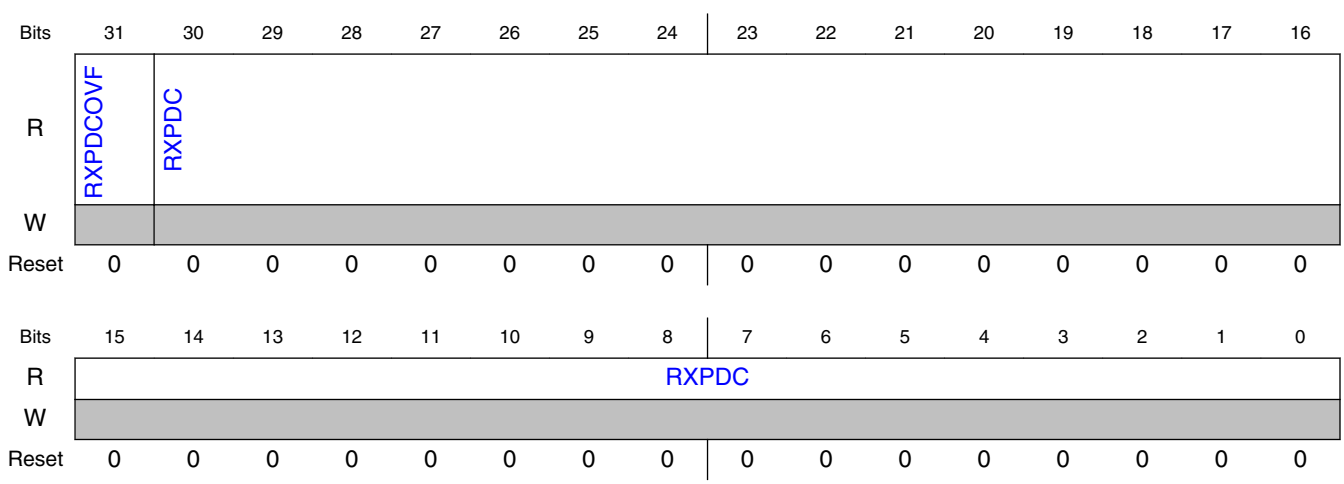
When this bit is reset, the PDRFIS interrupt is disabled. 0 - Packet Drop due to RF Interrupt is disabled 1 - Packet Drop due to RF Interrupt is enabled
18	Frame Offset Overflow Interrupt Enable When this bit is set, the FOOVIS interrupt is enabled.

Table continues on the next page...

Field	Description
FOOVIE	Frame Offset Overflow Interrupt Enable When this bit is set, the FOOVIS interrupt is enabled. When this bit is reset, the FOOVIS interrupt is disabled. 0 - Frame Offset Overflow Interrupt is disabled 1 - Frame Offset Overflow Interrupt is enabled
17 NPEOVIE	Number of Parsable Entries Overflow Interrupt Enable When this bit is set, the NPEOVIS interrupt is enabled. Number of Parsable Entries Overflow Interrupt Enable When this bit is set, the NPEOVIS interrupt is enabled. When this bit is reset, the NPEOVIS interrupt is disabled. 0 - Number of Parsable Entries Overflow Interrupt is disabled 1 - Number of Parsable Entries Overflow Interrupt is enabled
16 NVEOVIE	Number of Valid Entries Overflow Interrupt Enable When this bit is set, the NVEOVIS interrupt is enabled. Number of Valid Entries Overflow Interrupt Enable When this bit is set, the NVEOVIS interrupt is enabled. When this bit is reset, the NVEOVIS interrupt is disabled. 0 - Number of Valid Entries Overflow Interrupt is disabled 1 - Number of Valid Entries Overflow Interrupt is enabled
15-4 —	Reserved
3 PDRFIS	Packet Dropped due to RF Interrupt Status If the Rx Parser result says to drop the packet by setting RF=1 in the instruction memory, then this bit is set to 1. Packet Dropped due to RF Interrupt Status If the Rx Parser result says to drop the packet by setting RF=1 in the instruction memory, then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Packet Dropped due to RF Interrupt Status not detected 1 - Packet Dropped due to RF Interrupt Status detected
2 FOOVIS	Frame Offset Overflow Interrupt Status While parsing if the Instruction table entry's 'Frame Offset' found to be more than EOF offset, then then this bit is set. Frame Offset Overflow Interrupt Status While parsing if the Instruction table entry's 'Frame Offset' found to be more than EOF offset, then then this bit is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Frame Offset Overflow Interrupt Status not detected 1 - Frame Offset Overflow Interrupt Status detected
1 NPEOVIS	Number of Parsable Entries Overflow Interrupt Status While parsing a packet if the number of parsed entries found to be more than NPE[] (Number of Parseable Entries in MTL_RXP_CONTROL register),then this bit is set to 1. Number of Parsable Entries Overflow Interrupt Status

Table continues on the next page...

Field	Description
	While parsing a packet if the number of parsed entries found to be more than NPE[] (Number of Parseable Entries in MTL_RXP_CONTROL register),then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Number of Parsable Entries Overflow Interrupt Status not detected 1 - Number of Parsable Entries Overflow Interrupt Status detected
0 NVEOVIS	Number of Valid Entries Overflow Interrupt Status While parsing if the Instruction address found to be more than NVE (Number of Valid Entries in MTL_RXP_CONTROL register), then this bit is set to 1. Number of Valid Entries Overflow Interrupt Status While parsing if the Instruction address found to be more than NVE (Number of Valid Entries in MTL_RXP_CONTROL register), then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Number of Valid Entries Overflow Interrupt Status not detected 1 - Number of Valid Entries Overflow Interrupt Status detected



11.7.6.1.389 RXP Drop Count (MTL_RXP_DROP_CNT)

The MTL_RXP_DROP_CNT register provides the drop count of Rx Parser initiated drops.

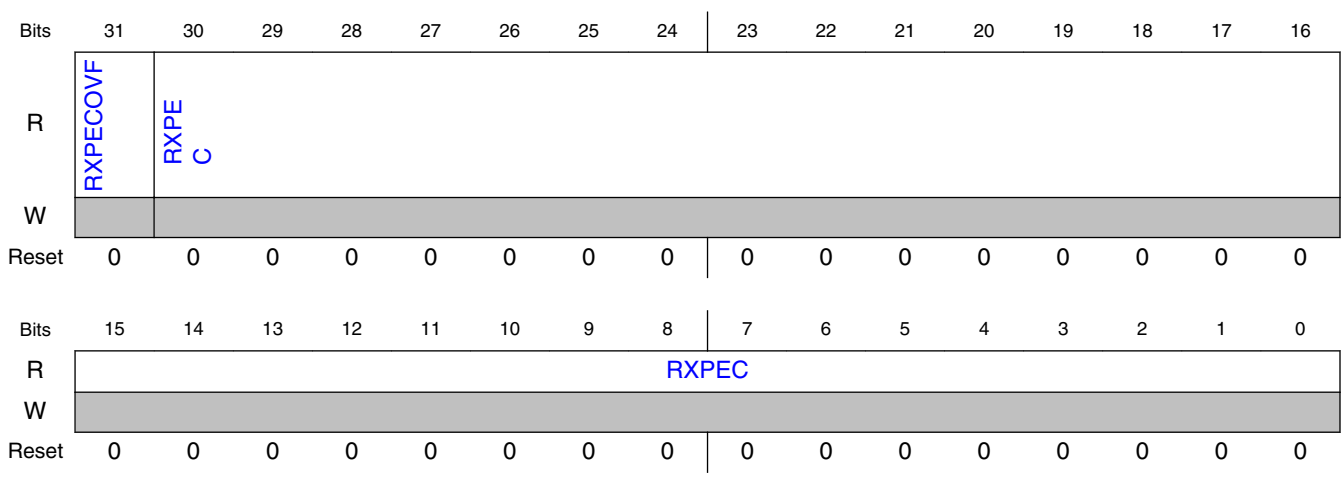
11.7.6.1.389.1 Offset

Register	Offset
MTL_RXP_DROP_CNT	CA8h

11.7.6.1.389.2 Diagram

11.7.6.1.389.3 Fields

Field	Description
31 RXPDCOVF	Rx Parser Drop Counter Overflow Bit When set, this bit indicates that the MTL_RXP_DROP_CNT (RXPDC) Counter field crossed the maximum limit. Rx Parser Drop Counter Overflow Bit When set, this bit indicates that the MTL_RXP_DROP_CNT (RXPDC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Rx Parser Drop count overflow not occurred 1 - Rx Parser Drop count overflow occurred
30-0 RXPDC	Rx Parser Drop count This 31-bit counter is implemented whenever a Rx Parser Drops a packet due to RF =1. Rx Parser Drop count This 31-bit counter is implemented whenever a Rx Parser Drops a packet due to RF =1. The counter is cleared when the register is read.



11.7.6.1.390 RXP Error Count (MTL_RXP_ERROR_CNT)

The RXP_ERROR_CNT register provides the Rx Parser related error occurrence count.

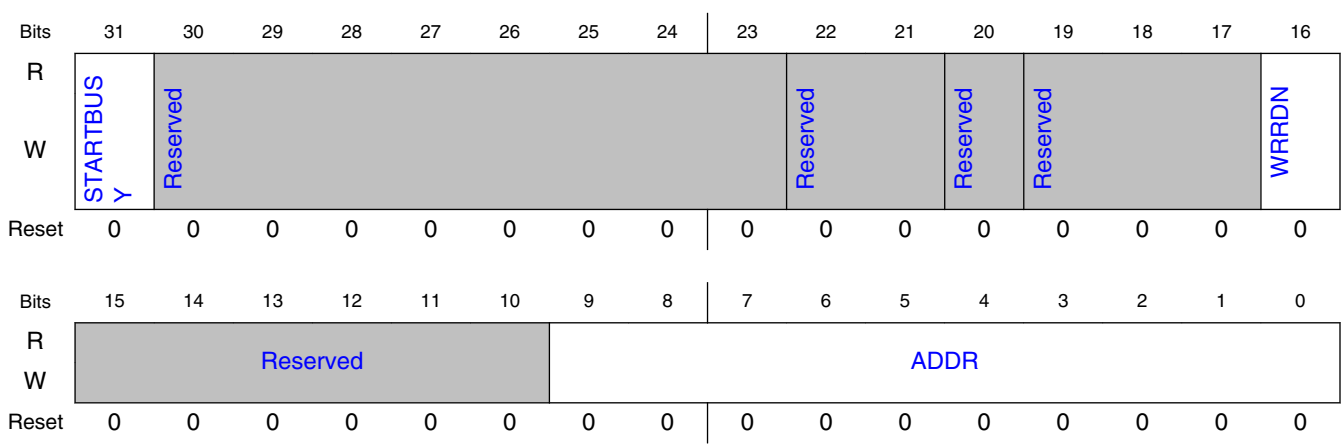
11.7.6.1.390.1 Offset

Register	Offset
MTL_RXP_ERROR_CNT	CACh

11.7.6.1.390.2 Diagram

11.7.6.1.390.3 Fields

Field	Description
31 RXPECOVF	Rx Parser Error Counter Overflow Bit When set, this bit indicates that the MTL_RXP_ERROR_CNT (RXPEC) Counter field crossed the maximum limit. Rx Parser Error Counter Overflow Bit When set, this bit indicates that the MTL_RXP_ERROR_CNT (RXPEC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Rx Parser Error count overflow not occurred 1 - Rx Parser Error count overflow occurred
30-0 RXPEC	Rx Parser Error count This 31-bit counter is implemented whenever a Rx Parser encounters following Error scenarios - Entry address >= NVE[] - Number Parsed Entries >= NPE[] - Entry address > EOF data entry address The counter is cleared when the register is read.



11.7.6.1.391 RXP Indirect Access Control and Status (MTL_RXP_INDIRECT_ACC_CONTROL_STATUS)

The RXP_INDIRECT_ACC_CONTROL_STATUS register provides the Indirect Access control and status for Rx Parser memory.

11.7.6.1.391.1 Offset

Register	Offset
MTL_RXP_INDIRECT_ACC_CONTROL_STATUS	CB0h

11.7.6.1.391.2 Diagram

11.7.6.1.391.3 Fields

Field	Description
31 STARTBUSY	FRP Instruction Table Access Busy When this bit is set to 1 by the software then it indicates to start the Read/Write operation from/to the Rx Parser Memory. FRP Instruction Table Access Busy When this bit is set to 1 by the software then it indicates to start the Read/Write operation from/to the Rx Parser Memory. Software should read this bit as 0 before issuing read or write request to access the Parser Memory Instructions. This bit when set to 1 indicates that hardware is busy until its gets cleared by hardware and software should not issue any read or write operation. 0 - hardware not busy 1 - hardware is busy (Read/Write operation from/to the Rx Parser Memory)
30-23 —	Reserved
22-21 —	Reserved
20 —	Reserved
19-17 —	Reserved
16 WRRDN	Read Write Control When this bit is set to 1 indicates the write operation to the Rx Parser Memory. Read Write Control When this bit is set to 1 indicates the write operation to the Rx Parser Memory. When this bit is set to 0 indicates the read operation to the Rx Parser Memory. 0 - Read operation to the Rx Parser Memory 1 - Write operation to the Rx Parser Memory
15-10 —	Reserved
9-0 ADDR	FRP Instruction Table Offset Address This field indicates the ADDR of the 32-bit entry in Rx parser instruction table. FRP Instruction Table Offset Address This field indicates the ADDR of the 32-bit entry in Rx parser instruction table. Each entry has 128-bit (4x32-bit words). The X depends on the configurable DWC_EQOS_FRP_ENTRIES If DWC_EQOS_FRP_ENTRIES == 256 , then X = 9 If DWC_EQOS_FRP_ENTRIES = 128 , then X = 8 IF DWC_EQOS_FRP_ENTRIES = 64, then X = 7 This is can be written by the software before issuing any Read/Write command. The hardware auto-increments this field after the read-write operation gets completed.

11.7.6.1.392 RXP Indirect Access Data (MTL_RXP_INDIRECT_ACC_DATA)

The RXP_INDIRECT_ACC_DATA registers holds the data associated to Indirect Access to Rx Parser memory.

11.7.6.1.392.1 Offset

Register	Offset
MTL_RXP_INDIRECT_ACC_DATA	CB4h

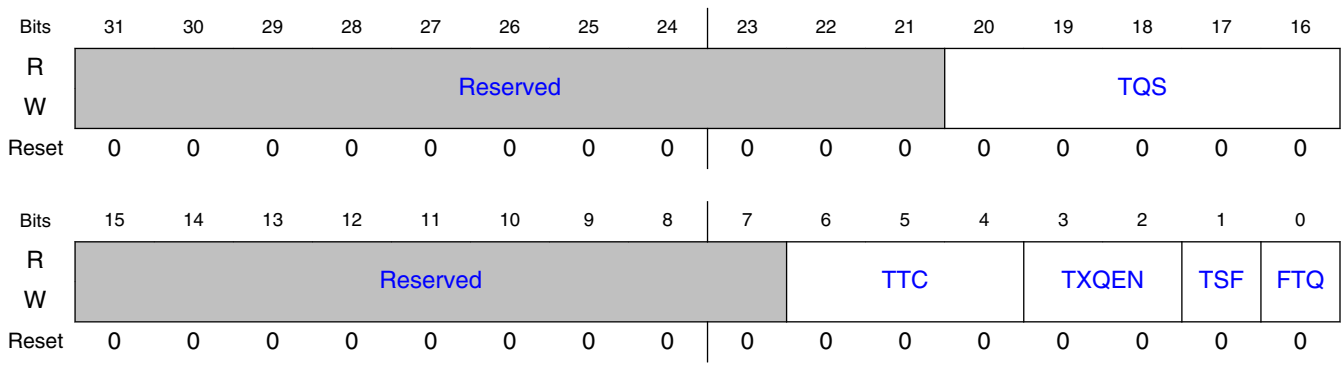
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.7.6.1.392.3 Fields

Field	Description
31-0 DATA	FRP Instruction Table Write/Read Data Software should write this register before issuing any write command. FRP Instruction Table Write/Read Data Software should write this register before issuing any write command. The hardware provides the read data from the Rx Parser Memory for read operation when STARTBUSY =0 after read command.



11.7.6.1.393 Queue 0 Transmit Operation Mode (MTL_TXQ0_OPERATION_MODE)

The Queue 0 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

11.7.6.1.393.1 Offset

Register	Offset
MTL_TXQ0_OPERATION_MODE	D00h

11.7.6.1.393.2 Diagram

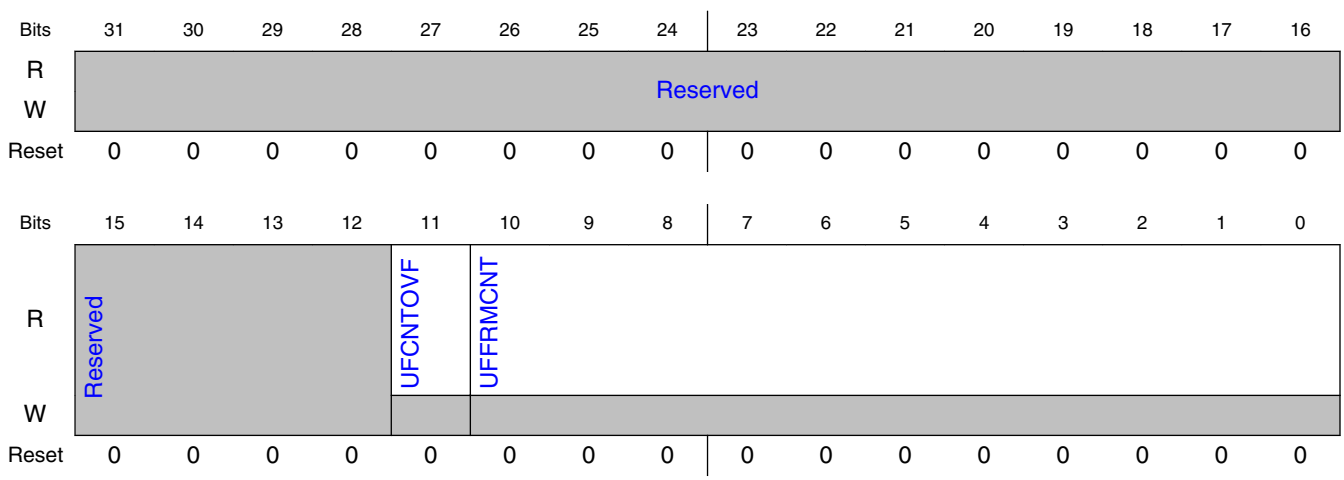
11.7.6.1.393.3 Fields

Field	Description
31-21 —	Reserved
20-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset.

Table continues on the next page...

Field	Description
	000 - 32 001 - 64 010 - 96 011 - 128 100 - 192 101 - 256 110 - 384 111 - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Reserved - 2'b10: Enabled - 2'b11: Reserved This field is Read Only in Single Queue configurations and Read Write in Multiple Queue configurations. Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00 - Not enabled 01 - Enable in AV mode (Reserved in non-AV) 10 - Enabled 11 - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ1_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Flush Transmit Queue is disabled

Field	Description
	1 - Flush Transmit Queue is enabled



11.7.6.1.394 Queue 0 Underflow Counter (MTL_TXQ0_UNDERFLOW)

The Queue 0 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

11.7.6.1.394.1 Offset

Field	Description
31-21 —	Reserved

Table continues on the next page...

Field	Description
20-0 ISCQW	Quantum or Weights When the DCB operation is enabled with DWRR algorithm for Queue 0 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. Quantum or Weights When the DCB operation is enabled with DWRR algorithm for Queue 0 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. When DCB operation is enabled with WFQ algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. The higher the programmed weights lesser the bandwidth allocated for the particular Transmit Queue. This is because the weights are used to compute the packet finish time (weights*packet_size). Lesser the finish time, higher the probability of the packet getting scheduled first and using more bandwidth. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero.

11.7.6.1.398 Queue 0 Interrupt Control Status (MTL_Q0_INTERRUPT_CONTROL_STATUS)

This register contains the interrupt enable and status bits for the queue 0 interrupts.

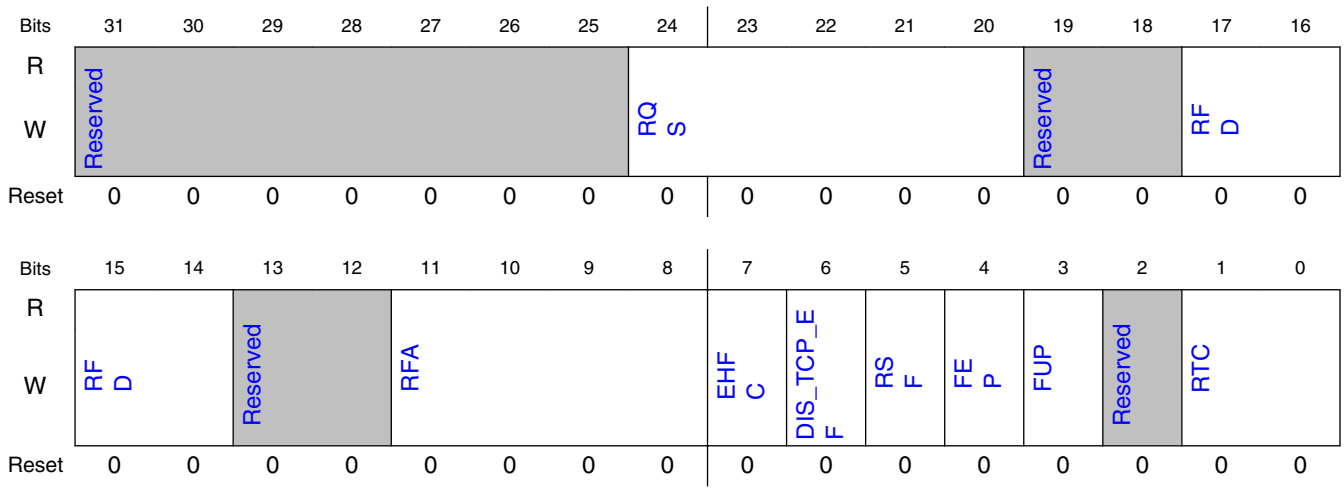
Field	Description
31-25 —	Reserved
24 RXOIE	Receive Queue Overflow Interrupt Enable When this bit is set, the Receive Queue Overflow interrupt is enabled. Receive Queue Overflow Interrupt Enable When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0 - Receive Queue Overflow Interrupt is disabled 1 - Receive Queue Overflow Interrupt is enabled
23-17 —	Reserved
16 RXOVFIS	Receive Queue Overflow Interrupt Status This bit indicates that the Receive Queue had an overflow while receiving the packet. Receive Queue Overflow Interrupt Status This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Queue Overflow Interrupt Status not detected 1 - Receive Queue Overflow Interrupt Status detected
15-10 —	Reserved
9 ABPSIE	Average Bits Per Slot Interrupt Enable When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. Average Bits Per Slot Interrupt Enable When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0 - Average Bits Per Slot Interrupt is disabled 1 - Average Bits Per Slot Interrupt is enabled
8 TXUIE	Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0 - Transmit Queue Underflow Interrupt Status is disabled 1 - Transmit Queue Underflow Interrupt Status is enabled
7-2 —	Reserved

Table continues on the next page...

Field	Description
1 ABPSIS	Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Average Bits Per Slot Interrupt Status not detected 1 - Average Bits Per Slot Interrupt Status detected
0 TXUNFIS	Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Queue Underflow Interrupt Status not detected 1 - Transmit Queue Underflow Interrupt Status detected

11.7.6.1.399 Queue 0 Receive Operation Mode (MTL_RXQ0_OPERATION_MODE)



The Queue 0 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

11.7.6.1.399.1 Offset

Register	Offset
MTL_RXQ0_OPERATION_MODE	D30h

11.7.6.1.399.2 Diagram

11.7.6.1.399.3 Fields

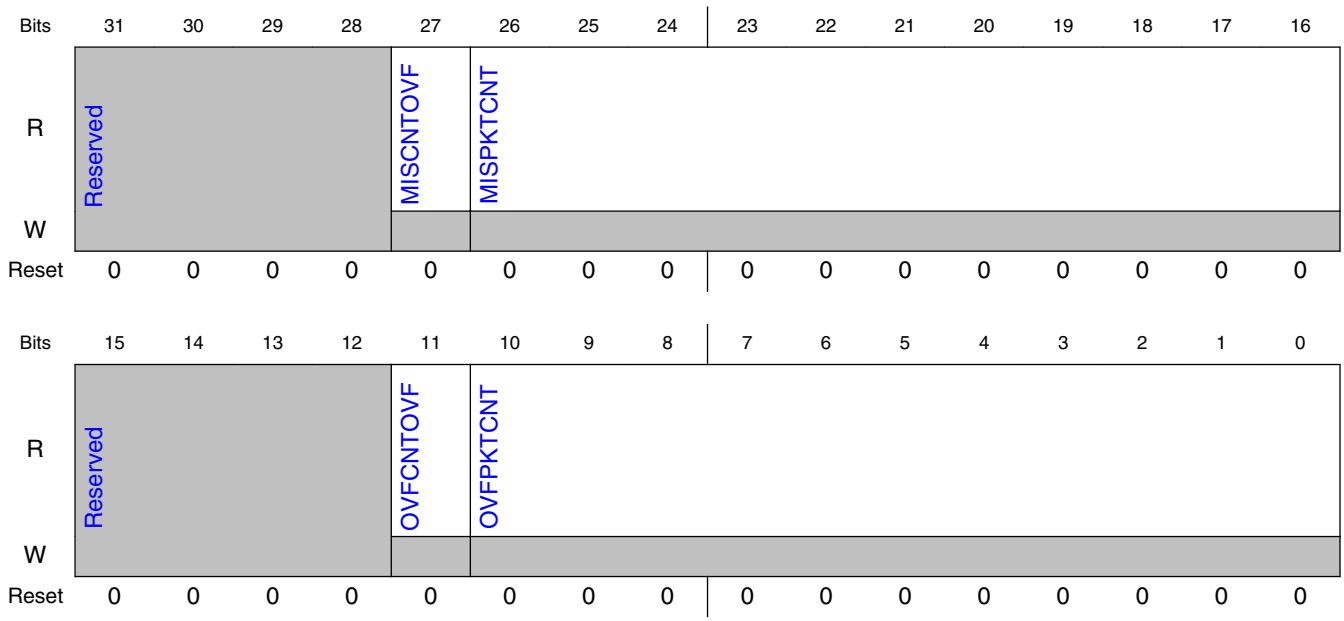
Field	Description
31-25 —	Reserved
24-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1. Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB

Table continues on the next page...

Field	Description
	- ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow).

Table continues on the next page...

Field	Description
	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128



11.7.6.1.400 Queue 0 Missed Packet and Overflow Counter (MTL_RXQ0_MISSED_PACKET_OVERFLOW_CNT)

The Queue 0 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

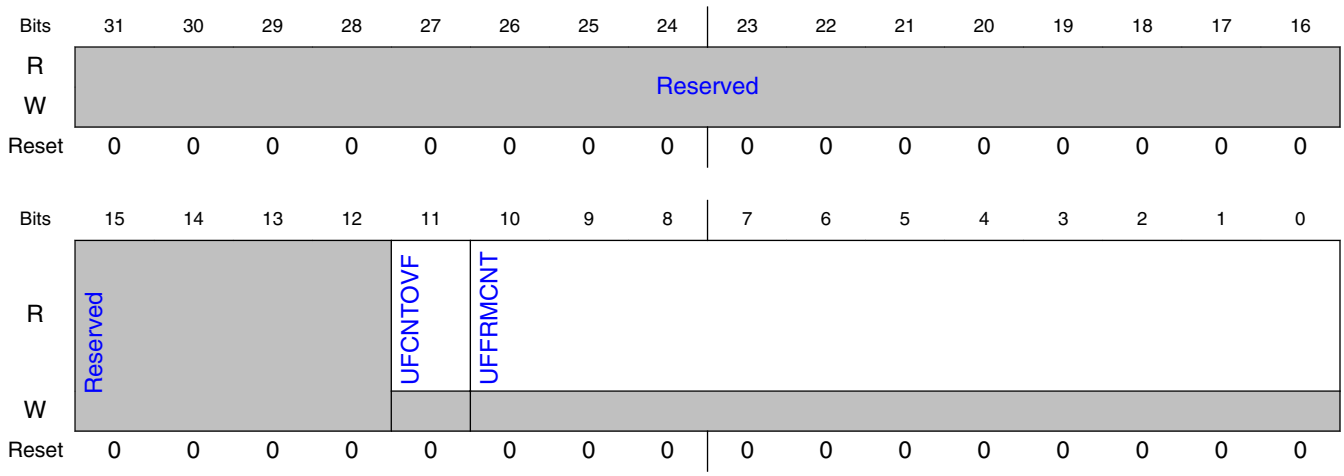
Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00 - Not enabled 01 - Enable in AV mode (Reserved in non-AV) 10 - Enabled

Table continues on the next page...

Field	Description
	11 - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ1_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Flush Transmit Queue is disabled 1 - Flush Transmit Queue is enabled



11.7.6.1.404 Queue 1 Underflow Counter (MTL_TXQ1_UNDERFLOW)

The Queue 1 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

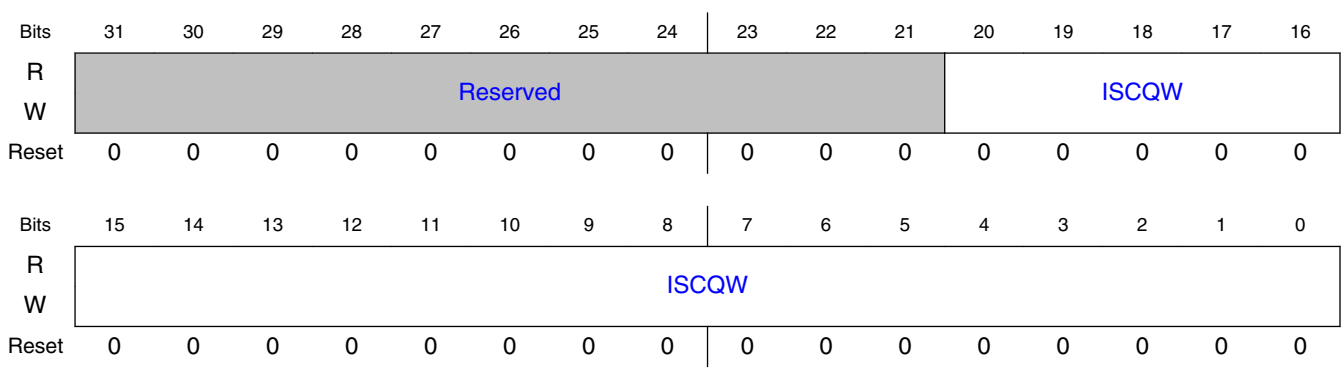
11.7.6.1.407.3 Fields

Field	Description
31-24 —	Reserved
23-0 ABS	Average Bits per Slot This field contains the average transmitted bits per slot. Average Bits per Slot This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TXQ[N]_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.



11.7.6.1.408 Queue 1 idleSlopeCredit, Quantum or Weights (MTL_TXQ1_QUANTUM_WEIGHT)

The Queue 1 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 1.

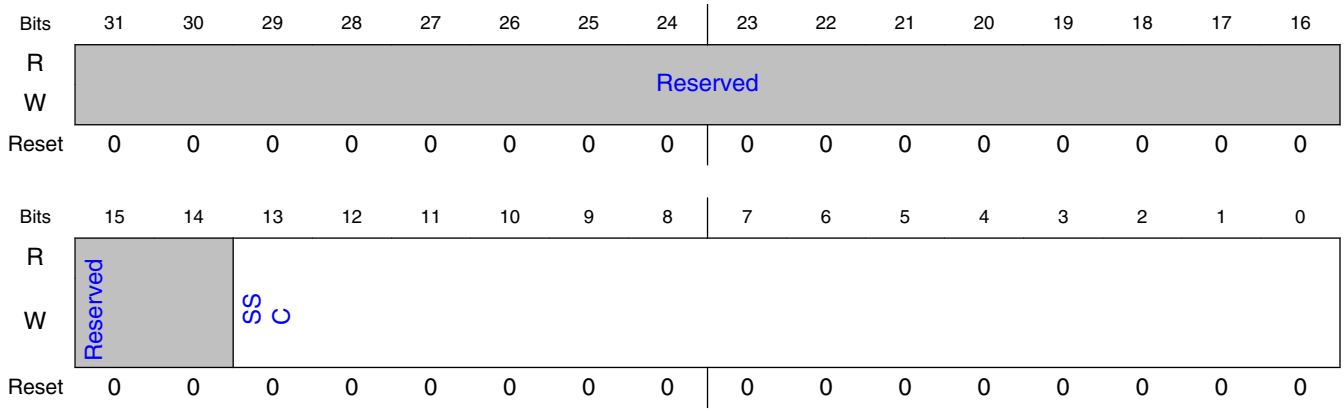
11.7.6.1.408.1 Offset

Register	Offset
MTL_TXQ1_QUANTUM_WEIGHT	D58h

11.7.6.1.408.2 Diagram

11.7.6.1.408.3 Fields

Field	Description
31-21 —	Reserved
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_OPERATION_MODE register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.



11.7.6.1.409 Queue 1 sendSlopeCredit (MTL_TXQ1_SENDSLOPECREDIT)

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Field	Description
31-25 —	Reserved
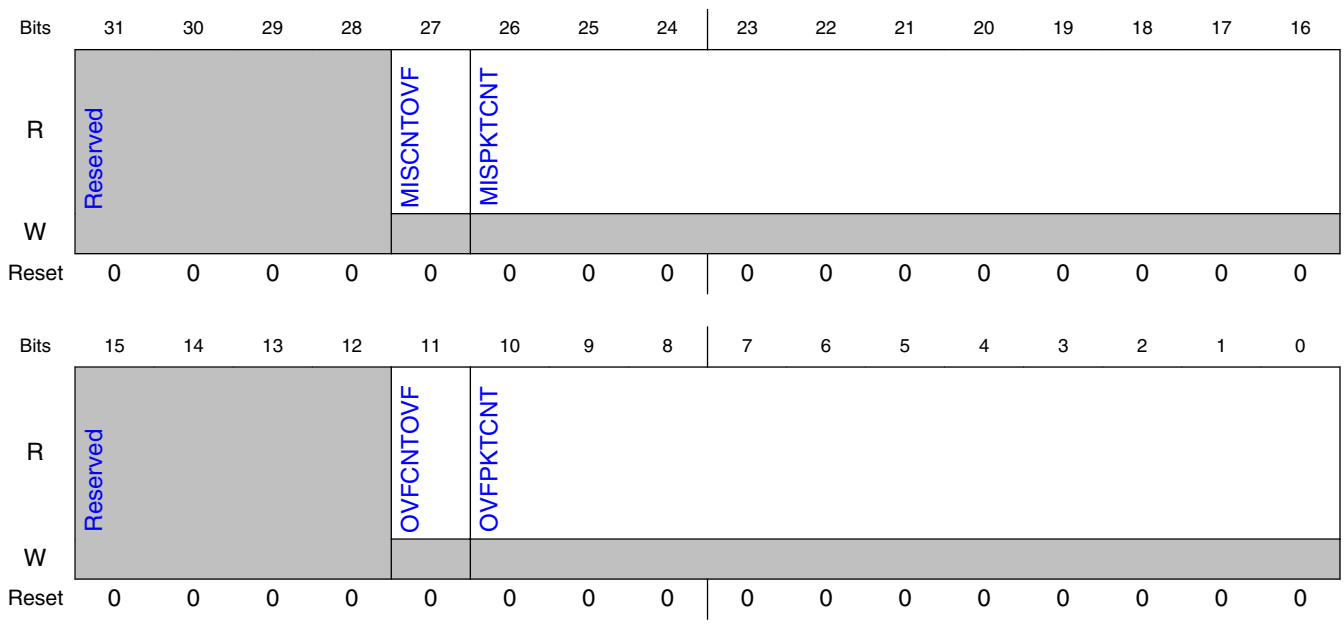
24-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved

Table continues on the next page...

Field	Description
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1. Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled

Table continues on the next page...

Field	Description
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128



11.7.6.1.414 Queue 1 Missed Packet and Overflow Counter (MTL_RXQ1_MISSED_PACKET_OVERFLOW_CNT)

The Queue 1 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

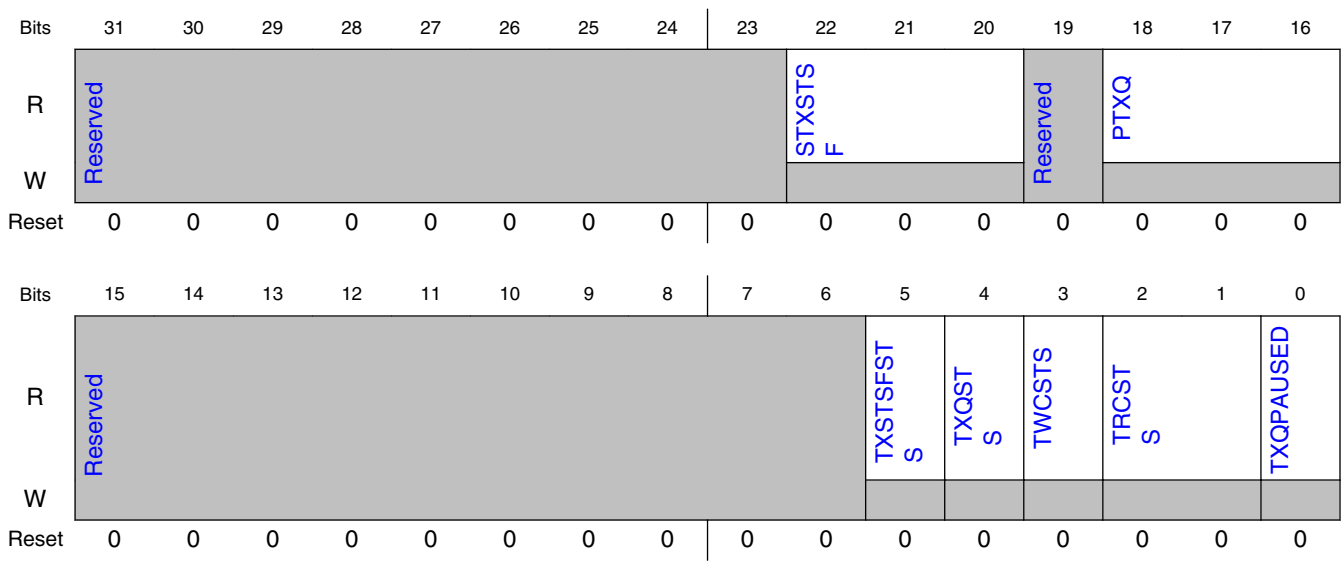
Overflow Bit for Underflow Packet Counter This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Overflow not detected for Underflow Packet Counter 1 - Overflow detected for Underflow Packet Counter
10-0 UFFRMCNT	Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.



11.7.6.1.419 Queue 2 Transmit Debug (MTL_TXQ2_DEBUG)

The Queue 2 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

11.7.6.1.419.1 Offset

Register	Offset
MTL_TXQ2_DEBUG	D88h

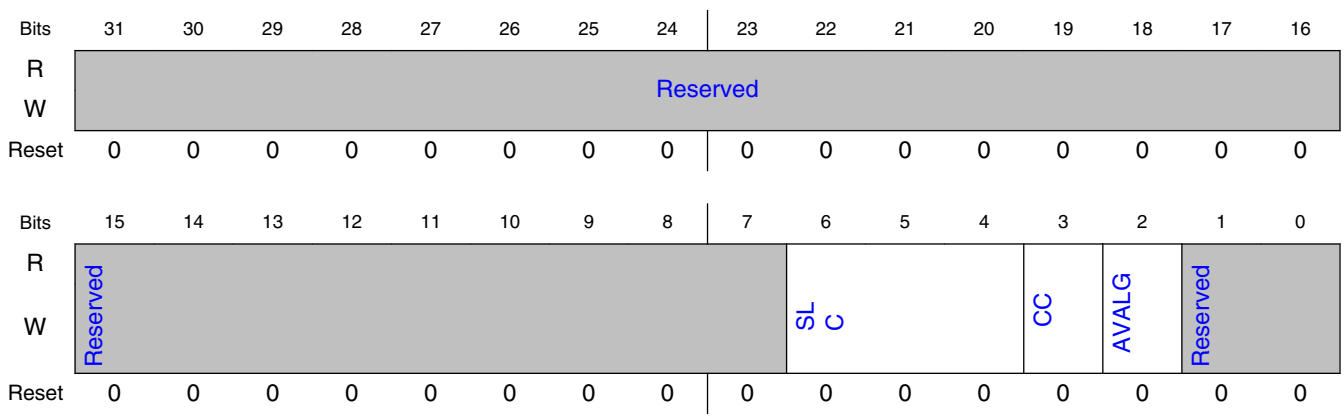
11.7.6.1.419.2 Diagram

11.7.6.1.419.3 Fields

Field	Description
31-23 —	Reserved
22-20 STXSTSF	Number of Status Words in Tx Status FIFO of Queue This field indicates the current number of status in the Tx Status FIFO of this queue. Number of Status Words in Tx Status FIFO of Queue This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_OPERATION_MODE register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.

Table continues on the next page...

Field	Description
19 —	Reserved
18-16 PTXQ	Number of Packets in the Transmit Queue This field indicates the current number of packets in the Tx Queue. Number of Packets in the Transmit Queue This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_OPERATION_MODE register is set to 1, this field does not reflect the number of packets in the Transmit queue.
15-6 —	Reserved
5 TXSTSFSTS	MTL Tx Status FIFO Full Status When high, this bit indicates that the MTL Tx Status FIFO is full. MTL Tx Status FIFO Full Status When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0 - MTL Tx Status FIFO Full status is not detected 1 - MTL Tx Status FIFO Full status is detected
4 TXQSTS	MTL Tx Queue Not Empty Status When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0 - MTL Tx Queue Not Empty status is not detected 1 - MTL Tx Queue Not Empty status is detected
3 TWCSTS	MTL Tx Queue Write Controller Status When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0 - MTL Tx Queue Write Controller status is not detected 1 - MTL Tx Queue Write Controller status is detected
2-1 TRCSTS	MTL Tx Queue Read Controller Status This field indicates the state of the Tx Queue Read Controller: 00 - Idle state 01 - Read state (transferring data to the MAC transmitter) 10 - Waiting for pending Tx Status from the MAC transmitter 11 - Flushing the Tx queue because of the Packet Abort request from the MAC
0 TXQPAUSED	Transmit Queue in Pause When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802. Transmit Queue in Pause When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0 - Transmit Queue in Pause status is not detected 1 - Transmit Queue in Pause status is detected



11.7.6.1.420 Queue 2 ETS Control (MTL_TXQ2_ETS_CONTROL)

The Queue 2 ETS Control register controls the enhanced transmission selection operation.

11.7.6.1.420.1 Offset

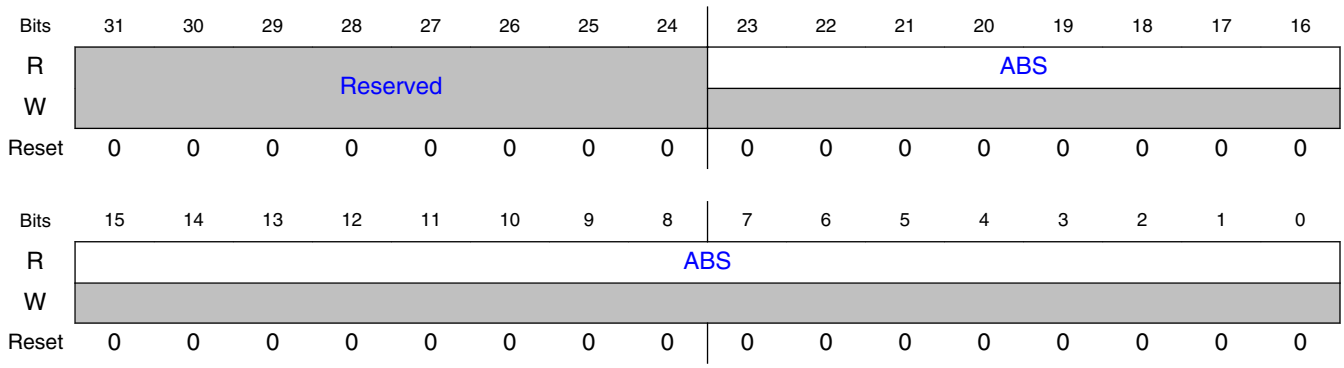
11.7.6.1.420.3 Fields

Field	Description
31-7 —	Reserved
6-4 SLC	Slot Count If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH[N]_SLOT_INTERVAL register) over which the average transmitted bits per slot, provided in the MTL_TXQ[N]_ETS_STATUS register, need to be computed for Queue. Slot Count If the credit-based shaper algorithm is enabled, the software can program the number of slots (of duration programmed in DMA_CH[N]_SLOT_INTERVAL register) over which the average transmitted bits per slot, provided in the MTL_TXQ[N]_ETS_STATUS register, need to be computed for Queue. The encoding is as follows: 000 - 1 slot 001 - 2 slots 010 - 4 slots 011 - 8 slots

Table continues on the next page...

Field	Description
	100 - 16 slots 101 - Reserved
3 CC	Credit Control When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. Credit Control When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting. When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated. 0 - Credit Control is disabled 1 - Credit Control is enabled
2 AVALG	AV Algorithm When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. AV Algorithm When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue: This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected. 0 - CBS Algorithm is disabled 1 - CBS Algorithm is enabled
1-0 —	Reserved



11.7.6.1.421 Queue 2 ETS Status (MTL_TXQ2_ETS_STATUS)

The Queue 2 ETS Status register provides the average traffic transmitted in Queue 2.

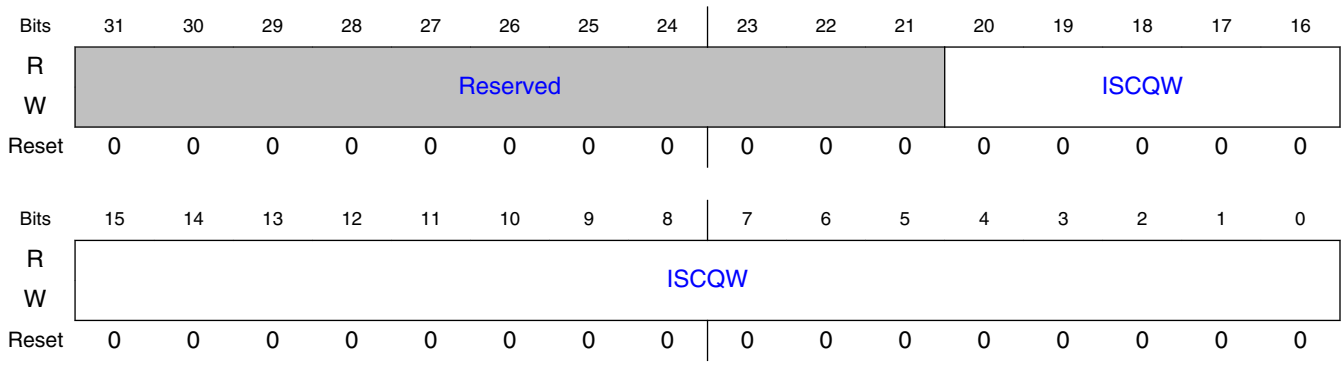
11.7.6.1.421.1 Offset

Register	Offset
MTL_TXQ2_ETS_STATUS	D94h

11.7.6.1.421.2 Diagram

11.7.6.1.421.3 Fields

Field	Description
31-24 —	Reserved
23-0 ABS	Average Bits per Slot This field contains the average transmitted bits per slot. Average Bits per Slot This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TXQ[n]_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.



11.7.6.1.422 Queue 2 idleSlopeCredit, Quantum or Weights (MTL_TXQ2_QUANTUM_WEIGHT)

The Queue 2 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 2.

11.7.6.1.422.1 Offset

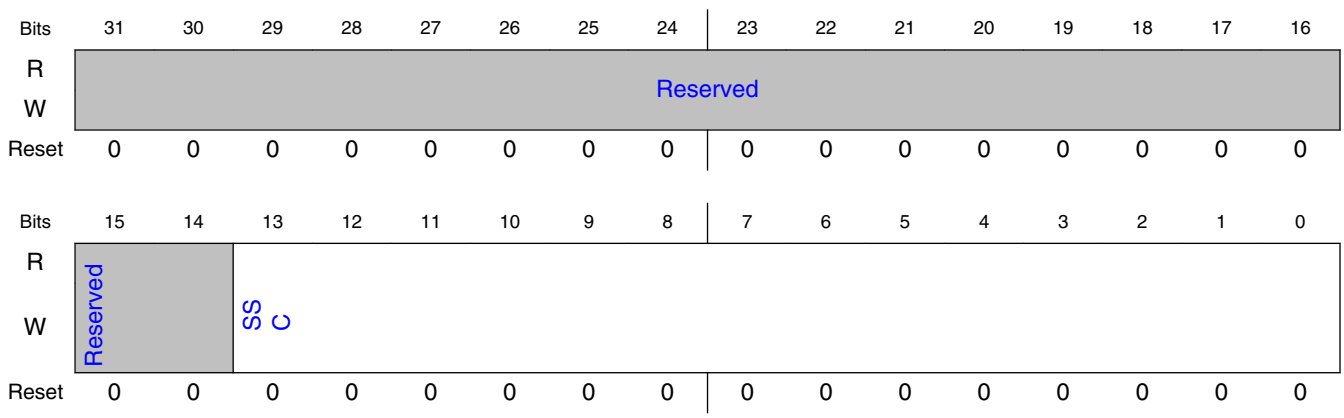
Register	Offset
MTL_TXQ2_QUANTUM_WEIGHT	D98h

11.7.6.1.422.2 Diagram

11.7.6.1.422.3 Fields

Field	Description
31-21 —	Reserved
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_OPERATION_MODE register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size))

Field	Description
	- Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.



11.7.6.1.423 Queue 2 sendSlopeCredit (MTL_TXQ2_SENDSLOPECREDIT)

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

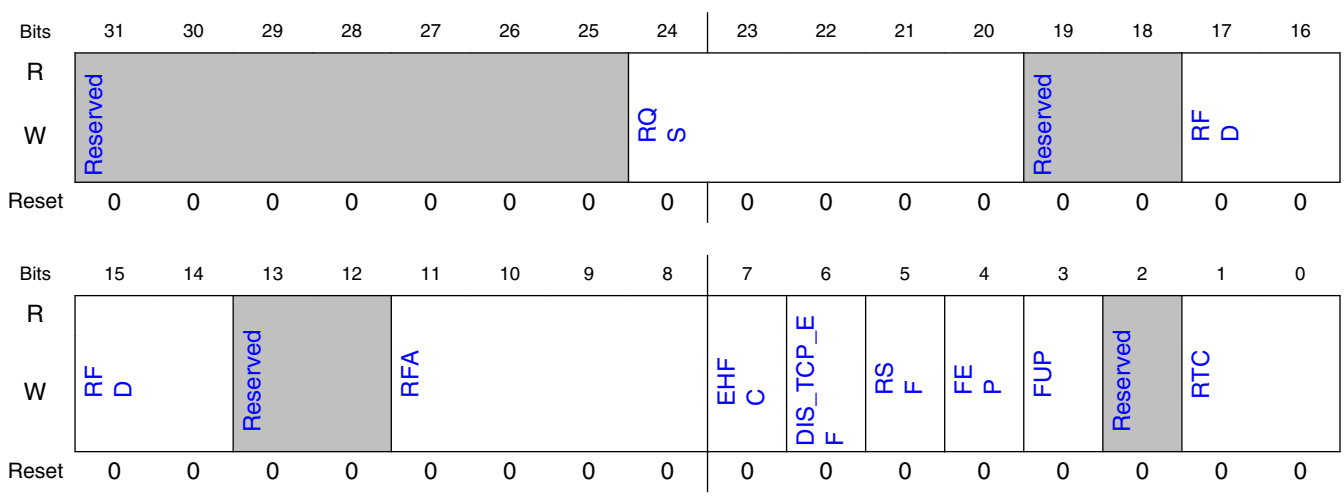
Table continues on the next page...

Field	Description
16 RXOVFIS	Receive Queue Overflow Interrupt Status This bit indicates that the Receive Queue had an overflow while receiving the packet. Receive Queue Overflow Interrupt Status This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Queue Overflow Interrupt Status not detected 1 - Receive Queue Overflow Interrupt Status detected
15-10 —	Reserved
9 ABPSIE	Average Bits Per Slot Interrupt Enable When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. Average Bits Per Slot Interrupt Enable When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0 - Average Bits Per Slot Interrupt is disabled 1 - Average Bits Per Slot Interrupt is enabled
8 TXUIE	Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0 - Transmit Queue Underflow Interrupt Status is disabled 1 - Transmit Queue Underflow Interrupt Status is enabled
7-2 —	Reserved
1 ABPSIS	Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Average Bits Per Slot Interrupt Status not detected 1 - Average Bits Per Slot Interrupt Status detected
0 TXUNFIS	Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

Field	Description
	0 - Transmit Queue Underflow Interrupt Status not detected 1 - Transmit Queue Underflow Interrupt Status detected

11.7.6.1.427 Queue 2 Receive Operation Mode (MTL_RXQ2_OPERATION_MODE)

The Queue 2 Receive Operation Mode register establishes the Receive queue operating modes and command.



The Queue 2 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

11.7.6.1.427.1 Offset

Register	Offset
MTL_RXQ2_OPERATION_MODE	DB0h

11.7.6.1.427.2 Diagram

11.7.6.1.427.3 Fields

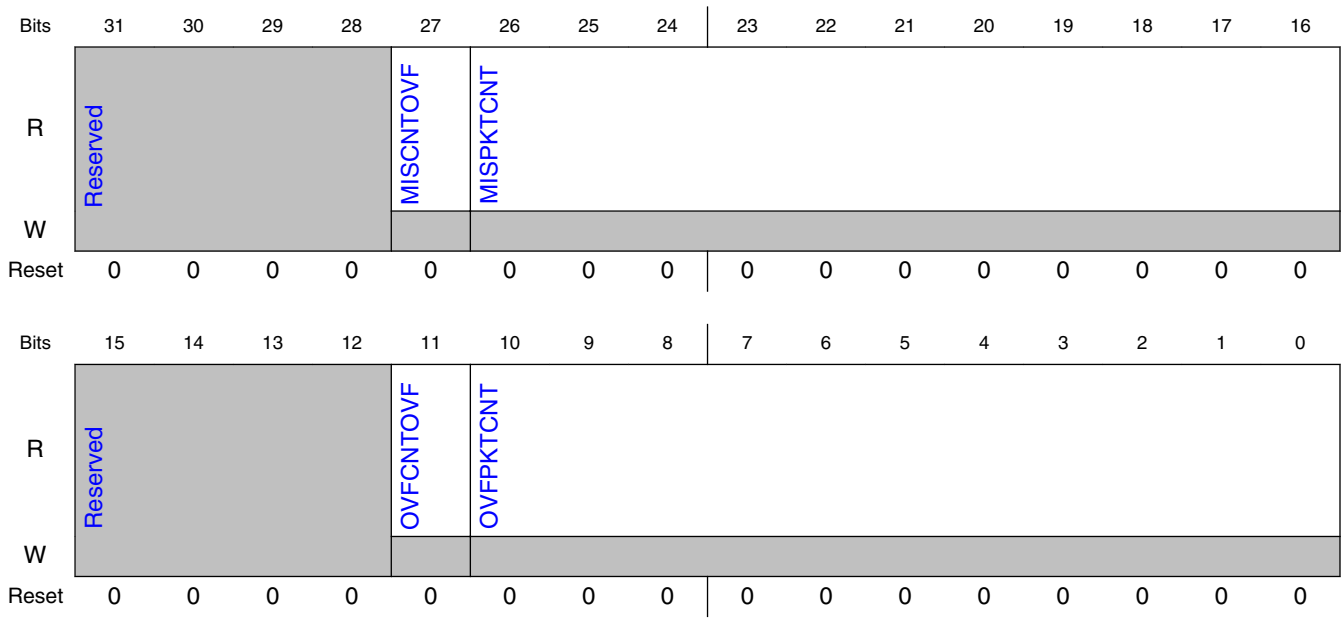
Field	Description
31-25 —	Reserved
24-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1. Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.

Table continues on the next page...

Field	Description
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled

Table continues on the next page...

Field	Description
	1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128



11.7.6.1.428 Queue 2 Missed Packet and Overflow Counter (MTL_RXQ2_MISSED_PACKET_OVERFLOW_CNT)

The Queue 2 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

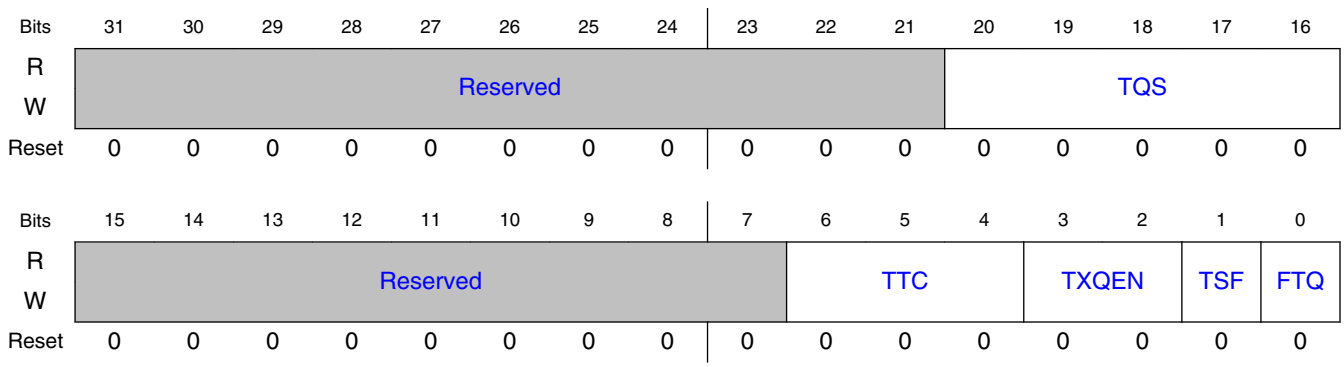
31-4 —	Reserved
3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the DWC_ether_qos drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the DWC_ether_qos drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0 - Receive Queue Packet Arbitration is disabled 1 - Receive Queue Packet Arbitration is enabled
2-0 RXQ_WEGT	Receive Queue Weight This field indicates the weight assigned to the Rx Queue 0. Receive Queue Weight This field indicates the weight assigned to the Rx Queue 0. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle.



11.7.6.1.431 Queue 3 Transmit Operation Mode (MTL_TXQ3_OPERATION_MODE)

The Queue 3 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

11.7.6.1.431.1 Offset

MTL_TXQ3_OPERATION_MODE	DC0h

11.7.6.1.431.2 Diagram

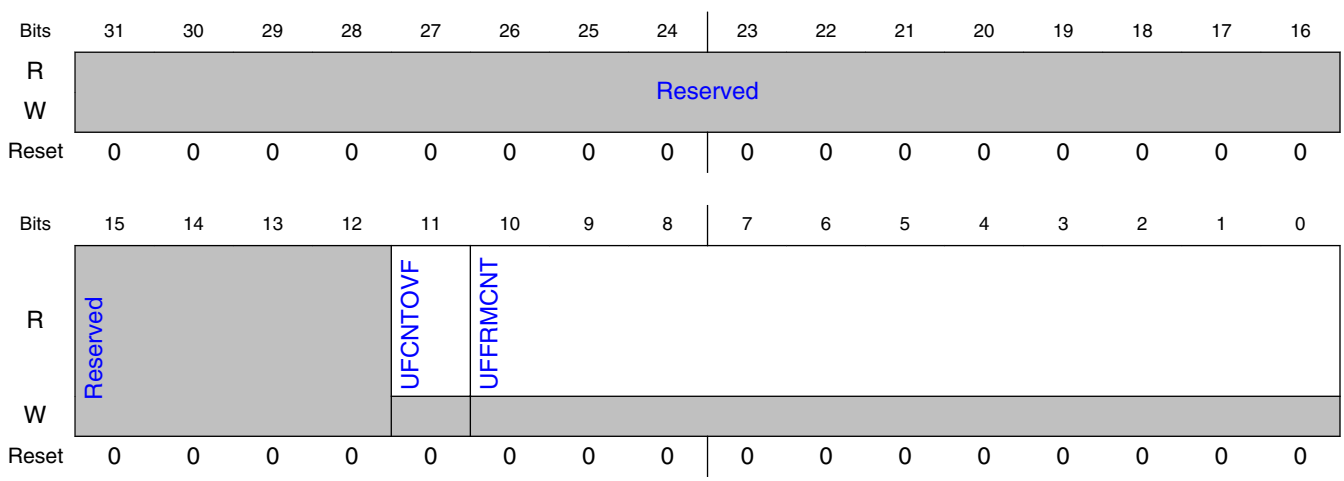
11.7.6.1.431.3 Fields

Field	Description
31-21 —	Reserved
20-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved

Table continues on the next page...

Field	Description
6-4 TTC	Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000 - 32 001 - 64 010 - 96 011 - 128 100 - 192 101 - 256 110 - 384 111 - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00 - Not enabled 01 - Enable in AV mode (Reserved in non-AV) 10 - Enabled 11 - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ1_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission.

Field	Description
	Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Flush Transmit Queue is disabled 1 - Flush Transmit Queue is enabled



11.7.6.1.432 Queue 3 Underflow Counter (MTL_TXQ3_UNDERFLOW)

The Queue 3 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

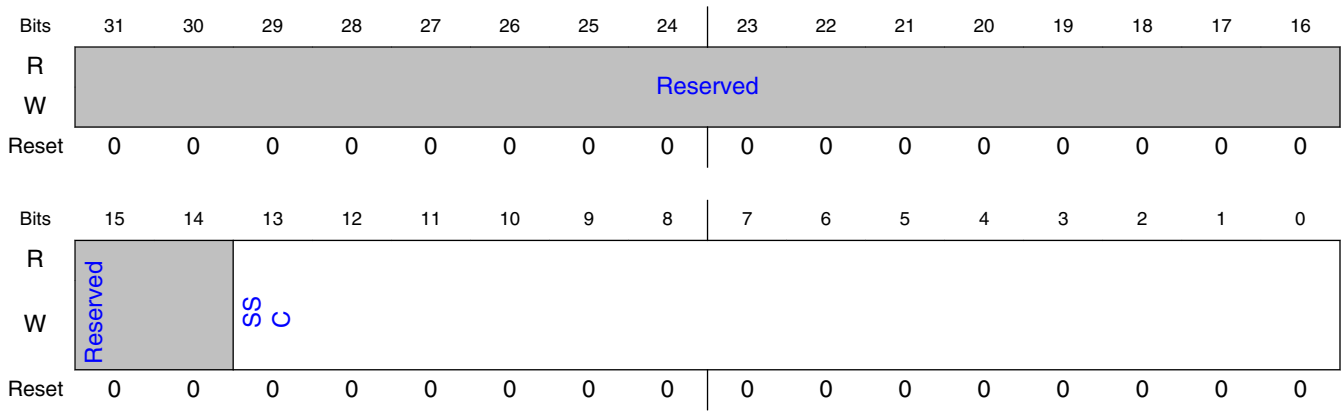
11.7.6.1.436.3 Fields

Field	Description
31-21	Reserved

Table continues on the next page...

Field	Description
—	
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is OPERATION_MODE register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.



11.7.6.1.437 Queue 3 sendSlopeCredit (MTL_TXQ3_SENDSLOPECREDIT)

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Field	Description
31-25 —	Reserved
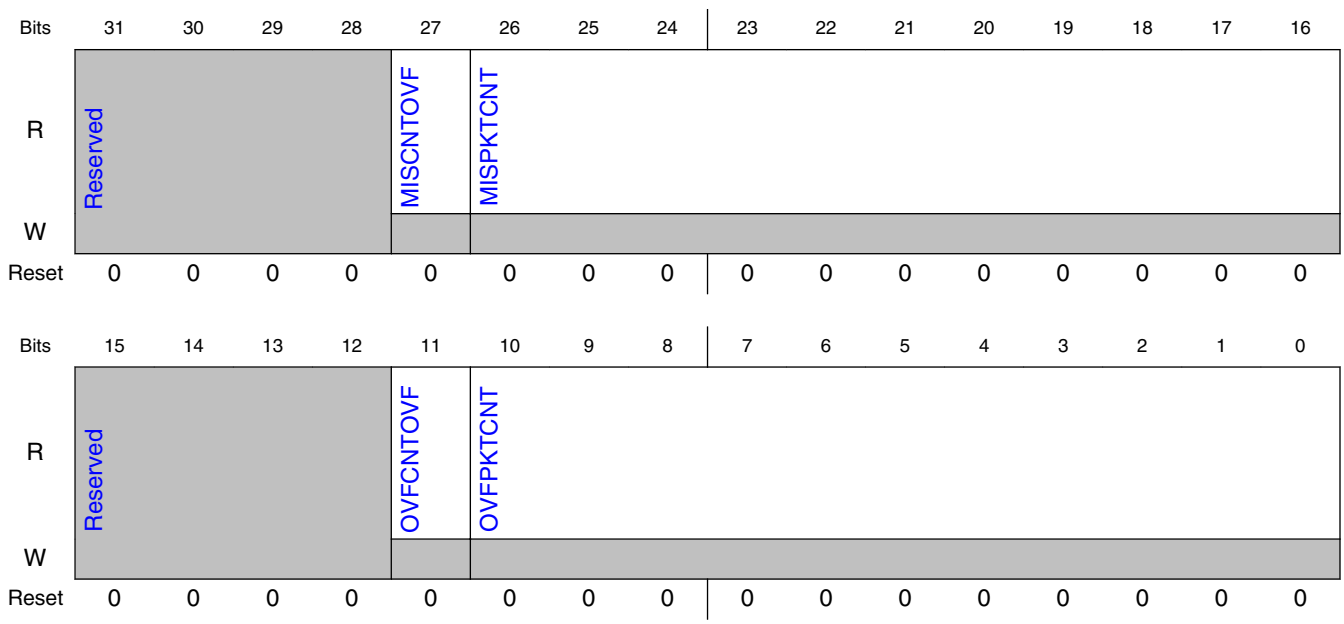
24-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved

Table continues on the next page...

Field	Description
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1. Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled

Table continues on the next page...

Field	Description
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128



11.7.6.1.442 Queue 3 Missed Packet and Overflow Counter (MTL_RXQ3_MISSED_PACKET_OVERFLOW_CNT)

The Queue 3 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

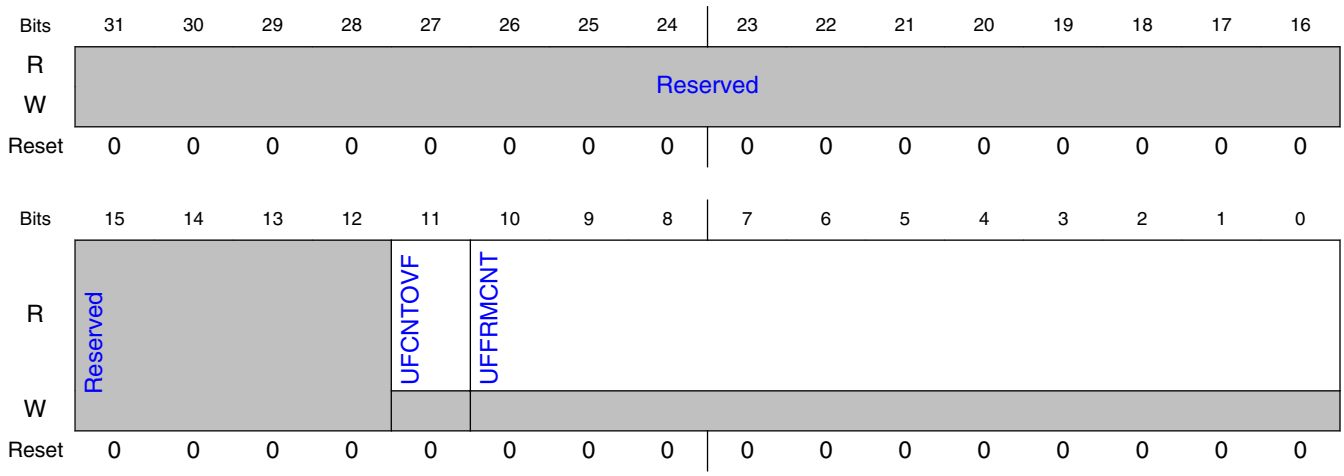
20-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000 - 32 001 - 64 010 - 96 011 - 128 100 - 192 101 - 256 110 - 384 111 - 512

Table continues on the next page...

Field	Description
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00 - Not enabled 01 - Enable in AV mode (Reserved in non-AV) 10 - Enabled 11 - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ1_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Flush Transmit Queue is disabled 1 - Flush Transmit Queue is enabled



11.7.6.1.446 Queue 4 Underflow Counter (MTL_TXQ4_UNDERFLOW)

The Queue 4 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

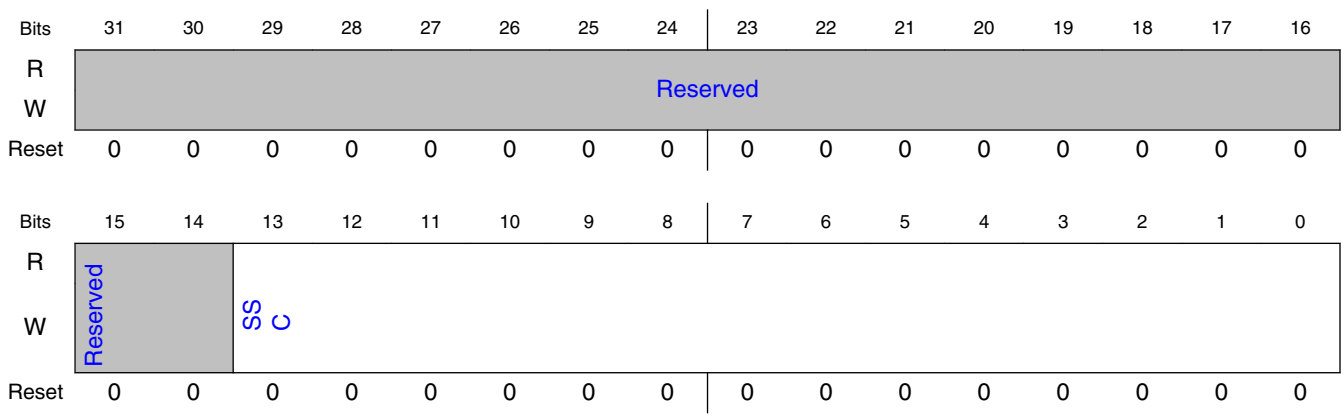
11.7.6.1.450.3 Fields

Field	Description
31-21 —	Reserved
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is OPERATION_MODE register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size))

Field	Description
	- Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.



11.7.6.1.451 Queue 4 sendSlopeCredit (MTL_TXQ4_SENDSLOPECREDIT)

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

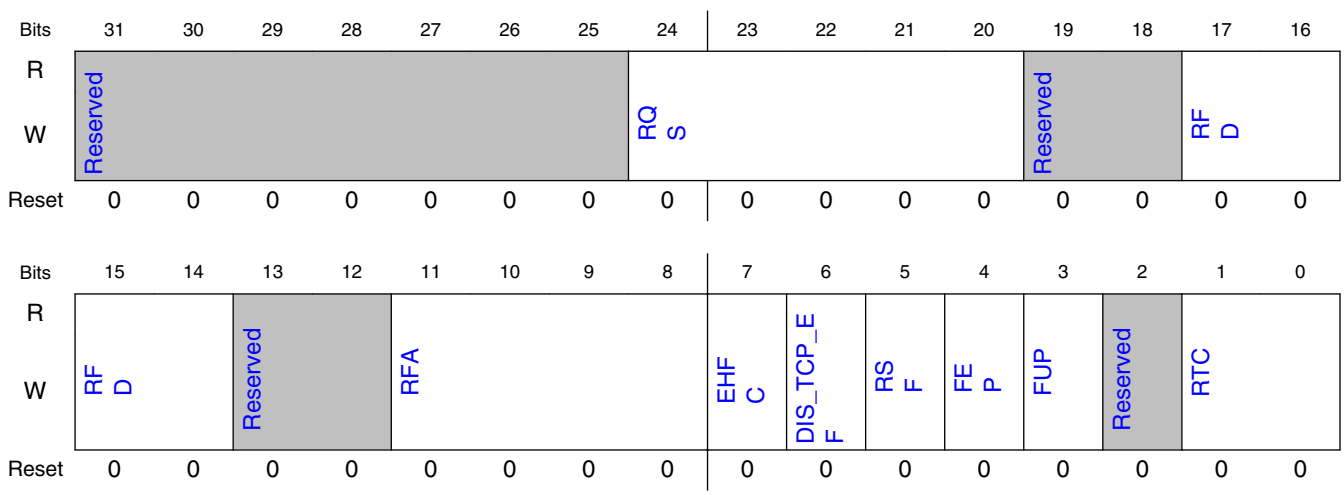
When this bit is cleared, the interrupt is not asserted for such an event. 0 - Average Bits Per Slot Interrupt is disabled 1 - Average Bits Per Slot Interrupt is enabled
8 TXUIE	Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0 - Transmit Queue Underflow Interrupt Status is disabled 1 - Transmit Queue Underflow Interrupt Status is enabled
7-2 —	Reserved
1 ABPSIS	Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Average Bits Per Slot Interrupt Status not detected 1 - Average Bits Per Slot Interrupt Status detected
0 TXUNFIS	Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

Field	Description
	0 - Transmit Queue Underflow Interrupt Status not detected 1 - Transmit Queue Underflow Interrupt Status detected

11.7.6.1.455 Queue 4 Receive Operation Mode (MTL_RXQ4_OPERATION_MODE)



The Queue 4 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

11.7.6.1.455.1 Offset

Register	Offset
MTL_RXQ4_OPERATION_MODE	E30h

11.7.6.1.455.2 Diagram

11.7.6.1.455.3 Fields

Field	Description
31-25	Reserved

Table continues on the next page...

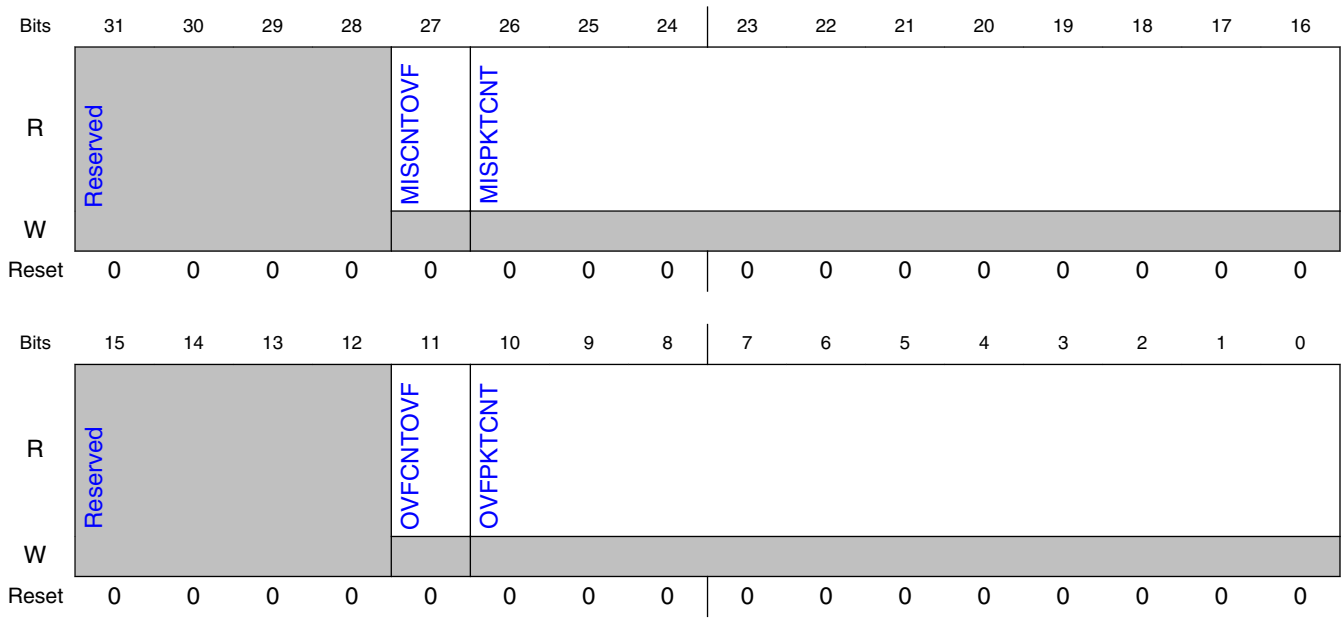
Field	Description
—	
24-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1. Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control

Table continues on the next page...

Field	Description
	When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved

Table continues on the next page...

Field	Description
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128



11.7.6.1.456 Queue 4 Missed Packet and Overflow Counter (MTL_RXQ4_MISSED_PACKET_OVERFLOW_CNT)

The Queue 4 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

When this bit is set to 1, the descriptor writes are non-posted only when IOC (Interrupt on completion) is set in last descriptor, otherwise the descriptor writes are always posted. 0 - Descriptor Posted Write is disabled 1 - Descriptor Posted Write is enabled
7-5 —	Reserved
4-2 —	Reserved
1 —	Reserved
0 SWR	Software Reset When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. Software Reset

Field	Description
	When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all DWC_ether_qos clock domains. Before reprogramming any DWC_ether_qos register, a value of zero should be read in this bit. This bit must be read at least 4 CSR clock cycles after it is written to 1. Note: The reset operation is complete only when all resets in all active clock domains are de-asserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Software Reset is disabled 1 - Software Reset is enabled

11.7.6.1.460 DMA System Bus Mode (DMA_SYSBUS_MODE)

The System Bus mode register controls the behavior of the AHB or AXI master. It mainly controls burst splitting and number of outstanding requests.

28 EDSE	Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0 - Enhanced Descriptor is disabled 1 - Enhanced Descriptor is enabled
27-24 —	Reserved
23 —	Reserved
22 —	Reserved
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled

Table continues on the next page...

Field	Description
	1 - Ignore PBL Requirement is enabled
14-13 —	Reserved
12 —	Reserved

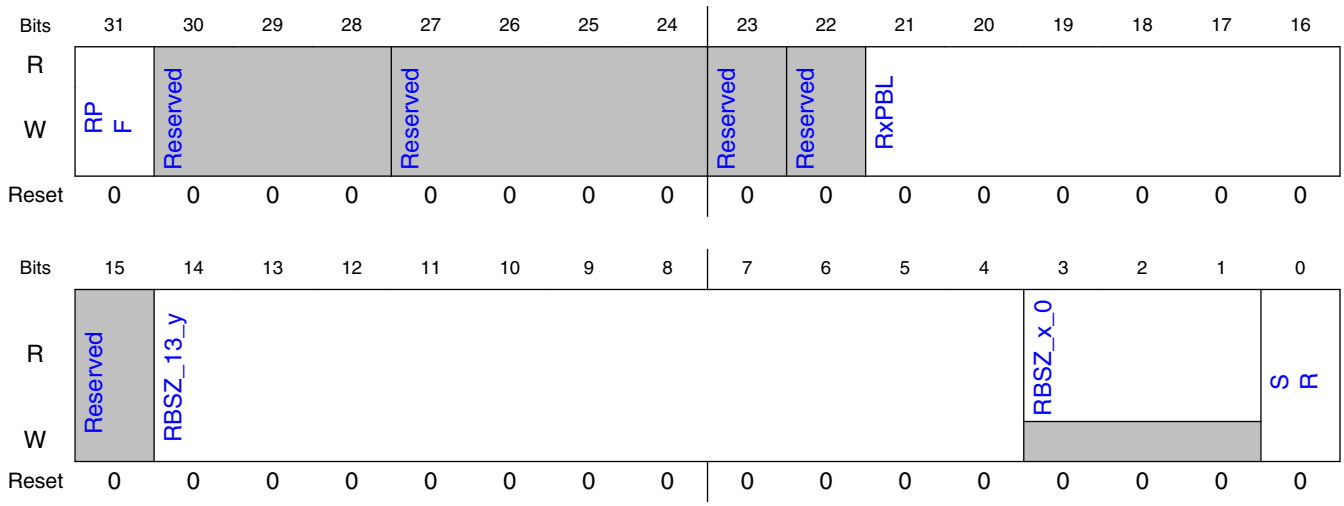
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0 - Operate on Second Packet disabled 1 - Operate on Second Packet enabled
3-1 —	Reserved
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command



11.7.6.1.468 DMA Channel 0 Receive Control (DMA_CH0_RX_CONTROL)

The DMA Channel 0 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

11.7.6.1.468.1 Offset

Register	Offset
DMA_CH0_RX_CONTROL	1108h

11.7.6.1.468.2 Diagram

11.7.6.1.468.3 Fields

Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled

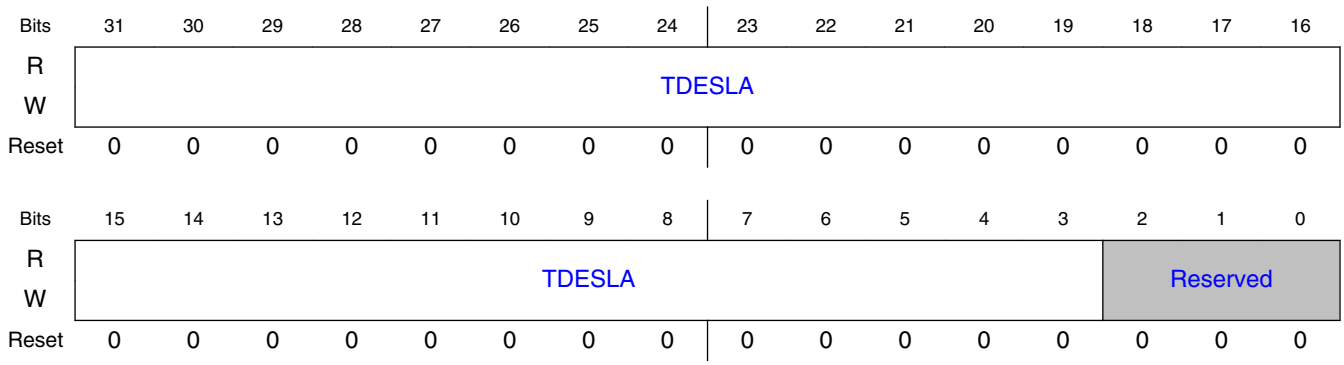
21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped

Field	Description
	If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

11.7.6.1.469 Channel 0 Tx Descriptor List Address register (DMA_CH0_TXDESC_LIST_ADDRESS)



The Channel 0 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

11.7.6.1.469.1 Offset

Register	Offset
DMA_CH0_TXDESC_LIST_ADDRESS	1114h

11.7.6.1.469.2 Diagram

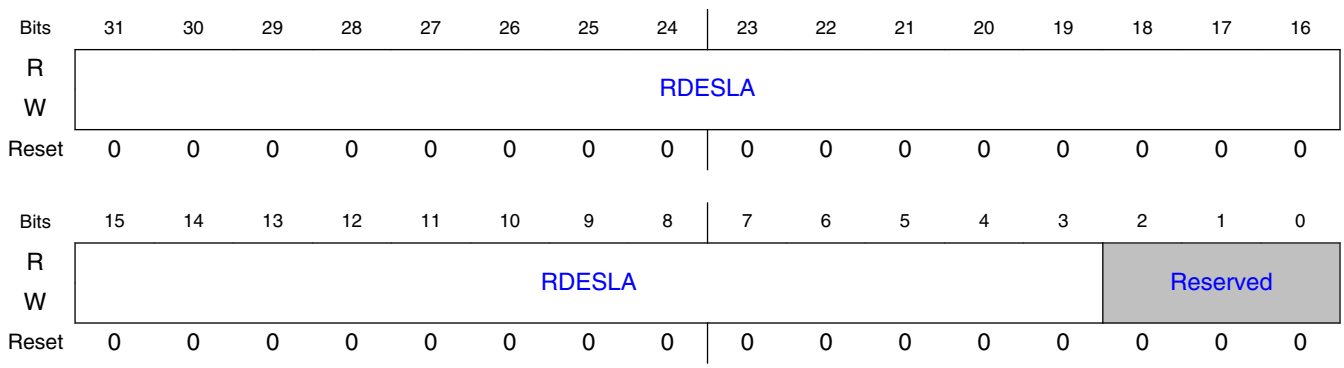
11.7.6.1.469.3 Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

11.7.6.1.470 Channel 0 Rx Descriptor List Address register (DMA_CH0_RXDESC_LIST_ADDRESS)

The Channel 0 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written



to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

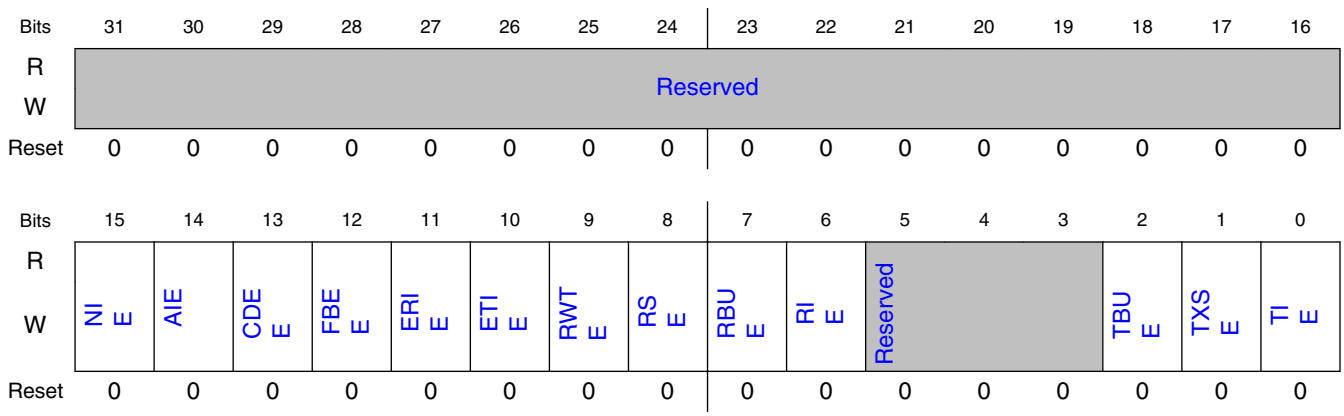
11.7.6.1.474.3 Fields

Field	Description
31-10 —	Reserved
9-0 RDRL	Receive Descriptor Ring Length This register sets the maximum number of Rx descriptors in the circular descriptor ring. Receive Descriptor Ring Length This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.



11.7.6.1.475 Channel 0 Interrupt Enable (DMA_CH0_INTERRUPT_ENABLE)

The Channel 0 Interrupt Enable register enables the interrupts reported by the Status register.

11.7.6.1.475.1 Offset

Register	Offset
DMA_CH0_INTERRUPT_ENABLE	1134h

11.7.6.1.475.2 Diagram

11.7.6.1.475.3 Fields

Field	Description
31-16 —	Reserved
15 NIE	Normal Interrupt Summary Enable When this bit is set, the normal interrupt summary is enabled. Normal Interrupt Summary Enable When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the STATUS register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled.

Table continues on the next page...

Field	Description
	0 - Normal Interrupt Summary is disabled 1 - Normal Interrupt Summary is enabled
14 AIE	Abnormal Interrupt Summary Enable When this bit is set, the abnormal interrupt summary is enabled. Abnormal Interrupt Summary Enable When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the STATUS register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0 - Abnormal Interrupt Summary is disabled 1 - Abnormal Interrupt Summary is enabled
13 CDEE	Context Descriptor Error Enable When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. Context Descriptor Error Enable When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0 - Context Descriptor Error is disabled 1 - Context Descriptor Error is enabled
12 FBEE	Fatal Bus Error Enable When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. Fatal Bus Error Enable When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0 - Fatal Bus Error is disabled 1 - Fatal Bus Error is enabled
11 ERIE	Early Receive Interrupt Enable When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. Early Receive Interrupt Enable When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0 - Early Receive Interrupt is disabled 1 - Early Receive Interrupt is enabled
10 ETIE	Early Transmit Interrupt Enable When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. Early Transmit Interrupt Enable When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled.

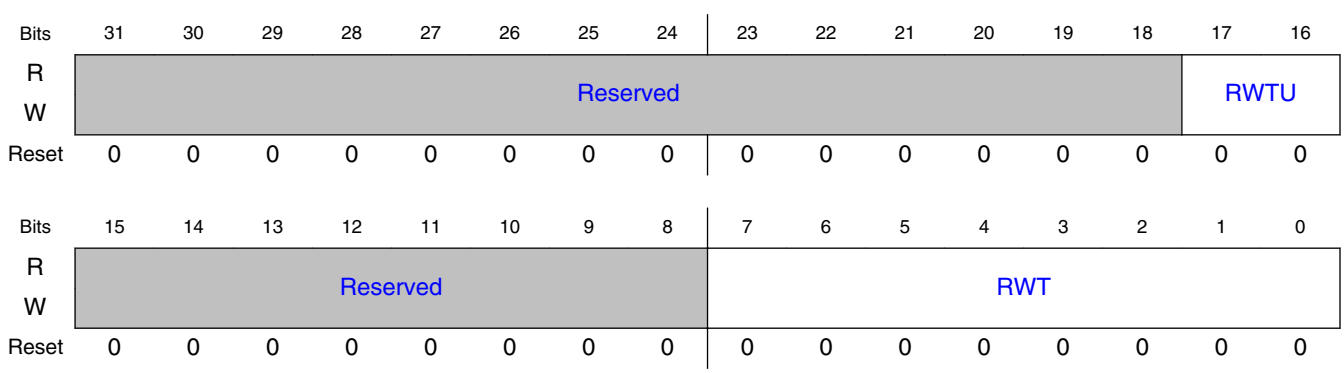
Table continues on the next page...

Field	Description
	0 - Early Transmit Interrupt is disabled 1 - Early Transmit Interrupt is enabled
9 RWTE	Receive Watchdog Timeout Enable When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. Receive Watchdog Timeout Enable When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0 - Receive Watchdog Timeout is disabled 1 - Receive Watchdog Timeout is enabled
8 RSE	Receive Stopped Enable When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. Receive Stopped Enable When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0 - Receive Stopped is disabled 1 - Receive Stopped is enabled
7 RBUE	Receive Buffer Unavailable Enable When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. Receive Buffer Unavailable Enable When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0 - Receive Buffer Unavailable is disabled 1 - Receive Buffer Unavailable is enabled
6 RIE	Receive Interrupt Enable When this bit is set along with the NIE bit, the Receive Interrupt is enabled. Receive Interrupt Enable When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0 - Receive Interrupt is disabled 1 - Receive Interrupt is enabled
5-3 —	Reserved
2 TBUE	Transmit Buffer Unavailable Enable When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. Transmit Buffer Unavailable Enable When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0 - Transmit Buffer Unavailable is disabled 1 - Transmit Buffer Unavailable is enabled
1 TXSE	Transmit Stopped Enable When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. Transmit Stopped Enable When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled.

Table continues on the next page...

Field	Description
	0 - Transmit Stopped is disabled 1 - Transmit Stopped is enabled
0 TIE	Transmit Interrupt Enable When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. Transmit Interrupt Enable When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0 - Transmit Interrupt is disabled 1 - Transmit Interrupt is enabled

11.7.6.1.476 Channel 0 Receive Interrupt Watchdog Timer (DMA_CH0_RX_INTERRUPT_WATCHDOG_TIMER)



The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA.

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the STATUS register.

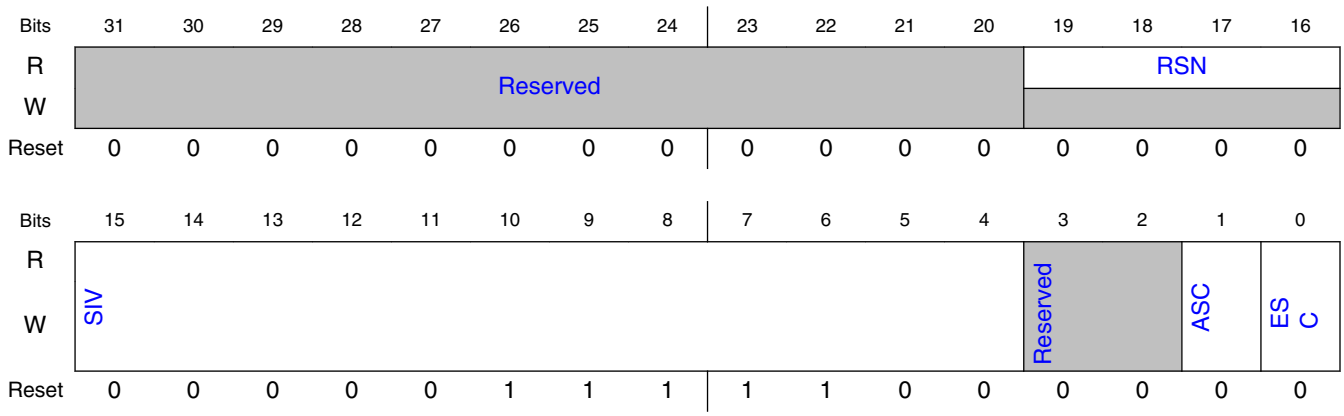
11.7.6.1.476.1 Offset

Register	Offset
DMA_CH0_RX_INTERRUPT_WATCHDOG_TIMER	1138h

11.7.6.1.476.2 Diagram

11.7.6.1.476.3 Fields

Field	Description
31-18 —	Reserved
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.



11.7.6.1.477 Channel 0 Slot Function Control and Status (DMA_CH0_SLOT_FUNCTION_CONTROL_STATUS)

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

11.7.6.1.477.1 Offset

Register	Offset
DMA_CH0_SLOT_FUNCTION_CONTROL_STATUS	113Ch

11.7.6.1.477.2 Diagram

11.7.6.1.477.3 Fields

Field	Description
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0 - Advance Slot Check is disabled 1 - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or

Field	Description
	- ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0 - Slot Comparison is disabled 1 - Slot Comparison is enabled

11.7.6.1.478 Channel 0 Current Application Transmit Descriptor (DMA_CH0_CURRENT_APP_TXDESC)

The Channel 0 Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

11.7.6.1.482.3 Fields

Field	Description
31-22 —	Reserved
21-19 REB	Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18-16 TEB	Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access

Table continues on the next page...

Field	Description
	-- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Abnormal Interrupt Summary status not detected

Table continues on the next page...

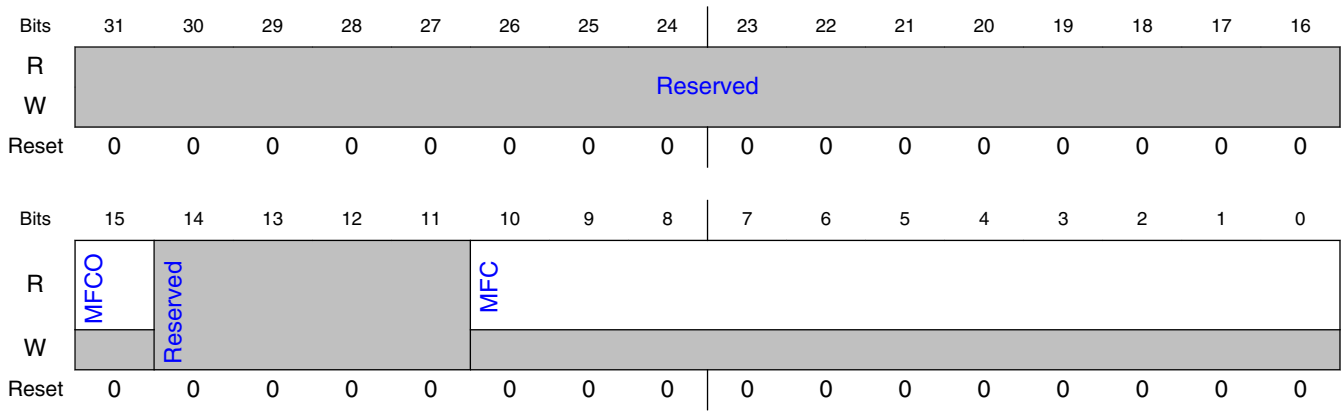
Field	Description
	1 - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all ones descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all ones descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected
9	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received.

Table continues on the next page...

Field	Description
RWT	0 - Receive Watchdog Timeout status not detected 1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

Table continues on the next page...

Field	Description
	0 - Transmit Buffer Unavailable status not detected 1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Interrupt status not detected 1 - Transmit Interrupt status detected



11.7.6.1.483 Channel 0 Missed Frame Counter (DMA_CH0_MISS_FRAME_CNT)

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in RX_CONTROL register.

11.7.6.1.483.1 Offset

Register	Offset
DMA_CH0_MISS_FRAME_CNT	1164h

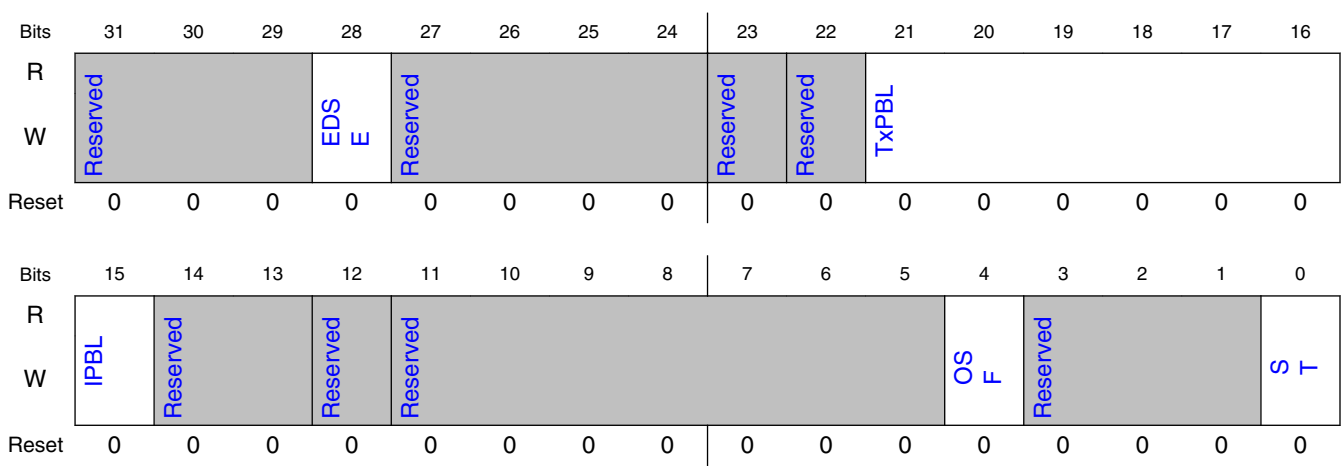
24 —	Reserved
23-21 —	Reserved
20-18 DSL	Descriptor Skip Length This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. Descriptor Skip Length This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor.

Table continues on the next page...

Field	Description
	When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17 —	Reserved
16 PBLx8	8xPBL mode When this bit is set, the PBL value programmed in Bits[21:16] in TX_CONTROL and Bits[21:16] in DMA_CH1_RX_CONTROL is multiplied by eight times. 8xPBL mode When this bit is set, the PBL value programmed in Bits[21:16] in TX_CONTROL and Bits[21:16] in DMA_CH1_RX_CONTROL is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0 - 8xPBL mode is disabled 1 - 8xPBL mode is enabled
15-14 —	Reserved
13-0 —	Reserved



11.7.6.1.487 DMA Channel 1 Transmit Control (DMA_CH1_TX_CONTROL)

The DMA Channel 1 Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

11.7.6.1.487.1 Offset

Register	Offset
DMA_CH1_TX_CONTROL	1184h

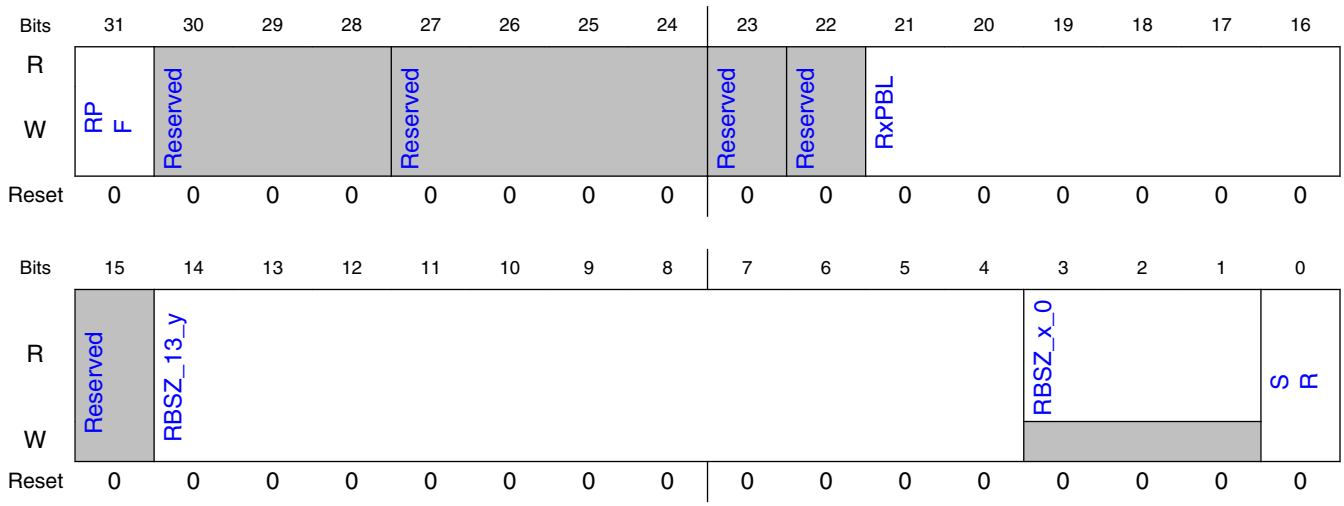
28 EDSE	Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0 - Enhanced Descriptor is disabled 1 - Enhanced Descriptor is enabled
27-24 —	Reserved
23 —	Reserved
22 —	Reserved
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled

Table continues on the next page...

Field	Description
	1 - Ignore PBL Requirement is enabled
14-13 —	Reserved
12 —	Reserved
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0 - Operate on Second Packet disabled 1 - Operate on Second Packet enabled
3-1 —	Reserved
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH1_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH1_STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH1_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command



11.7.6.1.488 DMA Channel 1 Receive Control (DMA_CH1_RX_CONTROL)

The DMA Channel 1 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

11.7.6.1.488.1 Offset

Register	Offset
DMA_CH1_RX_CONTROL	1188h

11.7.6.1.488.2 Diagram

11.7.6.1.488.3 Fields

Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled

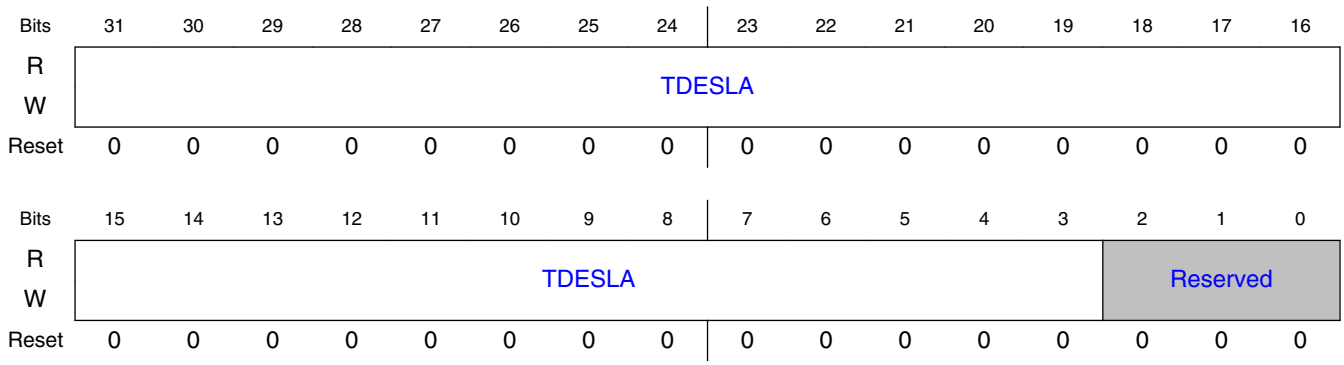
22 —	Reserved
21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH1_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped

Field	Description
	If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH1_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH1_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

11.7.6.1.489 Channel 1 Tx Descriptor List Address (DMA_CH1_TXDESC_LIST_ADDRESS)



The Channel 1 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH1_TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

11.7.6.1.489.1 Offset

Register	Offset
DMA_CH1_TXDESC_LIST_ADDRESS	1194h

11.7.6.1.489.2 Diagram

11.7.6.1.489.3 Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

11.7.6.1.490 Channel 1 Rx Descriptor List Address (DMA_CH1_RXDESC_LIST_ADDRESS)

The Channel 1 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written

to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH1_RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

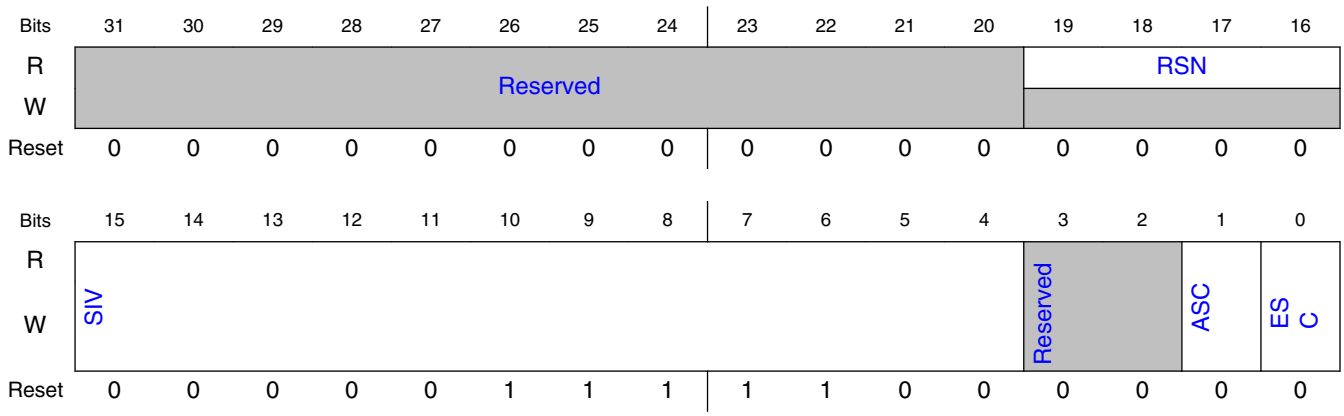
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.



11.7.6.1.497 Channel 1 Slot Function Control and Status (DMA_CH1_SLOT_FUNCTION_CONTROL_STATUS)

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

11.7.6.1.497.1 Offset

Register	Offset
DMA_CH1_SLOT_FUNCTION_CONTROL_STATUS	11BCh

11.7.6.1.497.2 Diagram

11.7.6.1.497.3 Fields

Field	Description
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0 - Advance Slot Check is disabled 1 - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or

Field	Description
	- ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0 - Slot Comparison is disabled 1 - Slot Comparison is enabled

11.7.6.1.498 Channel 1 Current Application Transmit Descriptor (DMA_CH1_CURRENT_APP_TXDESC)

The Channel 1 Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

11.7.6.1.502.3 Fields

Field	Description
31-22 —	Reserved
21-19 REB	Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18-16 TEB	Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17

Table continues on the next page...

Field	Description
	-- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH1_INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH1_INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

Table continues on the next page...

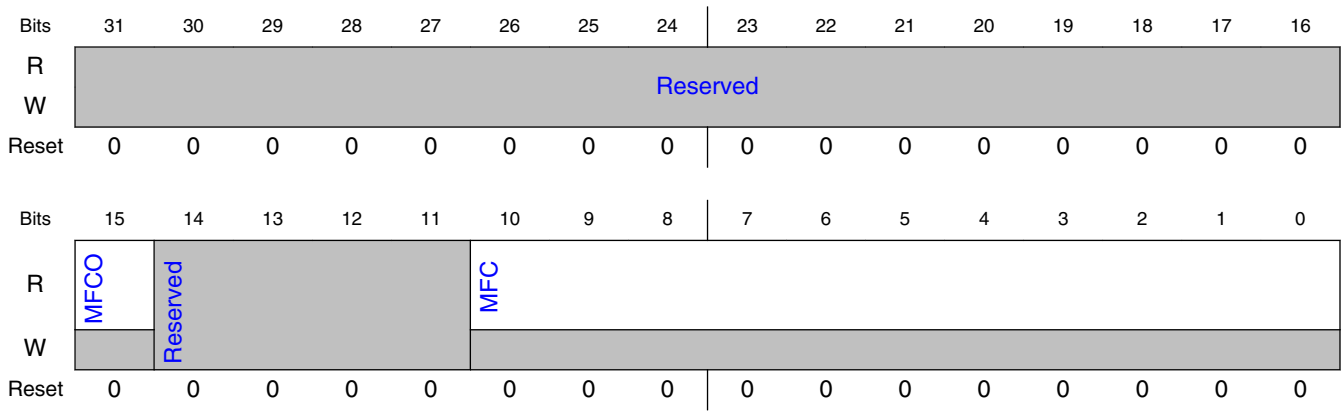
Field	Description
	0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected

Table continues on the next page...

Field	Description
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected 1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel.

Table continues on the next page...

Field	Description
	Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected 1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Interrupt status not detected 1 - Transmit Interrupt status detected



11.7.6.1.503 Channel 1 Missed Frame Counter (DMA_CH1_MISS_FRAME_CNT)

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in RX_CONTROL register.

11.7.6.1.503.1 Offset

Register	Offset
DMA_CH1_MISS_FRAME_CNT	11E4h

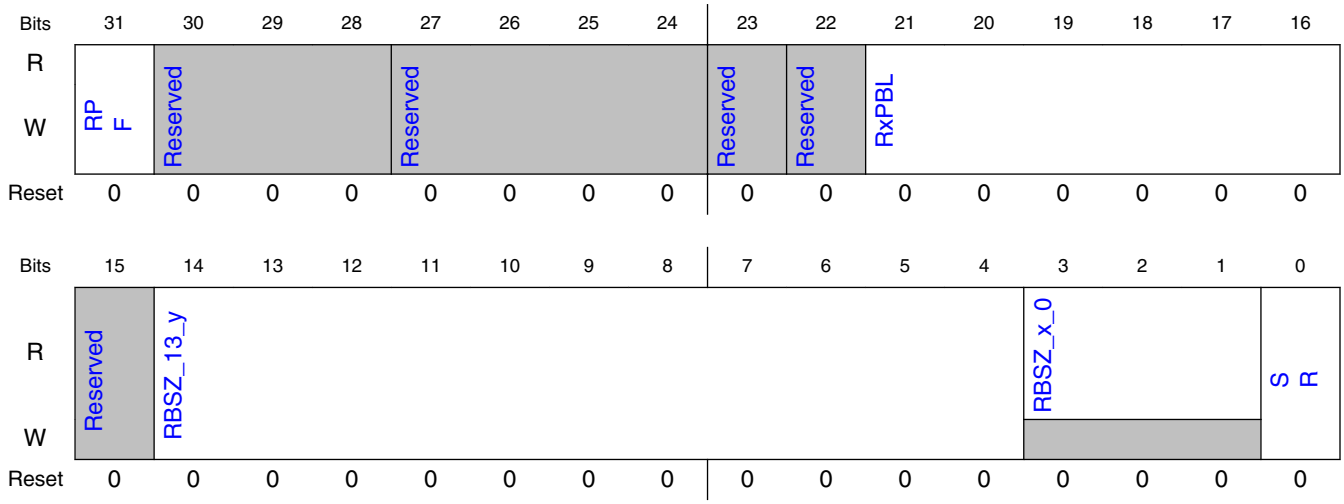
11.7.6.1.507.3 Fields

Field	Description
31-29 —	Reserved
28 EDSE	Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0 - Enhanced Descriptor is disabled 1 - Enhanced Descriptor is enabled
27-24 —	Reserved
23 —	Reserved
22 —	Reserved
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH2_CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled 1 - Ignore PBL Requirement is enabled
14-13	Reserved

Table continues on the next page...

Field	Description
—	
12 —	Reserved
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0 - Operate on Second Packet disabled 1 - Operate on Second Packet enabled
3-1 —	Reserved
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH2_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH2_STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH2_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH2_TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command



11.7.6.1.508 DMA Channel 2 Receive Control (DMA_CH2_RX_CONTROL)

The DMA Channel 2 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

11.7.6.1.508.1 Offset

Register	Offset
DMA_CH2_RX_CONTROL	1208h

11.7.6.1.508.2 Diagram

11.7.6.1.508.3 Fields

Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled

21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer.

Table continues on the next page...

Field	Description
	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH2_CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH2_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH2_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH2_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable.

Field	Description
	When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

11.7.6.1.509 Channel 2 Tx Descriptor List Address (DMA_CH2_TXDESC_LIST_ADDRESS)

The Channel 2 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

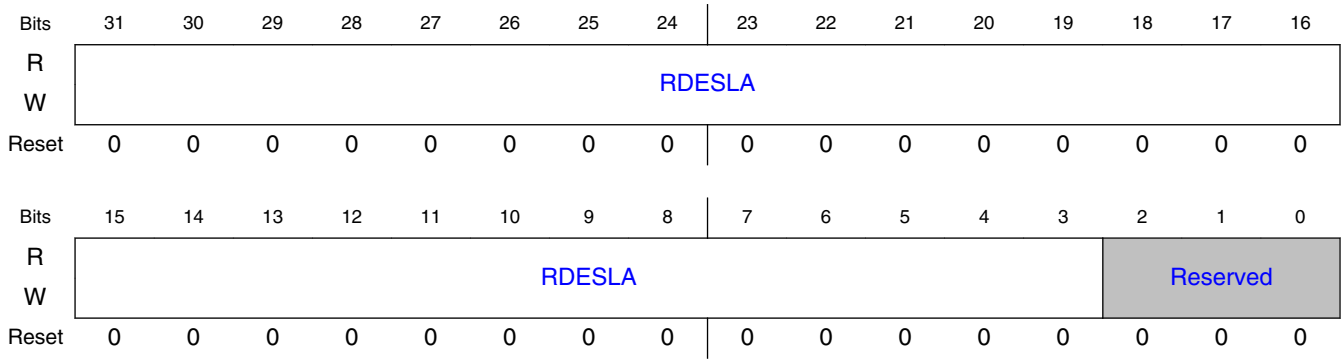
11.7.6.1.509.3 Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

11.7.6.1.510 Channel 2 Rx Descriptor List Address (DMA_CH2_RXDESC_LIST_ADDRESS)

The Channel 2 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.



This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

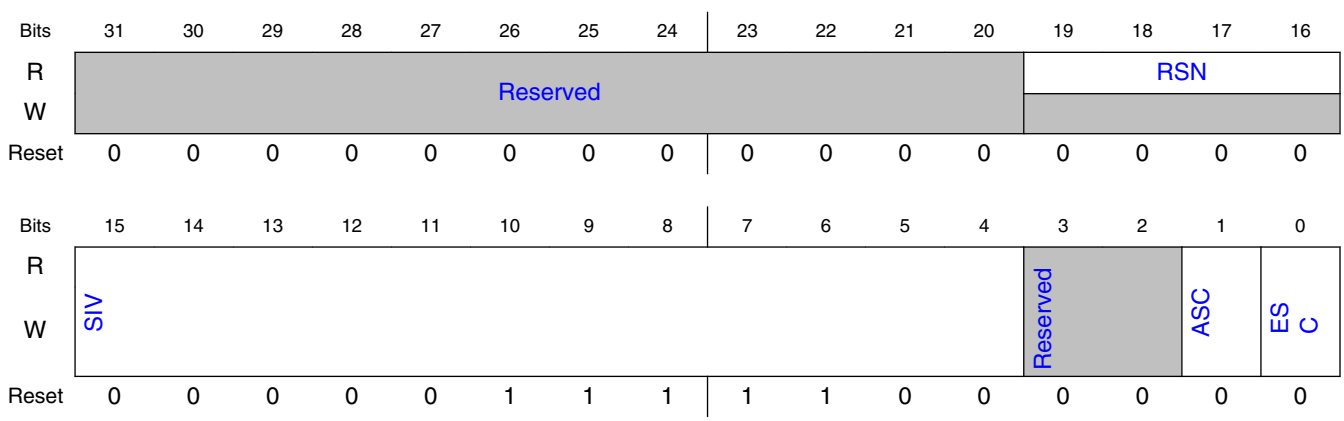
15-8 —	Reserved

Table continues on the next page...

Field	Description
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.



11.7.6.1.517 Channel 2 Slot Function Control and Status (DMA_CH2_SLOT_FUNCTION_CONTROL_STATUS)

The Channel 2 Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

11.7.6.1.522 DMA Channel 2 Status (DMA_CH2_STATUS)

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of STATUS register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

11.7.6.1.522.3 Fields

Field	Description
31-22 —	Reserved
21-19 REB	Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18-16 TEB	Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access

Table continues on the next page...

Field	Description
	- Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH2_INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH2_INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH2_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH2_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected

Table continues on the next page...

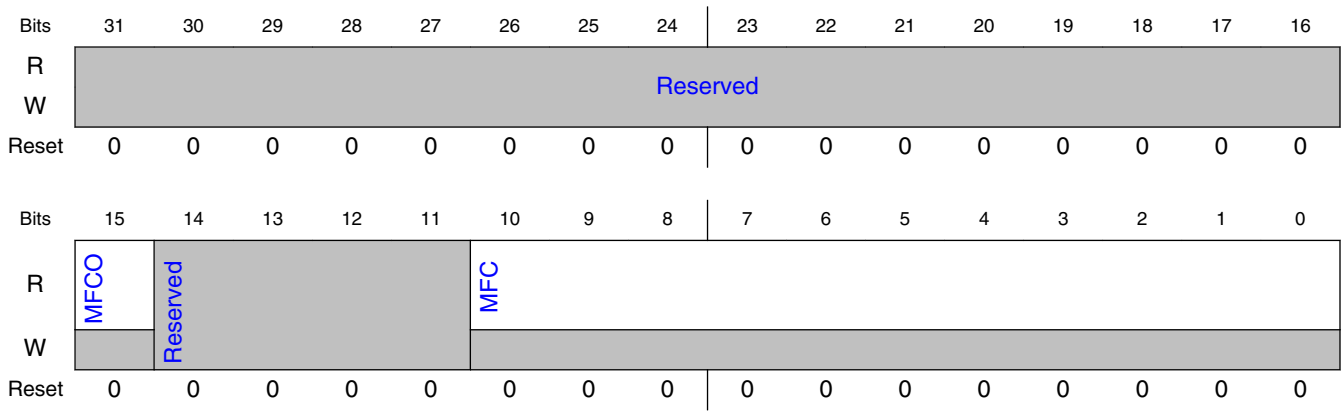
Field	Description
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected

Table continues on the next page...

Field	Description
	1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected

Table continues on the next page...

Field	Description
	1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Interrupt status not detected 1 - Transmit Interrupt status detected



11.7.6.1.523 Channel 2 Missed Frame Counter (DMA_CH2_MISS_FRAME_CNT)

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH2_RX_CONTROL register.

11.7.6.1.523.1 Offset

Register	Offset
DMA_CH2_MISS_FRAME_CNT	1264h

Field	Description
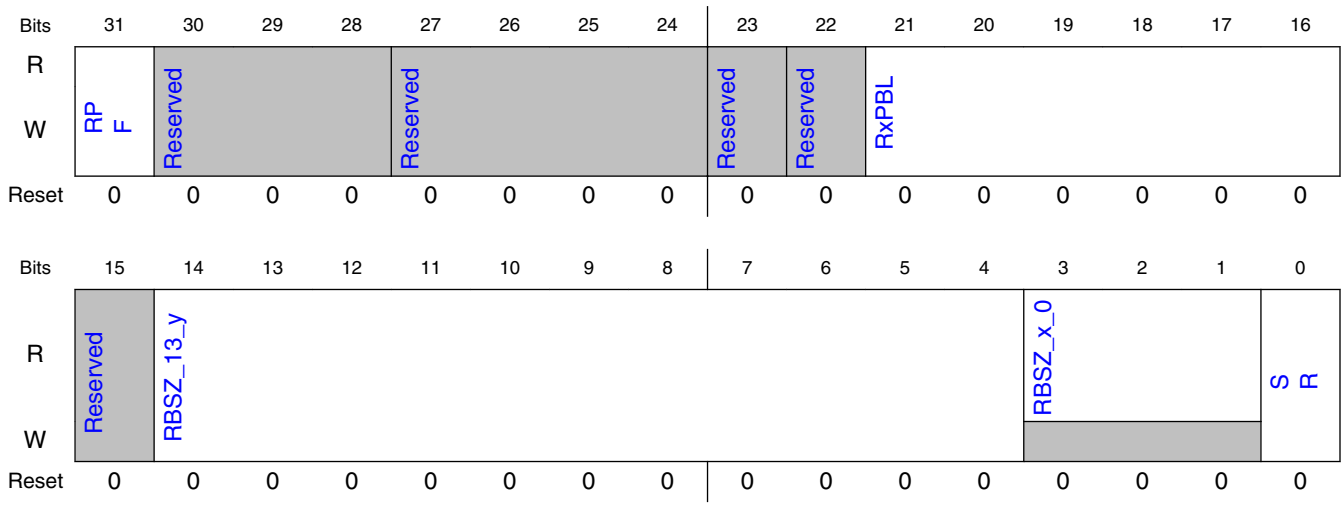
31-29 —	Reserved
28 EDSE	Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0 - Enhanced Descriptor is disabled 1 - Enhanced Descriptor is enabled
27-24 —	Reserved
23 —	Reserved
22 —	Reserved
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH3_CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled

Table continues on the next page...

Field	Description
	1 - Ignore PBL Requirement is enabled
14-13 —	Reserved
12 —	Reserved
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0 - Operate on Second Packet disabled 1 - Operate on Second Packet enabled
3-1 —	Reserved
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH3_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH3_STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH3_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH3_TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command



11.7.6.1.528 DMA Channel 3 Receive Control (DMA_CH3_RX_CONTROL)

The DMA Channel 3 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

11.7.6.1.528.1 Offset

Register	Offset
DMA_CH3_RX_CONTROL	1288h

11.7.6.1.528.2 Diagram

11.7.6.1.528.3 Fields

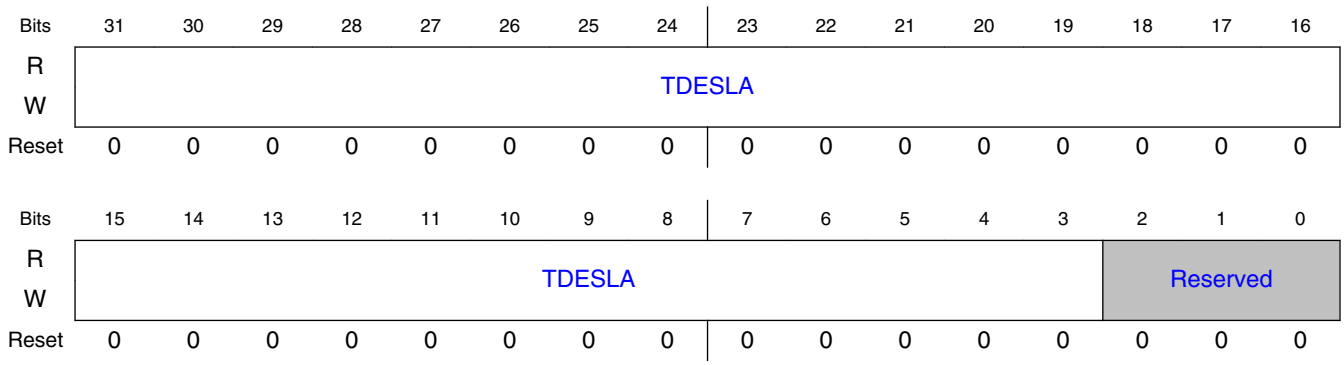
Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled
30-28 —	Reserved
27-24 —	Reserved
23	Reserved

Table continues on the next page...

Field	Description
—	
22 —	Reserved
21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH3_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped

Field	Description
	If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH3_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH3_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

11.7.6.1.529 Channel 3 Tx Descriptor List Address (DMA_CH3_TXDESC_LIST_ADDRESS)



The Channel 3 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

11.7.6.1.529.1 Offset

Register	Offset
DMA_CH3_TXDESC_LIST_ADDRESS	1294h

11.7.6.1.529.2 Diagram

11.7.6.1.529.3 Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

11.7.6.1.530 Channel 3 Rx Descriptor List Address (DMA_CH3_RXDESC_LIST_ADDRESS)

The Channel 3 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written

to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

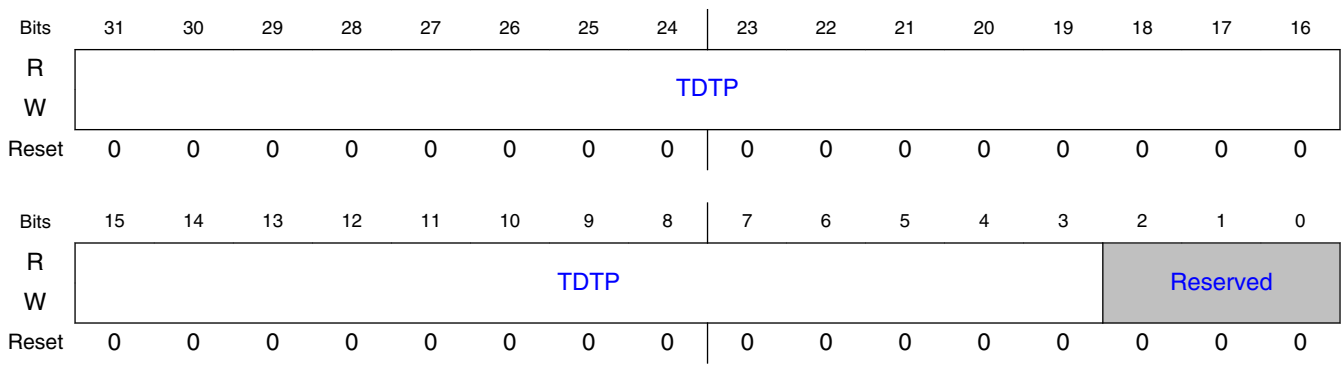
31-3 RDESLA	Start of Receive List This field contains the base address of the first descriptor in the Rx Descriptor list. Start of Receive List This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved



11.7.6.1.531 Channel 3 Tx Descriptor Tail Pointer (DMA_CH3_TXDESC_TAIL_POINTER)

The Channel 3 Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

11.7.6.1.531.1 Offset

Register	Offset
DMA_CH3_TXDESC_TAIL_POINTER	12A0h

Field	Description
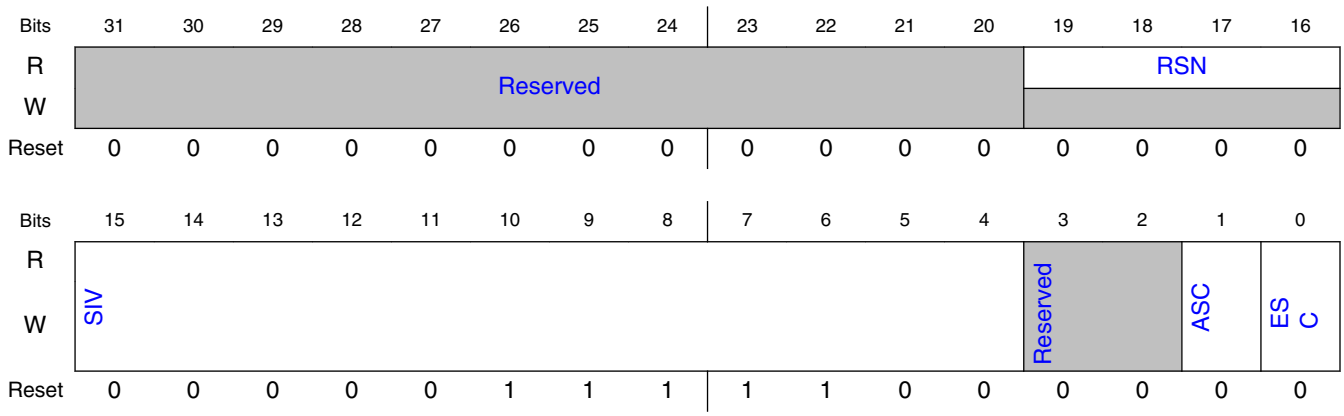
31-18 —	Reserved
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.



11.7.6.1.537 Channel 3 Slot Function Control and Status (DMA_CH3_SLOT_FUNCTION_CONTROL_STATUS)

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

11.7.6.1.537.1 Offset

Register	Offset
DMA_CH3_SLOT_FUNCTION_CONTROL_STATUS	12BCh

11.7.6.1.537.2 Diagram

11.7.6.1.537.3 Fields

Field	Description
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0 - Advance Slot Check is disabled 1 - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or

Field	Description
	- ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0 - Slot Comparison is disabled 1 - Slot Comparison is enabled

11.7.6.1.538 Channel 3 Current Application Transmit Descriptor (DMA_CH3_CURRENT_APP_TXDESC)

21-19 REB	Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18-16 TEB	Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17

Table continues on the next page...

Field	Description
	-- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH3_INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH3_INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH3_INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH3_INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH3_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH3_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

Table continues on the next page...

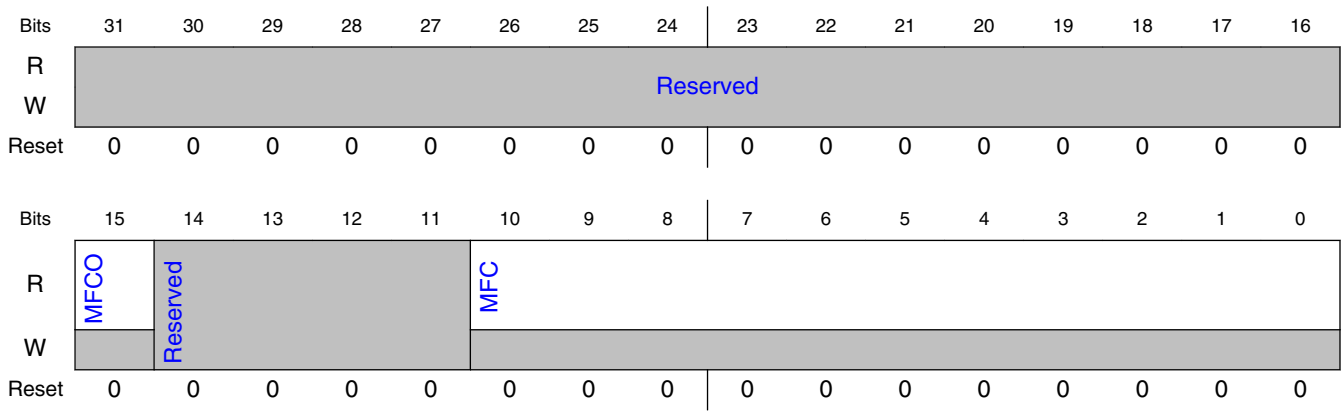
Field	Description
	0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected

Table continues on the next page...

Field	Description
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected 1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel.

Table continues on the next page...

Field	Description
	Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected 1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Interrupt status not detected 1 - Transmit Interrupt status detected



11.7.6.1.543 Channel 3 Missed Frame Counter (DMA_CH3_MISS_FRAME_CNT)

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH3_RX_CONTROL register.

When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0 - Enhanced Descriptor is disabled 1 - Enhanced Descriptor is enabled
27-24 —	Reserved
23 —	Reserved
22 —	Reserved
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled 1 - Ignore PBL Requirement is enabled
14-13	Reserved

27-24 —	Reserved
23 —	Reserved
22 —	Reserved
21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer.

Table continues on the next page...

Field	Description
	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH4_CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ[n]_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH4_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH4_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH4_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable.

Field	Description
	When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

11.7.6.1.549 Channel 4 Tx Descriptor List Address (DMA_CH4_TXDESC_LIST_ADDRESS)

The Channel 4 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

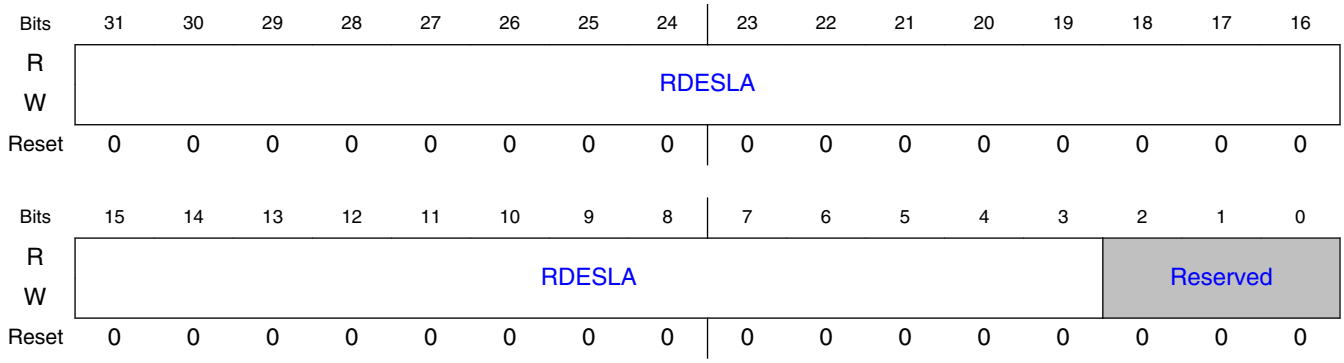
11.7.6.1.549.3 Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

11.7.6.1.550 Channel 4 Rx Descriptor List Address (DMA_CH4_RXDESC_LIST_ADDRESS)

The Channel 4 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.



This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Fatal Bus Error Enable When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled. 0 - Fatal Bus Error is disabled 1 - Fatal Bus Error is enabled
11 ERIE	Early Receive Interrupt Enable When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. Early Receive Interrupt Enable When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0 - Early Receive Interrupt is disabled 1 - Early Receive Interrupt is enabled
10 ETIE	Early Transmit Interrupt Enable When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. Early Transmit Interrupt Enable When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0 - Early Transmit Interrupt is disabled 1 - Early Transmit Interrupt is enabled
9 RWTE	Receive Watchdog Timeout Enable When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. Receive Watchdog Timeout Enable When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0 - Receive Watchdog Timeout is disabled 1 - Receive Watchdog Timeout is enabled
8 RSE	Receive Stopped Enable When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. Receive Stopped Enable When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled.

Table continues on the next page...

Field	Description
	0 - Receive Stopped is disabled 1 - Receive Stopped is enabled
7 RBUE	Receive Buffer Unavailable Enable When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. Receive Buffer Unavailable Enable When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0 - Receive Buffer Unavailable is disabled 1 - Receive Buffer Unavailable is enabled
6 RIE	Receive Interrupt Enable When this bit is set along with the NIE bit, the Receive Interrupt is enabled. Receive Interrupt Enable When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0 - Receive Interrupt is disabled 1 - Receive Interrupt is enabled
5-3 —	Reserved
2 TBUE	Transmit Buffer Unavailable Enable When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. Transmit Buffer Unavailable Enable When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0 - Transmit Buffer Unavailable is disabled 1 - Transmit Buffer Unavailable is enabled
1 TXSE	Transmit Stopped Enable When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. Transmit Stopped Enable When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0 - Transmit Stopped is disabled 1 - Transmit Stopped is enabled
0 TIE	Transmit Interrupt Enable When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. Transmit Interrupt Enable When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0 - Transmit Interrupt is disabled 1 - Transmit Interrupt is enabled

11.7.6.1.556 Channel 4 Receive Interrupt Watchdog Timer (DMA_CH4_RX_INTERRUPT_WATCHDOG_TIMER)

The Channel 4 Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the STATUS register.

11.7.6.1.556.1 Offset

Register	Offset
DMA_CH4_RX_INTERRUPT_WATCHDOG_TIMER	1338h

11.7.6.1.556.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

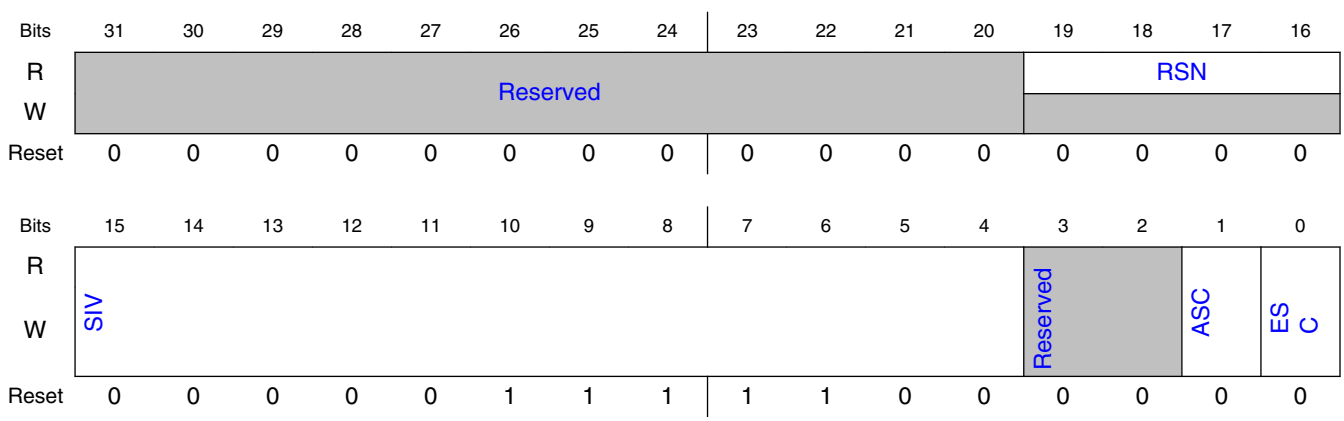
11.7.6.1.556.3 Fields

Field	Description
31-18 —	Reserved
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved

Table continues on the next page...

Field	Description
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH4_STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.



11.7.6.1.557 Channel 4 Slot Function Control and Status (DMA_CH4_SLOT_FUNCTION_CONTROL_STATUS)

The Channel 4 Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

11.7.6.1.557.1 Offset

Register	Offset
DMA_CH4_SLOT_FUNCTION_CONTROL_STATUS	133Ch

11.7.6.1.557.2 Diagram

11.7.6.1.557.3 Fields

Field	Description
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0 - Advance Slot Check is disabled 1 - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0 - Slot Comparison is disabled 1 - Slot Comparison is enabled

11.7.6.1.558 Channel 4 Current Application Transmit Descriptor (DMA_CH4_CURRENT_APP_TXDESC)

11.7.6.1.562.3 Fields

Field	Description
31-22 —	Reserved
21-19 REB	Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
18-16 TEB	Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access

Table continues on the next page...

Field	Description
	- Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected

Table continues on the next page...

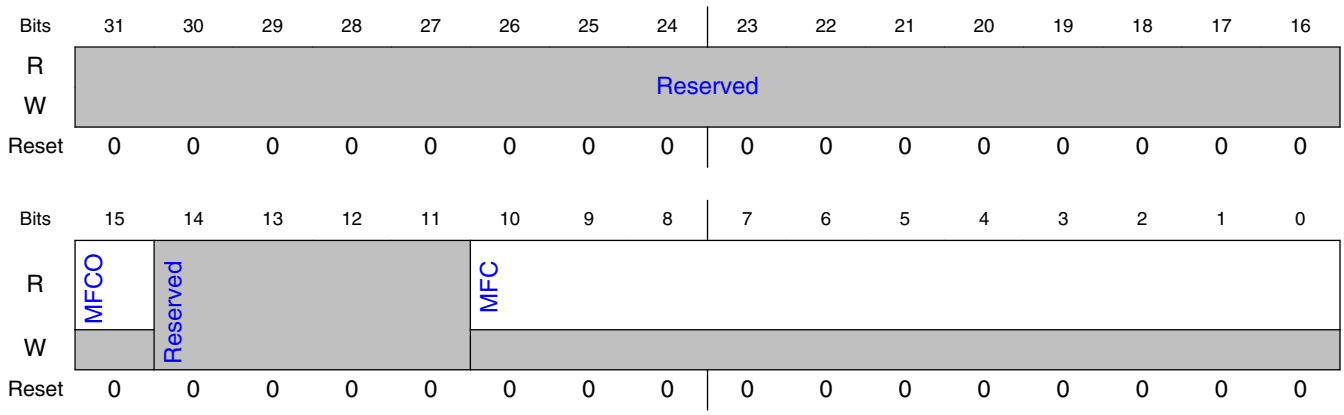
Field	Description
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected

Table continues on the next page...

Field	Description
	1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_CH4_DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected

Table continues on the next page...

Field	Description
	1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Interrupt status not detected 1 - Transmit Interrupt status detected



11.7.6.1.563 Channel 4 Missed Frame Counter (DMA_CH4_MISS_FRAME_CNT)

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH4_RX_CONTROL register.

11-0 ECNT	ERI Counter When ERIC bit of DMA_CH4_RX_CONTROL register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. ERI Counter When ERIC bit of DMA_CH4_RX_CONTROL register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter will get reset at the start of new packet.

11.8 FlexCAN

11.8.1 Overview

The FlexCAN module is a communication controller implementing the CAN protocol according to the ISO 11898-1 standard and CAN 2.0 B protocol specifications.

The CAN protocol was primarily designed to be used as a vehicle serial data bus, meeting the specific real-time processing and reliable operation requirements in the EMI environment of a vehicle. The FlexCAN module is a full implementation of the CAN protocol specification, the CAN with Flexible Data rate (CAN FD) protocol, and the CAN 2.0 version B protocol, which supports both standard and extended message frames and long payloads.

NOTE

Rx FIFO cannot be used in FD mode.

NOTE

FD mode is limited to Message Buffer (MB) mode only, the enhanced Rx FIFO with DMA support is not supported.

11.8.1.1 Block diagram

A general block diagram is shown in Figure 11-116, which describes the main subblocks implemented in the FlexCAN module.

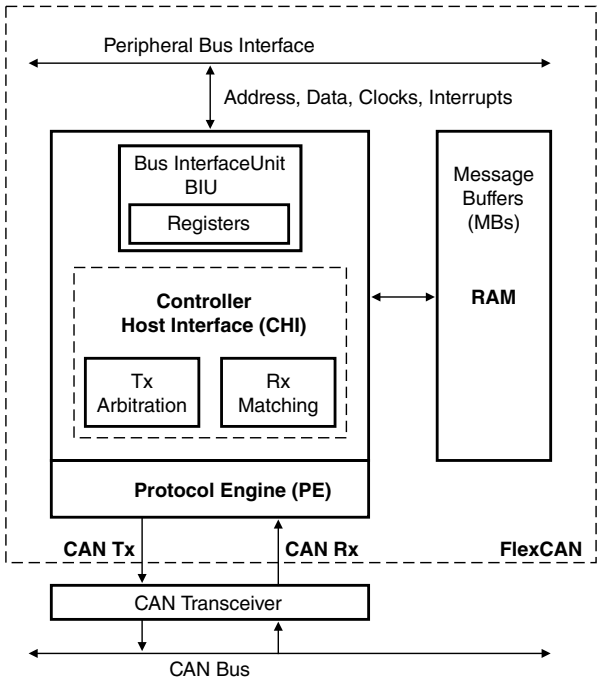

Figure 11-116. FlexCAN block diagram

The Protocol Engine (PE) submodule manages the serial communication on the CAN bus:

- Requesting RAM access for receiving and transmitting message frames
- Validating received messages
- Performing error handling
- Detecting CAN FD messages

The Controller Host Interface (CHI) submodule manages message buffer selection for reception and transmission, taking care of arbitration and ID matching algorithms for both CAN FD and non-CAN FD message formats.

The Bus Interface Unit (BIU) submodule controls access to and from the internal interface bus, in order to establish connection to the CPU and to other blocks. Clocks, address and data buses, interrupt outputs, DMA and test signals are accessed through the BIU.

11.8.1.2 Features

The FlexCAN module includes these distinctive features:

- Full implementation of the CAN with Flexible Data Rate (CAN FD) protocol specification and CAN protocol specification, Version 2.0 B
  - Standard data frames

  - Extended data frames
  - Zero to sixty four bytes data length
  - Content-related addressing
- Compliant with the ISO 11898-1 standard
- Flexible mailboxes configurable to store 0 to 8, 16, 32, or 64 bytes data length
- Each mailbox configurable as receive or transmit, all supporting standard and extended messages
- Individual Rx Mask registers per mailbox
- Full-featured Rx FIFO with storage capacity for up to six frames and automatic internal pointer handling with DMA support
- Transmission abort capability
- Flexible message buffers (MBs), totaling 64 message buffers of 8 bytes data length each, configurable as Rx or Tx
- Programmable clock source to the CAN Protocol Interface, either peripheral clock or oscillator clock
- RAM not used by reception or transmission structures can be used as general purpose RAM space
- Listen-Only mode capability
- Programmable Loop-Back mode supporting self-test operation
- Programmable transmission priority scheme: lowest ID, lowest buffer number, or highest priority
- Time stamp based on 16-bit free running timer
- Global network time, synchronized by a specific message
- Maskable interrupts
- Independence from the transmission medium (an external transceiver is assumed)
- Short latency time due to an arbitration scheme for high-priority messages
- Low power modes, with programmable wakeup on bus activity
- Transceiver delay compensation feature when transmitting CAN FD messages at faster data rates
- Remote request frames may be managed automatically or by software
- CAN bit time settings and configuration bits can only be written in Freeze mode
- Tx mailbox status (Lowest priority buffer or empty buffer)
- Identifier Acceptance Filter Hit Indicator (IDHIT) register for received frames
- SYNCH bit available in Error in Status 1 register to indicate that the module is synchronous with CAN bus
- CRC status for transmitted message
- Rx FIFO Global Mask register
- Selectable priority between mailboxes and Rx FIFO during matching process
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard, or 512 partial (8 bit) IDs, with up to 32 individual masking capability

- 100% backward compatibility with previous FlexCAN version
- Supports detection and correction of errors in memory read accesses

  Each byte of FlexCAN memory is associated to 5 parity bits, and the error correction mechanism ensures that in this 13-bit word, errors in one bit can be corrected (correctable errors) and errors in 2 bits can be detected but not corrected (non-correctable errors).

11.8.2 Functional description

The FlexCAN module is a CAN protocol engine with a very flexible mailbox system for transmitting and receiving CAN frames. The mailbox system is composed of a set of message buffers (MB) that store configuration and control data, time stamp, message ID, and data (see Message buffer structure).

For Classical CAN frames, simultaneous reception through FIFO and mailbox is supported. For CAN FD frames, reception is supported through mailboxes only. For mailbox reception, a matching algorithm makes it possible to store received frames only into MBs that have the same ID programmed in the ID field. A masking scheme makes it possible to match the ID programmed on the MB with a range of IDs on received CAN frames. For transmission, an arbitration algorithm decides the prioritization of MBs to be transmitted based on the message ID (optionally augmented by 3 local priority bits) or the MB ordering.

Before proceeding with the functional description, an important concept must be explained. A message buffer is said to be active at a given time if it can participate in both the matching and arbitration processes. An Rx MB with a 0b code is inactive (see Table 11-185). Similarly, a Tx MB with a 1000b or 1001b code is also inactive (see Table 11-186).

The FlexCAN module is also able to receive and transmit messages in CAN FD format. The message buffers are sized to adequately store the quantity of data bytes selected by the FDCTRL[MBDSRn] fields. The quantity of FD MBs available for a given quantity of data bytes is described in the FDCTRL register. See also FlexCAN memory partition for CAN FD.

11.8.2.1 Modes of operation

The FlexCAN module has these functional modes:

- Normal mode (User or Supervisor):

In Normal mode, the module operates receiving and/or transmitting message frames, errors are managed normally, and all CAN Protocol functions are enabled. User and Supervisor modes differ in the access to some restricted control registers.

- Freeze mode:

  Freeze mode is enabled when MCR[FRZ] is asserted. If enabled, Freeze mode is entered when MCR[HALT] is set or when is requested at chip level and MCR[FRZ_ACK] is asserted by the FlexCAN. In this mode, no transmission or reception of frames is done and synchronicity to the CAN bus is lost. See Freeze mode for more information.

- Loop-Back mode:

  The module enters this mode when CTRL1[LPB] is asserted. In this mode, FlexCAN performs an internal loop back that can be used for self-test operation. The bit stream output of the transmitter is internally fed back to the receiver input. The Rx CAN input pin is ignored and the Tx CAN output goes to the recessive state (logic '1'). FlexCAN behaves as it normally does when transmitting and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field to ensure proper reception of its own message. Both transmit and receive interrupts are generated.

- Listen-Only mode:

  The module enters this mode when CTRL1[LOM] is asserted. In this mode, transmission is disabled, all error counters are frozen, and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FlexCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.

- CAN FD Active mode:

  In this mode, FlexCAN is capable of transmitting and receiving all messages formatted according to the CAN FD Standard (2.0) and 2.0B Protocol in an interleaved fashion. The CPU can set the FlexCAN into CAN FD Active mode by configuring MCR[FDEN] in Freeze mode.

  It is important to know which features are available in CAN FD active mode. This table lists the differences between FD and classical modes.

Table 11-158. Differences between CAN classical and CAN FD

Feature	CAN classical	CAN FD
Rx FIFO DMA	Yes	No
Rx FIFO	Yes	No

For low-power operation, the FlexCAN module has:

- Module Disable mode:

  This low-power mode is entered when MCR[MDIS] is asserted by the CPU and MCR[LPM_ACK] is asserted by FlexCAN. When disabled, the module issues a request to disable the clocks to the CAN Protocol Engine and Controller Host Interface submodules. Exit from this mode is done by negating MCR[MDIS]. See Module Disable mode for more information.

- Doze mode:

  This low power mode is entered when MCR[DOZE] is asserted and Doze mode is requested at chip level, and MCR[LPM_ACK] is asserted by FlexCAN. When in Doze mode, the module issues a request to disable the clocks to the CAN Protocol Engine and the CAN Controller-Host Interface submodules. Exit from this mode happens when MCR[DOZE] is negated, when the chip is removed from Doze mode, or when activity is detected on the CAN bus and the Self Wake Up mechanism is enabled. See Doze mode for more information.

- Stop mode:

  This low power mode is entered when Stop mode is requested at chip level and MCR[LPM_ACK] is asserted by the FlexCAN. When in Stop Mode, the module puts itself in an inactive state and then informs the CPU that the clocks can be shut down globally. Exit from this mode happens when the Stop mode request is removed, or when activity is detected on the CAN bus and the Self Wake Up mechanism is enabled. See Stop mode for more information.

11.8.2.1.1 Modes of operation details

The FlexCAN module has functional modes and low-power modes. See Modes of operation for an introductory description of all the modes of operation. The following sub-sections contain functional details on Freeze mode and the low-power modes.

CAUTION

"Permanent Dominant" failure on CAN Bus line is not supported by FlexCAN. If a Low-Power request or Freeze mode request is done during a "Permanent Dominant", the corresponding acknowledge can never be asserted.

11.8.2.1.1.1 Freeze mode

This mode is requested either by the CPU through the assertion of MCR[HALT] or when the chip is put into Debug mode. In both cases it is also necessary that MCR[FRZ] be asserted and the module not be in a low-power mode. This mode is also requested by FlexCAN through the automatic assertion of both MCR[HALT] and MCR[FRZ] when MECR[NCEFAFRZ] is set and a non-correctable error is detected in a memory read access performed by FlexCAN internal processes (see Response to errors).

The acknowledgement is obtained through the assertion by the FlexCAN of MECR[FRZ_ACK]. The CPU must only consider the FlexCAN in Freeze mode when both request and acknowledgement conditions are satisfied.

When Freeze mode is requested, FlexCAN does the following:

- Waits to be in either Intermission, Passive Error, Bus Off, or Idle state.
- Waits for all internal activities like arbitration, matching, move-in, and move-out to finish. A pending move-in does not prevent entering Freeze mode.
- Ignores the Rx input pin and drives the Tx pin as recessive.
- Stops the prescaler, thus halting all CAN protocol activities.
- Grants write access to the Error Counters register, which is read-only in other modes.
- Sets MCR[NOTRDY] and MCR[FRZACK].

After requesting Freeze mode, the user must wait for MCR[FRZ_ACK] to be asserted before executing any other action; otherwise FlexCAN may operate in an unpredictable way. In Freeze mode, all memory-mapped registers are accessible, except for CTRL1[CLKSRC], which can be read but cannot be written.

Exiting Freeze mode is done in one of the following ways:

- CPU negates MCR[FRZ].
- The chip is removed from Debug mode and/or the HALT bit is negated.

MCR[FRZ_ACK] is negated after the protocol engine recognizes the negation of the freeze request. When out of Freeze mode, FlexCAN tries to resynchronize to the CAN bus by waiting for 11 consecutive recessive bits.

11.8.2.1.1.2 Module Disable mode

This low-power mode is normally used to temporarily disable a complete FlexCAN block, with no power consumption. It is requested by the CPU through the assertion of MCR[MDIS], and the acknowledgement is obtained through the assertion by the FlexCAN of MCR[LPMACK]. The CPU must only consider the FlexCAN in Disable mode when both request and acknowledgement conditions are satisfied.

If the module is disabled during Freeze mode, it requests to disable the clocks to the PE and CHI submodules, sets MCR[LPMACK] and negates MCR[FRZACK].

If the module is disabled during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and then checks it to be recessive.
- Waits for all internal activities like arbitration, matching, move-in, and move-out to finish. A pending move-in is not taken into account.
- Ignores its Rx input pin and drives its Tx pin as recessive.
- Shuts down the clocks to the PE and CHI submodules
- Sets MCR[NOTRDY] and MCR[LPMACK].

The Bus Interface Unit continues to operate, enabling the CPU to access memory-mapped registers, except the Rx Mailboxes Global Mask registers, the Rx Buffer 14 Mask register, the Rx Buffer 15 Mask register,. The message buffers, the Rx Individual Mask registers, and the reserved words within RAM may not be accessed when the module is in Disable mode. Exiting from this mode is done by negating the MDIS bit by the CPU, which causes the FlexCAN to request to resume the clocks and negate the LPMACK bit after the CAN protocol engine recognizes the negation of disable mode requested by the CPU.

11.8.2.1.1.3 Doze mode

This is a system low power mode in which the CPU bus is kept alive and a global Doze mode request is sent to all peripherals asking them to enter low-power mode. When Doze mode is globally requested, MCR[DOZE] needs to have been asserted previously for

Doze mode to be triggered. The acknowledgement is obtained through the assertion by the FlexCAN of MCR[LPMACK]. The CPU must only consider the FlexCAN to be in Doze mode when both request and acknowledgement conditions are satisfied.

If Doze mode is triggered during Freeze mode, FlexCAN requests to shut down the clocks to the PE and CHI submodules, sets MCR[LPMACK] and negates MCR[FRZACK]. If Doze mode is triggered during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive.
- Waits for all internal activities like arbitration, matching, move-in, and move-out to finish. A pending move-in is not taken into account.
- Ignores its Rx input pin and drives its Tx pin as recessive.
- Shuts down the clocks to the PE and CHI submodules.
- Sets MCR[NOTRDY] and MCR[LPMACK].

The Bus Interface Unit continues to operate, enabling the CPU to access memory-mapped registers, except the Rx Mailboxes Global Mask registers, the Rx Buffer 14 Mask register, the Rx Buffer 15 Mask register. The the message buffers, the Rx Individual Mask registers, and the reserved words within RAM may not be accessed when the module is in Doze mode.

Exiting Doze mode is done in one of the following ways:

- CPU removing the Doze mode request
- CPU negating MCR [DOZE]
- Self Wake mechanism

In the Self Wake mechanism, if MCR[SLFWAK] was set at the time FlexCAN entered Doze mode, then upon detection of a recessive to dominant transition on the CAN bus, FlexCAN negates the DOZE bit, requests to resume its clocks and negates the LPMACK after the CAN protocol engine recognizes the negation of the Doze mode request. It also sets ESR [WAKINT] and, if enabled by MCR[WAKMSK], generates a Wake-Up interrupt to the CPU. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up. The following table details the effect of SLFWAK and WAKMSK upon wakeup from Doze mode.

Table 11-159. Wakeup from Doze mode

SLFWAK	WAKINT	WAKMSK	FlexCAN clocks enabled	Wakeup interrupt generated
0	—	—	No	No
0	—	—	No	No
1	0	0	No	No
1	0	1	No	No
1	1	0	Yes	No
1	1	1	Yes	Yes

The sensitivity to CAN bus activity can be modified by applying a low-pass filter function to the Rx CAN input line when in Doze mode. (See MCR[WAKSRC].) This feature can be used to protect FlexCAN from waking up due to short glitches on the CAN bus lines. Such glitches can result from electromagnetic interference within noisy environments.

11.8.2.1.1.4 Stop mode

This is a system low-power mode in which all chip clocks can be stopped for maximum power savings. The Stop mode is globally requested by the CPU and acknowledgement is obtained through the assertion by the FlexCAN of a Stop Acknowledgement signal. The CPU must only consider the FlexCAN in Stop mode when both request and acknowledgement conditions are satisfied.

If FlexCAN receives the global Stop mode request during Freeze mode, it sets MCR[LPMACK], negates MCR[FRZACK], and then sends the Stop Acknowledge signal to the CPU, in order to shut down the clocks globally.

If Stop mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in, and move-out to finish. A pending move-in is not taken into account.
- Ignores its Rx input pin and drives its Tx pin as recessive
- Sets MCR[NOTRDY] and MCR[LPMACK]
- Sends a Stop Acknowledge signal to the CPU, so that it can shut down the clocks globally

Stop mode is exited when the CPU resumes the clocks and removes the Stop mode request. This can be as a result of the Self Wake mechanism.

In the Self Wake mechanism, if MCR[SLFWAK] was set at the time FlexCAN entered Stop mode, then upon detection of a recessive to dominant transition on the CAN bus, FlexCAN sets ESR[WAKINT] and, if enabled by MCR[WAKMSK], generates a Wake Up interrupt to the CPU. Upon receiving the interrupt, the CPU should resume the clocks and remove the Stop mode request. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up. The following table details the effect of MCR[SLFWAK] and MCR[WAKMSK] upon wakeup from Stop mode. Note that wakeup from Stop mode only works when both bits are asserted.

After the CAN protocol engine recognizes the negation of the Stop mode request, the FlexCAN negates MCR[LPMACK]. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up.

Table 11-160. Wakeup from Stop mode

SLFWAK	WAKINT	WAKMSK	Chip clocks enabled	Wakeup interrupt generated
0	—	—	No	No
0	—	—	No	No
1	0	0	No	No
1	0	1	No	No
1	1	0	No	No
1	1	1	Yes	Yes

The sensitivity to CAN bus activity can be modified by applying a low-pass filter function to the Rx CAN input line when in Stop mode. (See the description in MCR[WAKSRC].) This feature can be used to protect FlexCAN from waking up due to short glitches on the CAN bus lines. Such glitches can result from electromagnetic interference within noisy environments.

11.8.2.2 Transmit process

To transmit a CAN frame, the CPU must prepare a message buffer for transmission by executing the following procedure:

1. Check whether the respective interrupt bit is set and clear it.
2. If the MB is active (transmission pending), write the ABORT code (1001b) to the CODE field of the Control and Status word to request an abort of the transmission.
3. Wait for the corresponding IFLAG bit to be asserted by polling the IFLAG register, or by the interrupt request if enabled by the respective IMASK bit.

4. Read back the CODE field to check if the transmission was aborted or transmitted (see Transmission abort mechanism).
5. Clear the corresponding interrupt flag.
6. Write the ID register (containing the local priority if enabled via MCR[LPRIO_EN]).
7. Write payload data bytes.
8. Configure the Control and Status word with the desired configuration.
   a. Set ID type via MB_CS[IDE].
   b. Set Remote Transmission Request (if needed) via MB_CS[RTR].
   c. If MCR[FDEN] is enabled, also configure the MB_CS[EDL] and MB_CS[BRS] fields. For details about the relationship between the written value and transmitted value of the MB_CS[ESI] field, see Table 11-164.[2]
   d. Set Data Length Code in bytes via MB_CS[DLC]. See Table 11-187 for detailed information.
   e. Activate the message buffer to transmit the CAN frame by setting MB_CS[CODE] to Ch.

NOTE

It is strongly recommended that all the fields in MB_CS word be configured in only one 32-bit write operation to maximize software performance. If the fields are configured in separate writes, the MB_CS[CODE] must be the last write in the C/S word.

When the MB is activated, it participates in the arbitration process and is eventually transmitted according to its priority. When the DLC value stored in the MB selected for transmission is larger than the respective MB payload size, FlexCAN adds the necessary number of bytes with constant CCh pattern to complete the expected DLC.

At the end of the successful transmission:

- The value of the free running timer is written into the Time Stamp field.
- The CODE field in the Control and Status word is updated.
- Both CRC and FDCRC registers are updated.
- A status flag is set in the Interrupt Flag register.
- An interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The new CODE field after transmission depends on the code that was used to activate the MB (see Table 11-185 and Table 11-186 in Message buffer structure).

2. The ESI field does not need to be written, and will automatically be transmitted dominant by error active nodes and recessive by error passive nodes. Note that there is an exception if the FlexCAN is operating as a network gateway: In that case, the CPU writes the MB_CS[ESI] bit according to the error status of the node which sent the message.

When the Abort feature is enabled (MCR[AEN] is asserted), after the Interrupt flag is asserted for a mailbox configured as transmit buffer, the mailbox is blocked. Therefore the CPU is not able to update it until the Interrupt Flag is negated by the CPU. This means that the CPU must clear the corresponding IFLAG bit before starting to prepare this MB for a new transmission or reception.

NOTE

If backwards compatibility is desired (MCR[AEN] is negated), write the INACTIVE code (1000b) to the CODE field to inactivate the MB. However, in this case the pending frame may be transmitted without notification (see Mailbox inactivation).

11.8.2.3 Arbitration process

The arbitration process scans the mailboxes, searching for the Tx mailbox that holds the message to be sent in the next opportunity. This mailbox is called the arbitration winner.

The scan starts from the lowest number mailbox and runs toward the higher ones.

The arbitration process is triggered in the following events:

- From the CRC field of the CAN frame. The start point depends on the value of CTRL2[TASD].
- During the Error Delimiter field of a CAN frame.
- During the Overload Delimiter field of a CAN frame.
- When the winner is inactivated and the CAN bus has still not reached the first bit of the Intermission field.
- When there is a CPU write to the C/S word of a winner MB and the CAN bus has still not reached the first bit of the Intermission field.
- When CHI is in Idle state and the CPU writes to the C/S word of any MB.
- When FlexCAN exits Bus Off state.
- Upon leaving Freeze mode or Low Power mode.

If the arbitration process does not manage to evaluate all mailboxes before the CAN bus has reached the first bit of the Intermission field, the temporary arbitration winner is invalidated and the FlexCAN will not compete for the CAN bus in the next opportunity.

The arbitration process selects the winner among the active Tx mailboxes at the end of the scan according to the settings of both CTRL1[LBUF] and MCR[LPRIOEN].

11.8.2.3.1 Lowest-number mailbox first

If CTRL1[LBUF] is asserted, the first (lowest number) active Tx mailbox found is the arbitration winner. MCR[LPRIOEN] has no effect when CTRL1[LBUF] is asserted.

11.8.2.3.2 Highest-priority mailbox first

If CTRL1[LBUF] is negated, then the arbitration process searches the active Tx mailbox with the highest priority, which means that this mailbox's frame would have a higher probability to win the arbitration on CAN bus when multiple external nodes compete for the bus at the same time.

The sequence of bits considered for this arbitration is called the *arbitration value* of the mailbox. The highest-priority Tx mailbox is the one that has the lowest arbitration value among all Tx mailboxes.

If two or more mailboxes have equivalent arbitration values, the mailbox with the lowest number is the arbitration winner.

The composition of the arbitration value depends on the MCR[LPRIOEN] setting.

11.8.2.3.2.1 Local priority disabled

If MCR[LPRIOEN] is negated the arbitration value is built in the exact sequence of bits as they would be transmitted in a CAN frame (see the following table) in such a way that the local priority is disabled.

Table 11-161. Composition of the arbitration value when local priority is disabled

Format	Mailbox arbitration value (32 bits)				
Standard (IDE = 0)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	Extended ID[28:18] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0] (18 bits)	RTR (1 bit)

11.8.2.3.2.2 Local priority enabled

To enable local priority, MCR[LPRIOEN] must be asserted. In this case the mailbox PRIO field is included at the very left of the arbitration value (see the following table).

Table 11-162. Composition of the arbitration value when local priority is enabled

Format	Mailbox arbitration value (35 bits)					
Standard (IDE = 0)	PRIO (3 bits)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	PRIO (3 bits)	Extended ID[28:18] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0] (18 bits)	RTR (1 bit)

Because the PRIO field is the most significant part of the arbitration value, mailboxes with low PRIO values have higher priority than mailboxes with high PRIO values regardless of the rest of their arbitration values.

Note that the PRIO field is not part of the frame on the CAN bus. Its purpose is only to affect the internal arbitration process.

11.8.2.3.3 Arbitration process (continued)

After the arbitration winner is found, its content is copied to a hidden auxiliary MB called Tx Serial Message Buffer (Tx SMB), which has the same structure as a normal MB but is not user accessible. This operation is called move-out and after it is done, write access to the C/S word of the corresponding MB is blocked (if MCR[AEN] is asserted). Write access is restored in the following events:

- After the MB is transmitted and the corresponding IFLAG bit is cleared by the CPU.
- FlexCAN enters Freeze mode or Bus Off.
- FlexCAN loses the bus arbitration or there is an error during the transmission.

At the first opportunity window on the CAN bus, the message on the Tx SMB is transmitted according to the CAN protocol rules.

Arbitration process can be triggered in the following situations:

- During Rx and Tx frames from CAN CRC field to end of frame. CTRL2[TASD] value may be changed to optimize the arbitration start point.
- During CAN Bus Off state from TX_ERR_CNT=124 to 128. CTRL2[TASD] value may be changed to optimize the arbitration start point.
- During C/S write by CPU in Bus Idle. First C/S write starts arbitration process, and a second C/S write during this same arbitration restarts the process. If other C/S writes are performed, Tx arbitration process is pending. If there is no arbitration winner after the arbitration process has finished, then the TX arbitration machine begins a new arbitration process. If there is a pending arbitration and Bus Idle state starts, then an arbitration process is triggered. In this case the first and second C/S write in Bus Idle will not restart the arbitration process. It is possible that there is not enough time to finish arbitration in Wait For Bus Idle state and the next state is Idle. In this case

the scan is not interrupted, and it is completed during Bus Idle state. During this arbitration C/S write does not cause arbitration restart.
- Arbitration winner deactivation during a valid arbitration window.
- Upon exiting Freeze mode (first bit of the Wait For Bus Idle state). If there is a re-synchronization during Wait For Bus Idle, the arbitration process is restarted.

Arbitration process stops in the following situations:

- All mailboxes were scanned.
- A Tx active mailbox is found if lowest buffer feature is enabled.
- Arbitration winner inactivation or abort during any arbitration process.
- There was not enough time to finish Tx arbitration process (for instance, when a deactivation was performed near the end of frame). In this case arbitration process is pending.
- Error or overload flag in the bus.
- Low Power or Freeze mode request in Idle state.

Arbitration is considered pending as described below:

- It was not possible to finish arbitration process in time.
- C/S write during arbitration if write is performed in a MB whose number is lower than the Tx arbitration pointer.
- Any C/S write if there is no Tx arbitration process in progress.
- Rx Match has just updated a Rx code to Tx code.
- Entering Bus Off state.

C/S write during arbitration has the following effect:

- If C/S write is performed in the arbitration winner, a new process is restarted immediately.
- If C/S write is performed in a MB whose number is higher than the Tx arbitration pointer, the ongoing arbitration process will scan this MB as normal.

11.8.2.4 Receive process

To be able to receive CAN frames into a mailbox, the CPU must prepare it for reception by executing the following steps:

1. If the mailbox is active (either Tx or Rx) inactivate the mailbox (see Mailbox inactivation), preferably with a safe inactivation (see Transmission abort mechanism).
2. Write the ID word into the mailbox.

3. Write the EMPTY code (0100b) to the CODE field of the Control and Status word to activate the mailbox. No setup is required for EDL, BRS, and ESI bits—they are overwritten by the respective bit fields in the received message.

After the MB is activated, it will be able to receive frames that match the programmed filter. At the end of a successful reception, the mailbox is updated by the move-in process (see Move-in) as follows:

1. The received data field (8 bytes at most for Classical CAN message format and up to 64 bytes for CAN FD message format) is stored.
2. The received Identifier field is stored.
3. The value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the mailbox's Time Stamp field.
4. The received SRR, IDE, RTR, EDL, BRS, ESI, and DLC fields are stored.
5. The CODE field in the Control and Status word is updated (see Table 11-185 and Table 11-186 in Section Message buffer structure).
6. A status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The recommended way for the CPU to service (read) the frame received in a mailbox is by the following procedure:

1. Read the Control and Status word of that mailbox.
2. Check if the BUSY bit is deasserted, indicating that the mailbox is locked. Repeat step 1) while it is asserted. See Mailbox lock mechanism.
3. Read the contents of the mailbox. After the mailbox is locked, its contents won't be modified by FlexCAN move-in processes. See Move-in.
4. Acknowledge the proper flag at IFLAG registers.
5. Read the free running timer to unlock the mailbox.

The CPU should poll for frame reception by the status flag bit for the specific mailbox in one of the IFLAG registers and not by the CODE field of that mailbox. Polling the CODE field does not work because after a frame is received and the CPU services the mailbox (by reading the C/S word followed by unlocking the mailbox), the CODE field will not return to EMPTY. It will remain FULL, as explained in Table 11-185. If the CPU tries to work around this behavior by writing to the C/S word to force an EMPTY code after reading the mailbox without a prior safe inactivation, a newly received frame matching the filter of that mailbox may be lost.

CAUTION

In summary: never do polling by reading directly the C/S word of the mailboxes. Instead, read the IFLAG registers.

Note that the received frame's Identifier field is always stored in the matching mailbox, thus the contents of the ID field in a mailbox may change if the match was due to masking. When MCR[SRXDIS] is asserted, FlexCAN will not store frames transmitted by itself in any MB, even if it contains a matching Rx mailbox, and no interrupt flag or interrupt signal will be generated. Otherwise, when MCR[SRXDIS] is deasserted, FlexCAN can receive frames transmitted by itself if a matching Rx mailbox exists.

When MCR[DMA] is asserted, upon receiving a frame in FIFO, IFLAG1[BUF5I] generates a DMA request and does not generate a CPU interrupt (see Rx FIFO under DMA operation). The IMASK1 bits in Rx FIFO region are not used.

The DMA controller must service the received frame using the following procedure:

1. Read the Control and Status word (read 80h address, optional).
2. Read the ID field (read 84h address, optional).
3. Read all data bytes (start read at 88h address, optional).

11.8.2.5 Matching process

The matching process scans the MB memory looking for Rx MBs programmed with the same ID as the one received from the CAN bus. . The matching starts from the lowest number message buffer toward the higher ones.

For Rx FIFO see Rx FIFO.

As the frame is being received, it is stored in a hidden auxiliary MB called Rx Serial Message Buffer (Rx SMB).

The matching process start point depends on the following conditions:

- If the received frame is a remote frame, the start point is the CRC field of the frame.
- If the received frame is a data frame with DLC field equal to zero, the start point is the CRC field of the frame.
- If the received frame is a data frame with DLC field different than zero, the start point is the DATA field of the frame.

If a matching ID is found in one of the mailboxes, the contents of the Rx SMB are transferred to to the matched mailbox by the move-in process. If any CAN protocol error is detected then no match results are transferred to the matched mailbox at the end of reception.

The matching process scans all matching elements of the active Rx mailboxes (CODE is EMPTY, FULL, OVERRUN, or RANSWER) in search of a successful comparison with the matching elements of the Rx SMB that is receiving the frame on the CAN bus. The Rx SMB has the same structure as a mailbox. The reception structures (mailboxes) associated with the matching elements that had a successful comparison are the *matched structures*. The *matching winner* is selected at the end of the scan among those matched structures and depends on conditions described ahead. See the following table.

Table 11-163. Matching architecture

Structure	SMB[RTR]	CTRL2[RRS]	CTRL2[EACEN]	MB[IDE]	MB[RTR]	MB[ID[1]]	MB[CODE]
Mailbox	0	—	0	cmp[2]	no_cmp[3]	cmp_msk[4]	EMPTY or FULL or OVERRUN
Mailbox	0	—	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	0	—	cmp	no_cmp	cmp	RANSWER
Mailbox	1	1	0	cmp	no_cmp	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	1	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN

1. For mailbox structure, If SMB[IDE] is asserted, the ID is 29 bits (ID Standard + ID Extended). If SMB[IDE] is negated, the ID is only 11 bits (ID Standard). For FIFO structure, the ID depends on IDAM.
2. cmp: Compares the Rx SMB contents with the MB contents regardless the masks.
3. no_cmp: The Rx SMB contents are not compared with the MB contents.
4. cmp_msk: Compares the Rx SMB contents with MB contents taking into account the masks.

A reception structure is free-to-receive when any of the following conditions is satisfied:

- The CODE field of the mailbox is EMPTY.
- The CODE field of the mailbox is either FULL or OVERRUN and it has already been serviced (the C/S word was read by the CPU and unlocked as described in Mailbox lock mechanism).
- The CODE field of the mailbox is either FULL or OVERRUN and an inactivation (see Mailbox inactivation) is performed.

The scan order for mailboxes is from the matching element with lowest number to the higher ones.

The matching winner search for mailboxes is affected by MCR[IRMQ]. If it is negated, the matching winner is the first matched mailbox regardless if it is free-to-receive or not. If it is asserted, the matching winner is selected according to the priority below:

1. the first free-to-receive matched mailbox;

2. the last non free-to-receive matched mailbox.

If a non-safe mailbox inactivation (see Mailbox inactivation) occurs during matching process and the mailbox inactivated is the temporary matching winner, then the temporary matching winner is invalidated. The matching elements scan is not stopped nor restarted—it continues normally. The consequence is that the current matching process works as if the matching elements compared before the inactivation did not exist, therefore a message may be lost.

Suppose, for example, that IRMQ is enabled, there are two MBs with the same ID, and FlexCAN starts receiving messages with that ID. Let us say that these MBs are the second and the fifth in the array. When the first message arrives, the matching algorithm finds the first match in MB number 2. The code of this MB is EMPTY, so the message is stored there. When the second message arrives, the matching algorithm finds MB number 2 again, but it is not "free-to-receive", so it keeps looking, finds MB number 5 and stores the message there. If yet another message with the same ID arrives, the matching algorithm finds out that there are no matching MBs that are "free-to-receive", so it decides to overwrite the last matched MB, which is number 5. In doing so, it sets the CODE field of the MB to indicate OVERRUN.

The ability to match the same ID in more than one MB can be exploited to implement a reception queue to allow more time for the CPU to service the MBs. By programming more than one MB with the same ID, received messages are queued into the MBs. The CPU can examine the Time Stamp field of the MBs to determine the order in which the messages arrived.

Matching to a range of IDs is possible by using ID acceptance masks. FlexCAN supports individual masking per MB (see the description of Rx Individual Mask Registers (RXIMR0 - RXIMR63)). During the matching algorithm, if a mask bit is asserted, then the corresponding ID bit is compared. If the mask bit is negated, the corresponding ID bit is a "don't care". Note that the Individual Mask Registers are implemented in RAM, so they are not initialized out of reset. Also, they can only be programmed when the module is in Freeze mode; otherwise, they are blocked by hardware.

FlexCAN also supports an alternate masking scheme with only four mask registers (RXMGMASK, RX14MASK, and RX15MASK) for backwards compatibility with legacy applications. This alternate masking scheme is enabled when the IRMQ bit in the MCR register is negated.

11.8.2.6 Move process

There are two types of move process: move-in and move-out.

11.8.2.6.1 Move-in

The move-in process is the copy of a message received by an Rx SMB to an Rx mailbox that has matched it. Each Rx SMB has its own move-in process, but only one is performed at a given time as described ahead. The move-in starts only when the message held by the Rx SMB has a corresponding matching winner (see Matching process) and all of the following conditions are true:

- The CAN bus has either reached or already gone past:
  - The second bit of Intermission field next to the frame that carried the message that is in the Rx SMB.
  - The first bit of an overload frame next to the frame that carried the message that is in the Rx SMB.
- There is no ongoing matching process.
- The destination mailbox is not locked by the CPU.
- There is no ongoing move-in process from another Rx SMB. If more than one move-in process is to be started at the same time, both are performed and the newest substitutes for the oldest.

The term pending move-in is used throughout the documentation and stands for a move-to-be that still does not satisfy all of the aforementioned conditions.

The move-in is cancelled and the Rx SMB is able to receive another message if any of the following conditions is satisfied:

- The destination mailbox is inactivated after the CAN bus has reached the first bit of Intermission field next to the frame that carried the message and its matching process has finished.
- There is a previous pending move-in to the same destination mailbox.
- The Rx SMB is receiving a frame transmitted by the FlexCAN itself and self-reception is disabled (MCR[SRXDIS] is asserted).
- Any CAN protocol error is detected.

Note that the pending move-in is not cancelled if the module enters Freeze or Low-Power mode. It stays on hold, only waiting for Freeze and Low-Power mode to be exited and the module to be unlocked. If an MB is unlocked during Freeze mode, the move-in happens immediately.

The move-in process is the execution by the FlexCAN of the following steps:

1. Read all data words from the Rx SMB in accordance with the selected payload size for the Rx storage element.
2. Write all data words to the Rx mailbox in accordance with the selected payload size for the Rx storage element. If the data size of the storage element is smaller than the

original payload size described in the message's DLC field, the payload is truncated and the high order bytes that do not fit the destination size are lost.
3. Read the Control/Status and ID words from the Rx SMB.
4. Write Control/Status and ID words to the Rx mailbox, and update the CODE field.

The move-in process is not atomic, in such a way that it is immediately cancelled by the inactivation of the destination mailbox (see Mailbox inactivation). In this case the mailbox may remain partially updated, thus incoherent.

The BUSY Bit (least significant bit of the CODE field) of the destination message buffer is asserted while the move-in is being performed to alert the CPU that the message buffer content is temporarily incoherent.

11.8.2.6.2 Move-out

The move-out process is the copy of the content from a Tx Mailbox to the Tx SMB when a message for transmission is available (see Arbitration process). The move-out occurs in the following conditions:

- The first bit of Intermission field
- During Bus Off state when TX Error Counter is in the 124 to 128 range
- During Bus Idle state
- During Wait For Bus Idle state

The move-out process is not atomic. Only the CPU has priority to access the memory concurrently out of Bus Idle state. In Bus Idle, the move-out has the lowest priority to the concurrent memory accesses.

11.8.2.7 Data coherence

In order to maintain data coherency and FlexCAN proper operation, the CPU must obey the rules described in Transmit process and Receive process.

11.8.2.7.1 Transmission abort mechanism

The abort mechanism provides a safe way to request the abort of a pending transmission. A feedback mechanism is provided to inform the CPU if the transmission was aborted or if the frame could not be aborted and was transmitted instead.

Two primary conditions must be fulfilled in order to abort a transmission:

- MCR[AEN] must be asserted.
- The first CPU action must be the writing of abort code (1001b) into the CODE field of the Control and Status word.

Active MBs configured for transmission must be aborted first before they can be updated. If the abort code is written to a Mailbox that is currently being transmitted or to a Mailbox that was already loaded into the Tx SMB for transmission, the write operation is blocked and the transmission is not disturbed. However, the abort request is captured and kept pending until one of the following conditions is satisfied:

- The module loses the bus arbitration.
- There is an error during the transmission.
- The module is put into Freeze mode.
- The module enters Bus Off state.
- There is an overload frame.

If none of the conditions above are reached:

- The MB is transmitted correctly.
- The interrupt flag is set in the IFLAG register.
- An interrupt to the CPU is generated (if enabled).

The abort request is automatically cleared when the interrupt flag is set. On the other hand, if only one of the above conditions is reached, the frame is not transmitted; therefore:

- The abort code is written into the CODE field.
- The interrupt flag is set in the IFLAG.
- An interrupt is (optionally) generated to the CPU.

If the CPU writes the abort code before the transmission begins internally, then the write operation is not blocked; therefore, the MB is updated and the interrupt flag is set. In this way the CPU only needs to read the abort code to make sure the active MB was safely inactivated. Although the AEN bit is asserted and the CPU wrote the abort code, in this case the MB is inactivated and not aborted, because the transmission did not start yet. One Mailbox is aborted only when the abort request is captured and kept pending until one of the previous conditions is satisfied.

11.8.2.7.2 Mailbox inactivation

Inactivation is a mechanism provided to protect the mailbox against updates by the FlexCAN internal processes, thus allowing the CPU to rely on mailbox data coherence after having updated it, even in Normal mode.

Inactivation of transmission mailboxes must be performed just when MCR[AEN] is deasserted.

If a mailbox is inactivated, it participates in neither the arbitration process nor the matching process until it is reactivated. See Transmit process and Receive process for more detailed instructions on how to inactivate and reactivate a mailbox.

To inactivate a mailbox, the CPU must update its CODE field to INACTIVE (either 0b or 1000b).

Because you will not be able to synchronize the CODE field update with the FlexCAN internal processes, an inactivation can have the following consequences:

- A frame in the bus that matches the filtering of the inactivated Rx mailbox may be lost without notice, even if there are other mailboxes with the same filter.
- A frame containing the message within the inactivated Tx mailbox may be transmitted without setting the respective IFLAG.

In order to perform a safe inactivation and avoid the above consequences for Tx mailboxes, the CPU must use the transmission abort mechanism (see Transmission abort mechanism).

The inactivation automatically unlocks the mailbox (see Mailbox lock mechanism).

11.8.2.7.3 Mailbox lock mechanism

Other than mailbox inactivation, FlexCAN has another data coherence mechanism for the receive process. When the CPU reads the Control and Status word of an Rx MB with codes FULL or OVERRUN, FlexCAN assumes that the CPU wants to read the whole MB in an atomic operation, and therefore it sets an internal lock flag for that MB. The lock is released when the CPU reads the free running timer (global unlock operation), or when it reads the Control and Status word of another MB regardless of its code. A CPU write into the C/S word also unlocks the MB, but this procedure is not recommended for normal unlock use because it cancels a pending move and potentially may lose a received message. The MB locking prevents a new frame from being written into the MB while the CPU is reading it.

NOTE

The locking mechanism applies only to Rx MBs that have a code different than INACTIVE (0b) or EMPTY[1] (0100b). Also, Tx MBs cannot be locked.

Suppose, for example, that the second and the fifth MBs of the array are programmed with the same ID, and FlexCAN has already received and stored messages into these two MBs. Suppose now that the CPU decides to read MB number 5 and at the same time another message with the same ID is arriving. When the CPU reads the Control and

1. In previous FlexCAN versions, reading the C/S word locked the MB even if it was EMPTY. This behavior is maintained when the IRMQ bit is negated.

Status word of MB number 5, this MB is locked. The new message arrives and the matching algorithm finds out that there are no free-to-receive MBs, so it decides to override MB number 5. However, this MB is locked, so the new message cannot be written there. It will remain in the Rx SMB waiting for the MB to be unlocked, and only then will be written to the MB.

If the MB is not unlocked in time and yet another new message with the same ID arrives, then the new message overwrites the one on the Rx SMB and there will be no indication of lost messages either in the CODE field of the MB or in the Error and Status Register.

While the message is being moved in from the Rx SMB to the MB, the BUSY bit on the CODE field is asserted. If the CPU reads the Control and Status word and finds out that the BUSY bit is set, it should defer accessing the MB until the BUSY bit is negated.

Note

If the BUSY bit is asserted or if the MB is empty, then reading the Control and Status word does not lock the MB.

Inactivation takes precedence over locking. If the CPU inactivates a locked Rx MB, then its lock status is negated and the MB is marked as invalid for the current matching round. Any pending message on the Rx SMB will not be transferred anymore to the MB. An MB is unlocked when the CPU reads the Free Running Timer Register (see Free Running Timer (TIMER)), or the C/S word of another MB.

Lock and unlock mechanisms have the same functionality in both Normal and Freeze modes.

An unlock during Normal or Freeze mode results in the move-in of the pending message. However, the move-in is postponed if an unlock occurs during a low power mode (see Modes of operation), and it takes place only when the module returns to Normal or Freeze modes.

11.8.2.8 Rx FIFO

The Rx FIFO is receive-only and is enabled by asserting MCR[RFEN]. The reset value of this bit is zero to maintain software backward compatibility with previous versions of the module that did not have the FIFO feature.

CAUTION

Rx FIFO must not be enabled when CAN FD feature is enabled.

The FIFO is 6-message deep. The memory region occupied by the FIFO structure (both message buffers and FIFO engine) is described in Rx FIFO structure. The CPU can read the received messages sequentially, in the order they were received, by repeatedly reading a message buffer structure at the output of the FIFO.

IFLAG1[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. An interrupt is generated if it is enabled by the corresponding mask bit. Upon receiving the interrupt, the CPU can read the message (accessing the output of the FIFO as a message buffer) and the RXFIR register, and then clear the interrupt. If there are more messages in the FIFO the act of clearing the interrupt updates the output of the FIFO with the next message and updates RXFIR with the attributes of that message, reissuing the interrupt to the CPU. Otherwise, the flag remains negated. The output of the FIFO is valid only while IFLAG1[BUF5I] is asserted.

IFLAG1[BUF6I] (Rx FIFO Warning) is asserted when the number of unread messages within the Rx FIFO is increased to five from four due to the reception of a new one, meaning that the Rx FIFO is almost full. The flag remains asserted until the CPU clears it.

IFLAG1[BUF7I] (Rx FIFO Overflow) is asserted when an incoming message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. The flag remains asserted until the CPU clears it.

Clearing one of those three flags does not affect the state of the other two.

An interrupt is generated if an IFLAG bit is asserted and the corresponding mask bit is asserted too.

A powerful filtering scheme is provided to accept only frames intended for the target application, reducing the interrupt servicing workload. The filtering criteria is specified by programming a table of up to 128 32-bit registers, according to CTRL2[RFFN] setting, that can be configured to one of the following formats (see also Rx FIFO structure):

- Format A: 128 IDAFs (extended or standard IDs including IDE and RTR)
- Format B: 256 IDAFs (standard IDs or extended 14-bit ID slices including IDE and RTR)
- Format C: 512 IDAFs (standard or extended 8-bit ID slices)

Note

A chosen format is applied to all entries of the filter table. It is not possible to mix formats within the table.

Every frame available in the FIFO has a corresponding IDHIT (Identifier Acceptance Filter Hit Indicator) that can be read in the IDHIT field from C/S word, as shown in the Rx FIFO Structure description. Another way the CPU can obtain this information is by accessing the RXFIR register. RXFIR[IDHIT] refers to the message at the output of the FIFO and is valid while the IFLAG1[BUF5I] flag is asserted. The RXFIR register must be read only before clearing the flag, which guarantees that the information refers to the correct frame within the FIFO.

Up to 32 elements of the filter table are individually affected by the Individual Mask Registers (RXIMRx), according to the setting of CTRL2[RFFN], allowing very powerful filtering criteria to be defined. If MCR[IRMQ] is negated, then the FIFO filter table is affected by RXFGMASK.

NOTE

For more information about the difference between FD and non-FD regarding this feature, see Table 11-158.

11.8.2.8.1 Rx FIFO under DMA operation

The receive-only FIFO can support DMA. This feature is enabled by asserting both MCR[RFEN] and MCR[DMA]. The reset value of MCR[DMA] is zero to maintain backward compatibility with previous versions of the module that did not have the DMA feature.

The DMA controller can read the received message by reading a message buffer structure at the FIFO output port at the 80h–8Ch address range.

NOTE

FlexCAN supports 32-bit access only for DMA transfers.

When MCR[DMA] is asserted the CPU must not access the FIFO output port address range. Before enabling MCR[DMA], the CPU must service the IFLAGs asserted in the Rx FIFO region. Otherwise, these IFLAGs may show that the FIFO has data to be serviced, and mistakenly generate a DMA request. Before disabling MCR[DMA], the CPU must perform a clear FIFO operation.

IFLAG1[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. Consequently a DMA request is generated simultaneously. Upon receiving the request, the DMA controller can read the message (accessing the output of the FIFO as a message buffer). The DMA reading process must end by reading address 8Ch, which clears IFLAG1[BUF5I] and updates both the FIFO output with the next message (if FIFO is not empty) and the RXFIR register with the

attributes of the new message. If there are more messages stored in the FIFO, IFLAG1[BUF5I] will be re-asserted and another DMA request is issued. Otherwise, the flag remains negated.

IFLAG1[BUF6I] and IFLAG1[BUF7I] are not used when the DMA feature is enabled.

When FlexCAN is working with DMA, the CPU does not receive any Rx FIFO interruption and must not clear the related IFLAGs. In addition, the related IMASKs are not used to mask the generation of DMA requests.

NOTE

For more information about the difference between FD and non-FD regarding this feature, see Table 11-158.

11.8.2.8.2 Clear FIFO operation

When MCR[RFEN] is asserted, the clear FIFO operation is a feature used to empty FIFO contents. With MCR[RFEN] asserted the Clear FIFO occurs when the CPU writes one in IFLAG1[BUF0I]. This operation can only be performed in Freeze mode and is blocked by hardware in other modes. This operation does not clear the FIFO IFLAGs; consequently the CPU must service all FIFO IFLAGs before executing the clear FIFO task.

When Rx FIFO is working with DMA, the clear FIFO operation clears IFLAG1[BUF5I] and the DMA request is canceled.

CAUTION

Clear FIFO operation does not clear IFLAGs, except when MCR[DMA] is asserted; in this case only IFLAG1[BUF5I] is cleared.

11.8.2.9 CAN protocol related features

This section describes the CAN protocol related features.

11.8.2.9.1 CAN FD ISO compliance

The CAN FD protocol has been improved to increase the failure detection capability that was in the original CAN FD protocol, which is also called non-ISO CAN FD, by CAN in Automation (CiA). A three-bit stuff counter and a parity bit have been introduced in the improved CAN FD protocol, now called ISO CAN FD. The CRC calculation has also been modified. All these improvements make the ISO CAN FD protocol incompatible

with the non-FD CAN FD protocol. The non-ISO CAN FD is still supported by FlexCAN so that it can be used mainly during an intermediate phase, for evaluation and development purposes.

Therefore, it is strongly recommended to configure FlexCAN to the ISO CAN FD protocol by setting the ISOCANFDEN field in the CTRL2 register.

11.8.2.9.2 CAN FD frames

The ISO 11898-1 standard specifies the Classical Frame format compliant to ISO 11898-1 (2003) and introduces the CAN Flexible Data Rate Frame format. The Classical Frame format allows bit rates up to 1 Mbit/s and payloads up to 8 bytes per frame. The Flexible Data Rate Frame format allows bit rates higher than 1 Mbit/s and payloads longer than 8 bytes per frame. FlexCAN can receive and transmit CAN FD messages interleaved with Classical CAN messages.

There are three additional control bits in the CAN FD frame. The Extended Data Length (EDL) bit enables a longer data payload with different data length coding. The Bit Rate Switch (BRS) bit decides whether the bit rate is switched inside a CAN FD format frame. The Error State Indicator (ESI) flag is transmitted dominant by error active nodes, and recessive by error passive nodes. There are no Remote Frames (see Remote frames) in the CAN FD format. A message configured to transmit a Remote Frame is always sent out in the Classical CAN format. When an FD frame is received and matches a mailbox, the RTR bit in the receiving message buffer is negated. The RTR bit must be considered in classical frames only.

CAN FD messages may be formatted as long frames where the data field exceeds 8 bytes, and may range from 12 up to 64 bytes. They can also be configured to support bit rate switching, where the control field, the data field, and the CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame. Messages in Classical CAN format are limited to transport a maximum payload of 8 bytes at nominal rate. The following figure illustrates the message formats for Classical and FD frames with either standard or extended ID.

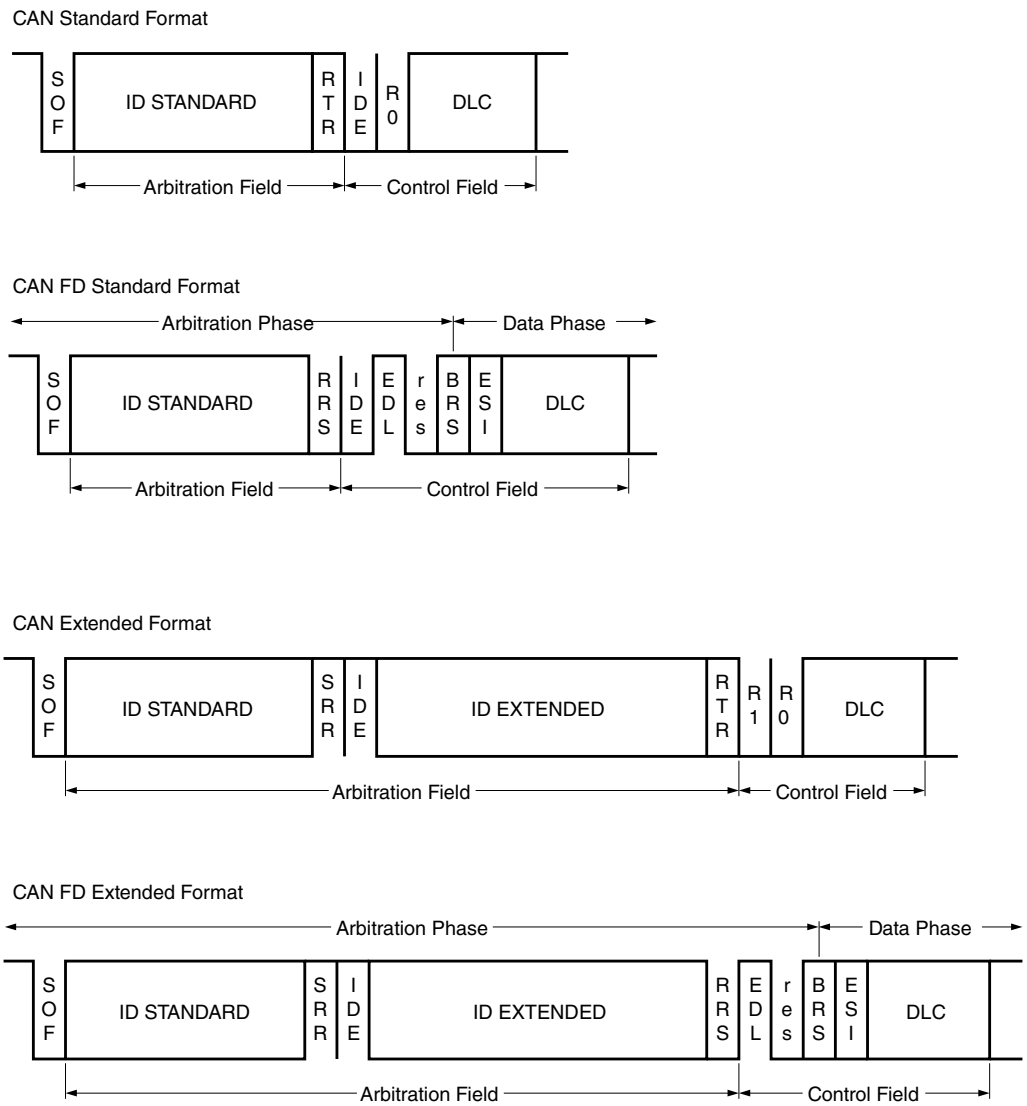

Figure 11-117. CAN message formats

The ability to receive and transmit CAN FD messages is enabled by MCR[FDEN]. Either a recessive R0 bit in CAN frames with 11-bit identifiers or a recessive R1 bit in CAN frames with 29-bit identifiers are decoded as an EDL bit (not a reserved one). A CAN FD frame is recognized by a recessive EDL bit, and a Classical CAN frame is recognized by a dominant EDL bit. The BRS bit specifies whether this frame switches the bit rate in its data phase. A long frame is decoded in accordance with the DLC field value (see DLC definition in Message buffer structure).

CAN FD messages can be transmitted with two different bit rates. The first part of a CAN FD frame, from the Start Of Frame (SOF) bit until the Bit Rate Switch (BRS) bit, also called the arbitration phase, is transmitted with the nominal bit rate based on a set of nominal CAN bit timing configuration values. The second part, from the BRS bit until the CRC Delimiter bit, also named the data phase, is transmitted with the data bit rate

defined by a second set of CAN data bit timing configuration values. Finally, from the CRC Delimiter until the Intermission bits, the transmission returns to nominal bit rate. In CAN FD frames with bit rate switching, the bit timing is changed inside the frame at the sample point of the BRS bit if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the CBT register (also by CTRL1 register for backward compatibility). Upon detecting a recessive BRS bit, the CAN data bit timing is used as defined by the FDCBT register.

NOTE

If the length of the time quantum in the nominal bit timing and the length of the time quantum in the data bit timing are not identical, a quantization error of up to one time quantum of the arbitration phase may be present as a phase error. This situation can occur after the switch from arbitration to data phase and will last until the next synchronization event. Thus, the length of the time quantum should be the same in nominal and data bit timing in order to minimize the chance of error frames on the CAN bus, and to optimize the clock tolerance in networks that use FD frames.

FDCTRL[FDRATE] enables the transmission of all frames with bit rate switching if the BRS bit in the selected Tx MB is set. If FDRATE is negated, the transmission is performed at nominal rate regardless of the BRS bit value. FDCTRL[FDRATE] can be written any time but takes effect only for the next message transmitted or received.

The nominal bit timing is resumed at either the sample point of the CRC Delimiter bit or when an error is detected, whichever occurs first. The following figure describes the mechanism for entering and leaving the data phase when BRS bit is recessive.

CAN FD Frame

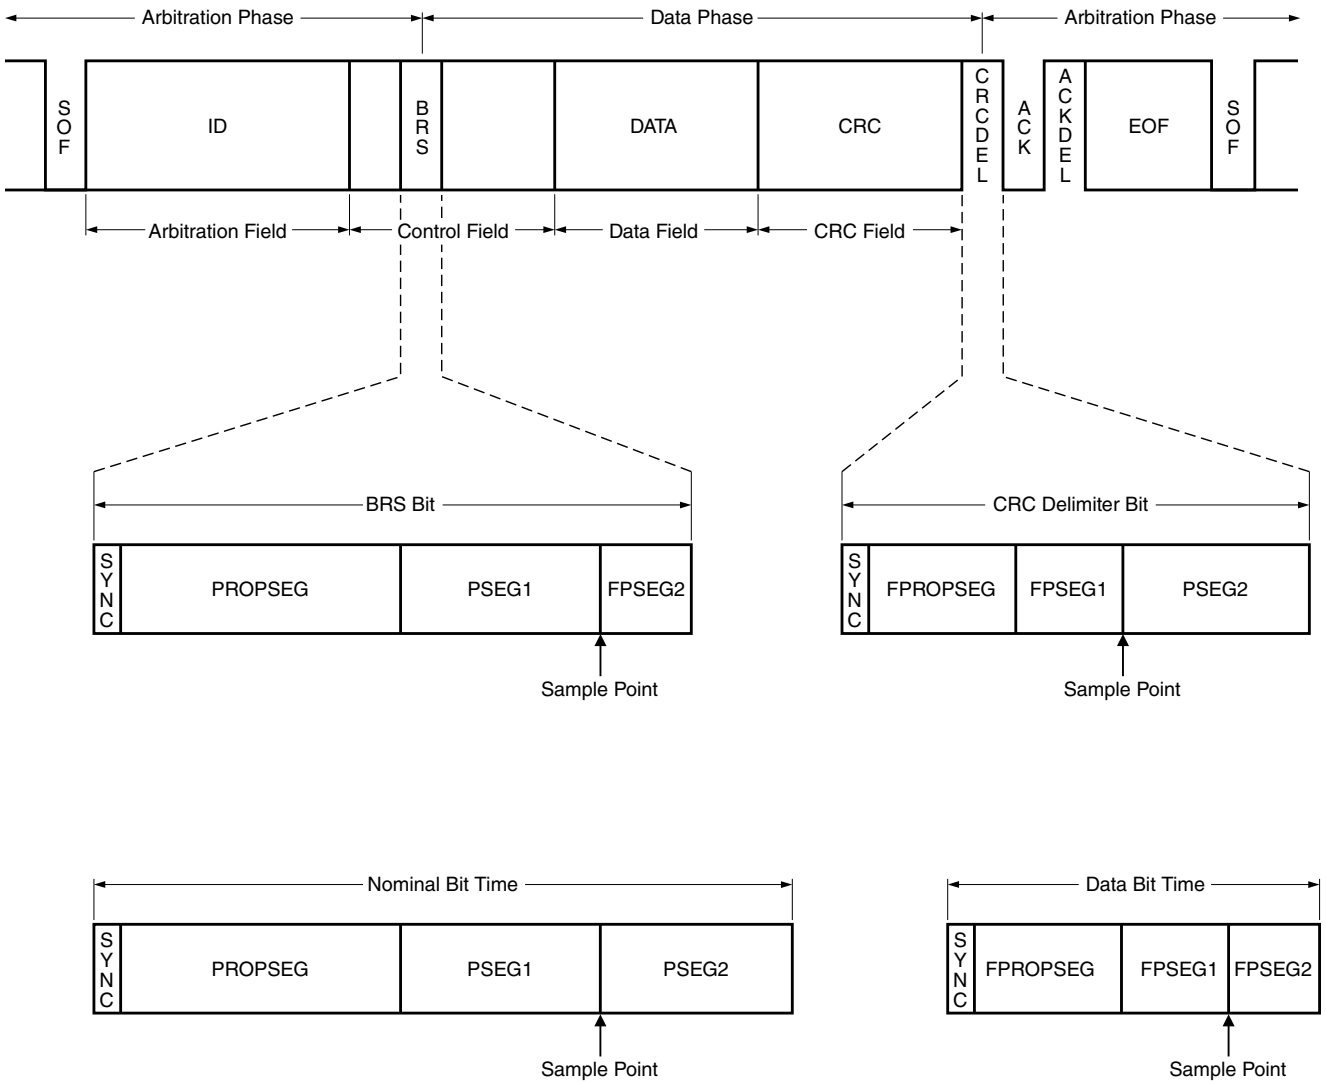

Figure 11-118. Bit rate switching mechanism for CAN FD messages

NOTE

In Classical CAN frames, the CRC delimiter is one single recessive bit. In CAN FD frames, the CRC delimiter may consist of one or two recessive bits. FlexCAN sends only one recessive bit as the CRC delimiter, but it accepts two recessive bits before the edge from recessive to dominant that starts the acknowledge slot. As a receiver, FlexCAN sends its acknowledge bit after the first CRC delimiter bit. In CAN FD frames, FlexCAN accepts a two-bit dominant ACK slot as a valid ACK to compensate for phase shifts between the receivers.

The maximum configurable bit rate in the CAN FD data phase depends on the clock frequency of CAN_PE subblock. For example, with a CAN_PE clock frequency of 40 MHz and the shortest configurable bit time of 5 time quanta, the bit rate in the data phase is 8 Mbit/s.[4]

The value of the ESI bit is determined either by the transmitter's error state at the start of the transmission, if the frame is originated in the FlexCAN node, or by the original transmitting node in case FlexCAN is acting as a gateway for the message. If the transmitter is error passive, ESI is transmitted recessive; otherwise, it is transmitted dominant. The permutations of the relationship between the written value and the transmitted value of the ESI are shown in this table.

Table 11-164. Written versus transmitted values of ESI field

FlexCAN fault confinement status at start of frame	ESI bit Of Tx MB	Transmitted ESI
Error active	0	0 (Error Active)
Error passive	0	1 (Error Passive)
Error active	1	1 (Error Passive)
Error passive	1	1 (Error Passive)

There are different CRC polynomials for different CAN frame formats. The first polynomial, CRC_15, is used for all frames in Classical CAN format. The second, CRC_17, is used for frames in CAN FD format with a data field up to sixteen bytes long. The third, CRC_21, is used for frames in CAN FD format with a data field longer than sixteen bytes. Each polynomial results in a Hamming distance of 6. At the start of the frame, all three CRC polynomials are calculated concurrently. The CRC sequence to be transmitted is selected by the values of the EDL bit and the DLC bit field. When receiving a message, FlexCAN decodes EDL and DLC to select the adequate CRC polynomial to check for a CRC error.

In CAN FD format frames, stuff bits are included in the bit stream for CRC calculation. In Classical CAN format frames, stuff bits are not included. After the transmission of the last bit relevant to the CRC calculation, the FDCRC register stores the calculated CRC for the transmitted message, with the adequate length in accordance to the type of message, for both CAN FD and non-FD messages. The CRCR register reports a valid CRC for Classical CAN messages only.

In CAN FD format frames, the CAN bit stuffing method is changed for the CRC sequence so that the stuff bits are inserted at fixed positions. When FlexCAN is transmitting a CAN FD frame, a fixed stuff bit is inserted just before the first bit of the CRC sequence, even if the last bits of the preceding field do not fulfill the CAN stuff

4. The frequency used in this example may not be supported on this chip; it is shown only to demonstrate how the maximum configurable bit rate is calculated.

condition. Additional stuff bits are inserted after each fourth bit of the CRC sequence. The value of any fixed stuff bit is the inverse value of its preceding bit. When FlexCAN is receiving a CAN FD frame, it discards the fixed stuff bits from the bit stream for the CRC check. A stuff error is detected if the fixed stuff bit has the same value as its preceding bit.

FlexCAN detects errors in CAN FD frames the same way as in Classical CAN frames. The error counters RXERRCNT and TXERRCNT in the ECR register accumulate the counts of Rx and Tx errors, respectively, for both FD and non-FD frames indiscriminately. There are two extra error counters (RXERRCNT_FAST and TXERRCNT_FAST) that accumulate Rx and Tx errors occurring in the data phase of CAN FD frames with the BRS bit set only. The rules for updating the error counters are the same for both CAN FD and non-FD frames (see ECR register).

Error Flags BITERR1, BITERR0, ACKERR, CRCERR, FRMERR, and STFERR in the ESR1 register report errors in both CAN FD and non-FD frames. They also generate the ERRINT interrupt if CTRL1[ERRMSK] is asserted. The ESR1 register has additional error flags (BITERR1_FAST, BITERR0_FAST, CRCERR_FAST, FRMERR_FAST, and STFERR_FAST) to individually indicate the occurrence of errors in the data phase of CAN FD frames with the BRS bit set. There is no ACKERR detected in the data phase of a CAN FD frame. Fault confinement status reported in ESR1[FLTCONF] is the same for both CAN FD and Classical CAN frames, and is based on RXERRCNT and TXERRCNT error counters only. Information contained in RXERRCNT_FAST and TXERRCNT_FAST counters may be considered as status to help detect the error nature related to the bit rate value.

When FlexCAN is in the data phase, either transmitting or receiving a CAN FD message, and detects an error, it immediately switches back to the arbitration phase and to the nominal rate to start an error flag.

Resynchronization and hard synchronization occur in CAN FD frames in the same way as in Classical CAN ones. Additionally, a hard synchronization is also performed at the recessive to dominant edge from EDL to R0 in CAN FD format frames. FlexCAN does not resynchronize while transmitting in the CAN FD data phase.

11.8.2.9.3 Transceiver delay compensation

The CAN FD protocol allows the transmission and reception of data at a higher bit rate than the nominal rate used in the arbitration phase when the message's BRS bit is set. This feature enables the use of rates up to 8 Mbps.

During the data phase of a CAN FD frame, the transmitter detects a bit error if it cannot receive its own latest transmitted bit at the sample point of that bit. When bit rate switching is enabled (BRS bit is asserted), the length of the CAN bit time in the data

phase can become shorter than the transceiver's loop delay, thus impeding the correct comparison between the transmitted bit and the received bit within the current CAN bit time interval.

Note that the TDC process defines a secondary sample point where the transmitted bit is correctly compared with the received bit in order to check for bit errors.

The TDC mechanism can be enabled by FDCTRL[TDCEN] and is effective only during the data phase of FD frames having the BRS bit set. It has no effect either on non-FD frames, or on FD frames transmitted at normal bit rate. The TDC is active from the sample point of the BRS bit until the sample point of the CRC Delimiter bit, provided the respective message under transmission has the BRS bit set. When it is active, a comparison is done between the real received bit and the delayed transmitted bit, where the delay is calculated based on the measured transceiver loop delay.

NOTE

The actual value of the CRC Delimiter bit is disregarded by transmitters using the transceiver delay compensation mechanism. A global error at the end of the CRC field will cause the receivers to send error frames that the transmitter will detect during Acknowledge or End of Frame.

For every transmitted FD frame having the BRS bit set, the delay measurement is triggered by the transition from the recessive EDL bit to the dominant R0 bit (as shown in the next figure). The loop delay is measured in Protocol Engine (PE) clock periods (CANCLK, see Protocol timing), from the transmitted EDL-R0 edge to the received EDL-R0 edge. The position of the secondary sample point is defined by the measured loop delay time added to an offset value specified in FDCTRL[TDCOFF]. FDCTRL[TDCVAL] stores the result of this calculation. The TDCVAL value saturates at its maximum value of 63 CANCLK when the delay measurement is too long.

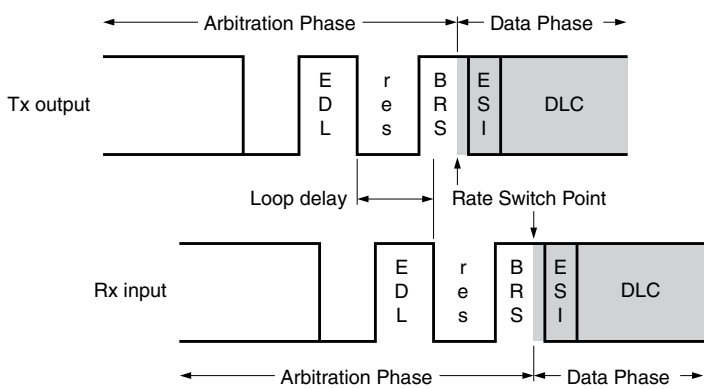

Figure 11-119. Transceiver loop delay measurement

The measured loop delay is not enough to be used to define the secondary sample point because it relates to the CAN bit edges. The transceiver delay compensation offset TDCOFF is used to shift the secondary sample point from the edge to an intermediate point inside the bit time, far away from its edges. Therefore, the TDCOFF value cannot be larger than the CAN bit duration in the data phase.

If the secondary sample point is set very near the CAN bit edge (SYNC field), then problems may occur during the bit sampling in the data phase. For the TDC to work reliably, the offset has to use optimal settings. To be sure the bit sampling is performed in the best region, the TDC offset should be configured as shown in this equation:

$$Offset = (FPSEG1 + FPROPSEG + 2) \times (FPRESDIV + 1)$$

The following figure shows the SSP position when these settings are used.

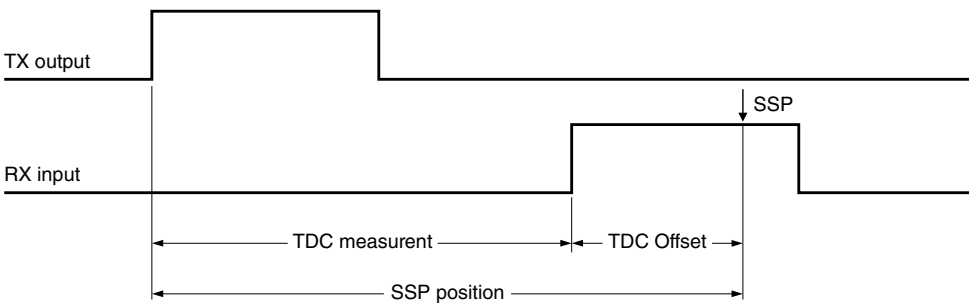

Figure 11-120. SSP position with optimal values

During the data phase of CAN FD frames with bit rate switching enabled, at the onset of every Tx CAN bit, the transmitted Tx bit value is temporarily stored in a buffer and a time countdown based on FDCTRL[TDCVAL] is started which ends with the comparison of the received Rx bit (delayed by the external loop delay plus the specified offset) with the stored Tx bit. If a bit error is detected at the secondary sample point, the FlexCAN issues an error flag to the CAN bus at the next sample point.

During the arbitration phase the delay compensation is always disabled. The maximum delay which can be compensated by the FlexCAN's transceiver delay compensation during the data phase is 3 CAN bit times – 2 Tq. Beyond this limit, the FDCTRL[TDCFAIL] flag is set to indicate when the transceiver delay compensation mechanism is out of range, unable to compensate the transceiver loop delay.

11.8.2.9.4 Remote frames

A remote frame is a special kind of frame. You can program a mailbox to be a remote request frame by configuring the mailbox as Transmit with the RTR bit set to one. After the remote request frame is transmitted successfully, the mailbox becomes a receive message buffer, with the same ID as before.

When a remote request frame is received by FlexCAN, it can be treated in three ways, depending on remote request storing (CTRL2[RRS]) and Rx FIFO Enable (MCR[RFEN]):

- If RRS is negated the frame's ID is compared to the IDs of the transmit message buffers with the CODE field 1010b. If there is a matching ID, then this mailbox frame will be transmitted. Note that if the matching mailbox has the RTR bit set, then FlexCAN will transmit a remote frame as a response. The received remote request frame is not stored in a receive buffer. It is only used to trigger a transmission of a frame in response. The mask registers are not used in remote frame matching, and all ID bits (except RTR) of the incoming received frame should match. In the case that a remote request frame is received and matches a mailbox, this message buffer immediately enters the internal arbitration process, but is considered as a normal Tx mailbox, with no higher priority. The data length of this frame is independent of the DLC field in the remote frame that initiated its transmission.
- If RRS is asserted the frame's ID is compared to the IDs of the receive mailboxes with the CODE field 0100b, 0010b, or 0110b. If there is a matching ID, then this mailbox will store the remote frame in the same fashion of a data frame. No automatic remote response frame will be generated. The mask registers are used in the matching process.
- If RFEN is asserted FlexCAN will not generate an automatic response for remote request frames that match the FIFO filtering criteria. If the remote frame matches one of the target IDs, it will be stored in the FIFO and presented to the CPU. Note that for filtering formats A and B, it is possible to select whether remote frames are accepted or not. For format C, remote frames are always accepted (if they match the ID). Remote request frames are considered as normal frames, and generate a FIFO overflow when a successful reception occurs and the FIFO is already full.

NOTE

There is no remote frame in the CAN FD format. The RTR bit is replaced by a fixed dominant RRS bit. FlexCAN receives and transmits remote frames in the Classical CAN format.

11.8.2.9.5 Overload frames

FlexCAN does transmit overload frames when the following conditions are detected on the CAN bus:

- Detection of a dominant bit in the first/second bit of Intermission
- Detection of a dominant bit at the 7th bit (last) of End of Frame field (Rx frames)
- Detection of a dominant bit at the 8th bit (last) of Error Frame Delimiter or Overload Frame Delimiter

11.8.2.9.6 Time stamp

The value of the free running timer is sampled at the beginning of the Identifier field on the CAN bus, and is stored at the end of move-in in the TIME STAMP field, providing network behavior with respect to time.

The free running timer is clocked by the FlexCAN bit-clock, which defines the baud rate on the CAN bus. During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate.

The free running timer is not incremented during Disable, Doze, Stop, and Freeze modes. It can be reset upon a specific frame reception, enabling network time synchronization. See the TSYN description in Control 1 register (CTRL1).

11.8.2.9.7 Protocol timing

The following figure shows the structure of the clock generation circuitry that feeds the CAN Protocol Engine (PE) submodule. The clock source field CTRL1[CLKSRC] defines whether the internal clock is connected to the output of a crystal oscillator (oscillator clock) or to the peripheral clock. In order to guarantee reliable operation, the clock source should be selected when the module is in Disable mode (MCR[MDIS] is set).

NOTE

Please see the clock distribution chapter (module clocks table) to identify the proper clock source.

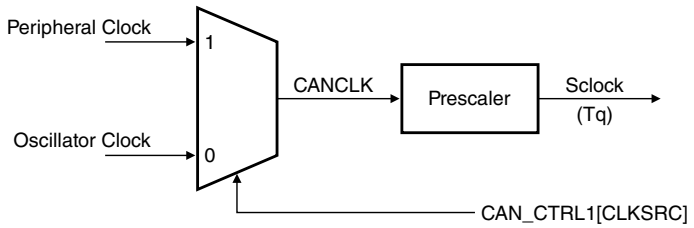

Figure 11-121. CAN engine clocking scheme

The oscillator clock should be selected whenever a tight tolerance (up to 0.1%) is required in the CAN bus timing. The crystal oscillator clock has better jitter performance than the peripheral clock.

The FlexCAN module supports a variety of means to set up bit timing parameters that are required by the CAN protocol. The Control 1 register (CTRL1) has various fields used to control bit timing parameters: PRESDIV, PROPSEG, PSEG1, PSEG2, and RJW.

The CAN Bit Timing register (CBT) extends the range of the CAN bit timing variables in CTRL1. The CAN FD Bit Timing register (FDCBT) provides a second set of CAN bit timing variables to be applied at the data phase of CAN FD frames with the Bit Rate Switch (BRS) set.

NOTE

When the CAN FD feature is enabled, always set CBT[BTF] and configure the CAN bit timing variables in CBT. See CAN Bit Timing Register (CBT).

The PRESDIV field (as well as its extended range EPRESDIV and FDPRESDIV for the data phase bits of CAN FD messages) defines the prescaler value (see the equation below) that generates the serial clock (Sclock), whose period defines the time quantum used to compose the CAN waveform. A time quantum (Tq) is the atomic unit of time managed by the CAN engine.

$$Tq = \frac{(PRESDIV + 1)}{f_{CANCLK}}$$

Figure 11-122. Time quantum

The bit rate, which defines the rate the CAN message is either received or transmitted, is given by the formula:

$$\text{CAN Bit Time} = (\text{Number of Time Quanta in 1 bit time}) * Tq$$

$$\text{Bit Rate} = \frac{1}{\text{CAN Bit Time}}$$

Figure 11-123. CAN bit time and baud rate

A bit time is subdivided into three segments[1] (see Figure 11-124, Figure 11-125 and Table 11-165):

- SYNC_SEG: This segment has a fixed length of one time quantum. Signal edges are expected to happen within this section.
- Time Segment 1: This segment includes the propagation segment and the phase segment 1 of the CAN standard. It can be programmed by setting CTRL1[PROPSEG] and CTRL1[PSEG1] so that their sum (plus 2) is in the range of 2 to 16 time quanta. When CBT[BTF] is asserted, FlexCAN uses EPROPSEG and EPSEG1 fields from CBT register so that their sum (plus 2) is in the range of 2 to 96 time quanta. For messages in CAN FD format with the BRS bit set, FlexCAN uses FDPROPSEG and FDPSEG1 from FDCBT instead, so that their sum (plus 1) is in the range of 2 to 39 time quanta.
- Time Segment 2: This segment represents the phase segment 2 of the CAN standard. It can be programmed by setting CTRL1[PSEG2] (plus 1) to be 2 to 8 time quanta long. When CBT[BTF] is asserted, FlexCAN uses EPSEG2 fields of CBT register so that its value (plus 1) is in the range of 2 to 32 time quanta. For messages in CAN FD format with the BRS bit set, FlexCAN uses FDPSEG2 from FDCBT instead, so that its value (plus 1) is in the range of 2 to 8 time quanta. The time segment 2 cannot be smaller than the Information Processing Time (IPT), which value is 2 time quanta in FlexCAN.

NOTE

The bit time defined by the above time segments must not be smaller than five time quanta. For bit time calculations, use an Information Processing Time (IPT) of two, which is the value implemented in the FlexCAN module.

1. For further explanation of the underlying concepts, see ISO 11898-1. See also the CAN 2.0A/B protocol specification for bit timing.

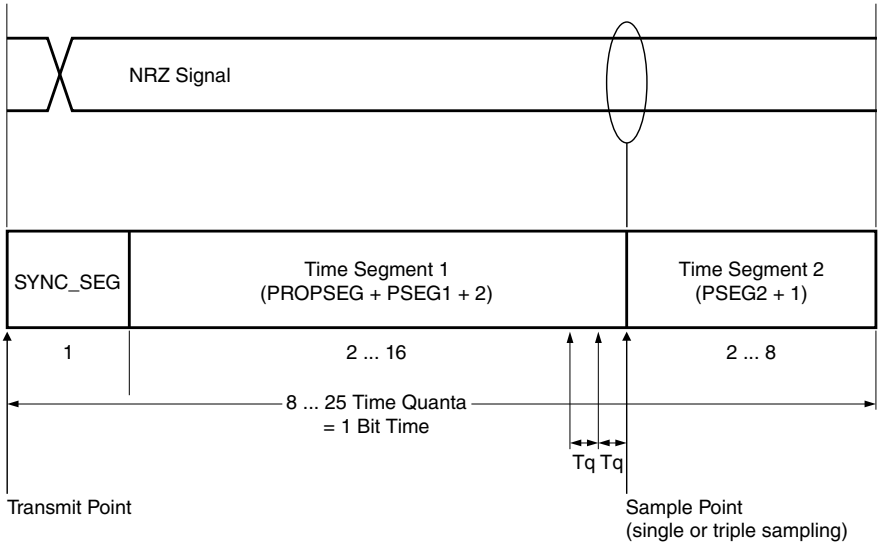

Figure 11-124. Segments within the bit time (example using CTRL1 bit timing variables for Classical CAN format)

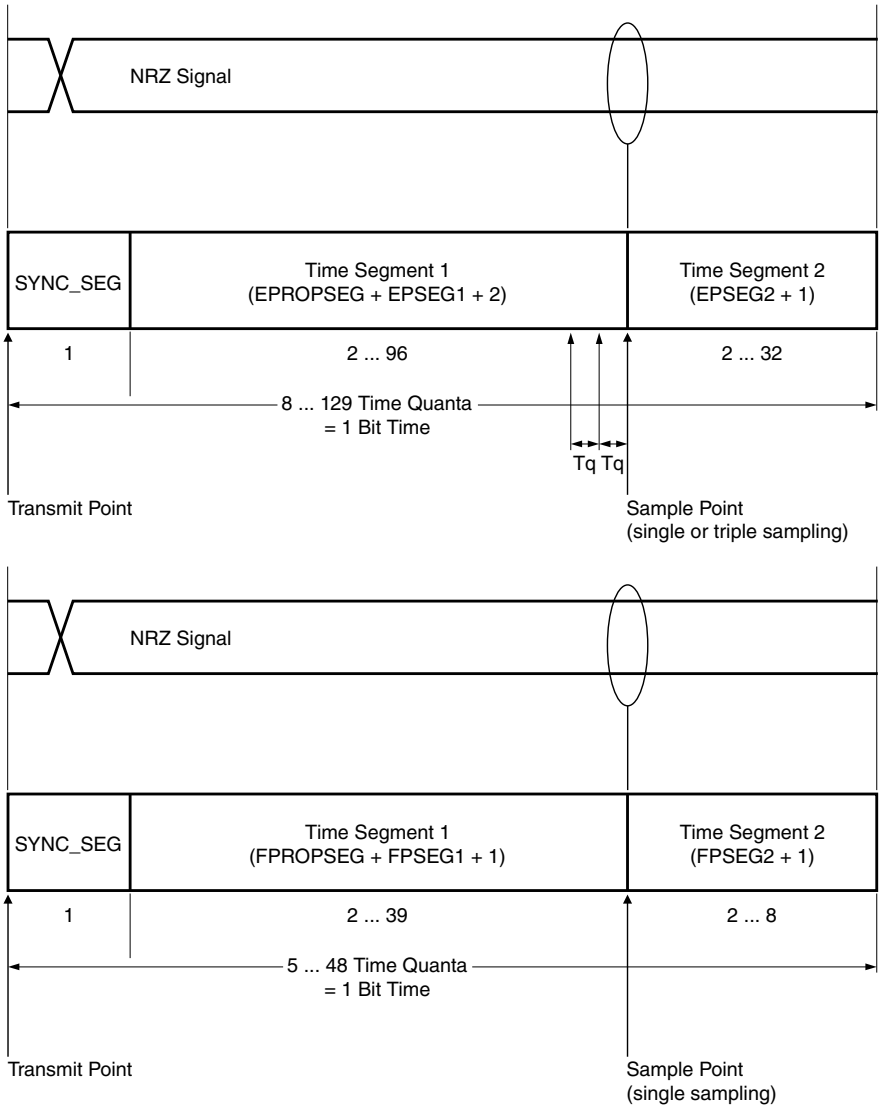

Figure 11-125. Segments within the bit time (example using CBT and FDCBT bit timing variables for CAN FD format)

Table 11-165. Time segment syntax

Syntax	Description
SYNC_SEG	System expects transitions to occur on the bus during this period.
TSEG1	Corresponds to the sum of PROPSEG and PSEG1.
TSEG2	Corresponds to the PSEG2 value.
Transmit point	A node in transmit mode transfers a new value to the CAN bus at this point.
Sample point	A node samples the bus at this point. If the three samples per bit option is selected, then this point marks the position of the third sample.

The following table gives some examples of the CAN compliant segment settings for Classical CAN format (Bosch CAN 2.0B) (non-FD) messages.

Table 11-166. Bosch CAN 2.0B standard compliant bit time segment settings

Time segment 1	Time segment 2	Re-synchronization jump width
5 .. 10	2	1 .. 2
4 .. 11	3	1 .. 3
5 .. 12	4	1 .. 4
6 .. 13	5	1 .. 4
7 .. 14	6	1 .. 4
8 .. 15	7	1 .. 4
9 .. 16	8	1 .. 4

Note

The user must ensure the bit time settings are in compliance with the CAN Protocol standard (ISO 11898-1).

Whenever CAN bit is used as a measure of time duration (for example, estimating the occurrence of a CAN bit event in a message), the number of peripheral clocks in one CAN bit (NumClkBit) can be calculated as:

$$\text{NumClkBit} = \frac{f_{SYS}}{f_{CANCLK}} \times (\text{PRESDIV} + 1) \times (\text{PROPSEG} + \text{PSEG1} + \text{PSEG2} + 4)$$

Figure 11-126. Number of peripheral clocks per CAN bit when CTRL2[BTE] = 0

where:

- NumClkBit is the number of peripheral clocks in one CAN bit.
- f_{CANCLK} is the Protocol Engine (PE) Clock (see Figure 11-121), in Hz.
- f_{SYS} is the frequency of operation of the system (CHI) clock, in Hz.
- PSEG1 is the value in CTRL1[PSEG1] field.
- PSEG2 is the value in CTRL1[PSEG2] field.
- PROPSEG is the value in CTRL1[PROPSEG] field.
- PRESDIV is the value in CTRL1[PRESDIV] field.

The formula above is also applicable to the alternative CAN bit timing variables described in the CAN Bit Timing register (CBT) and also to the CAN FD Bit Timing register (FDCBT).

For example, 180 CAN bits = (180 x NumClkBit) peripheral clock periods.

11.8.2.9.8 Arbitration and matching timing

During normal reception and transmission, the matching, arbitration, move-in, and move-out processes are executed during certain time windows inside the CAN frame, as shown in the following figures.

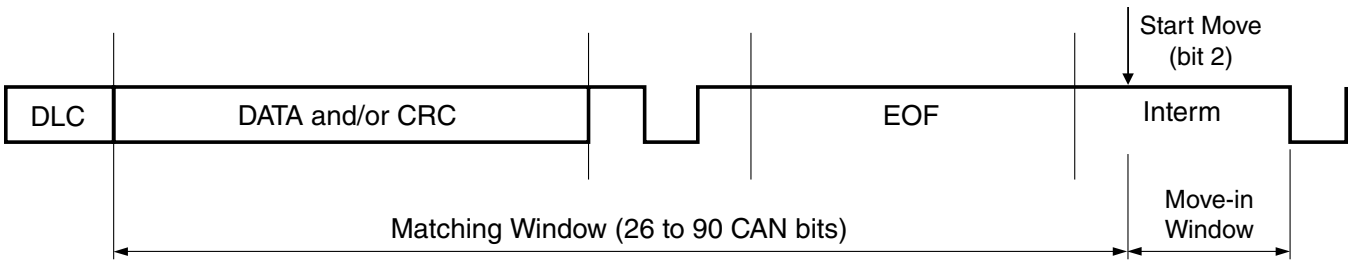

Figure 11-127. Matching and move-in time windows

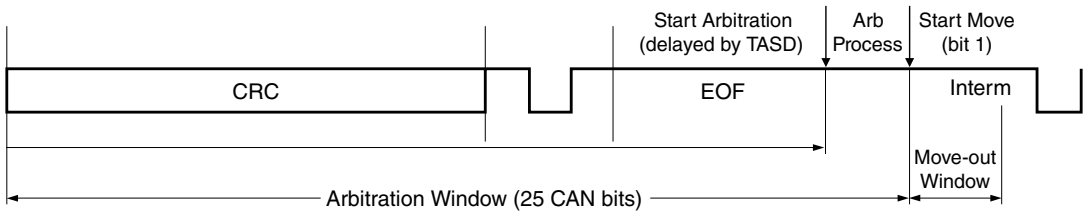

Figure 11-128. Arbitration and move-out time windows

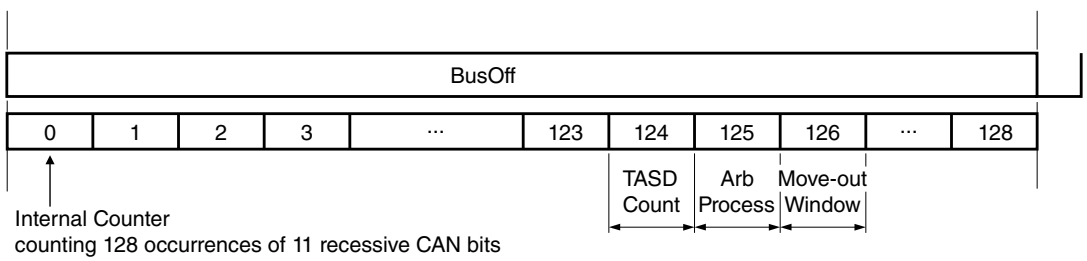

Figure 11-129. Arbitration at the end of bus off and move-out time windows

NOTE

In the preceding figures, the matching and arbitration timing does not take into account the delay caused by the concurrent memory access due to the CPU or other internal FlexCAN subblocks.

11.8.2.9.9 Tx arbitration start delay

CTRL2[TASD] (Tx Arbitration Start Delay) is a variable that indicates the number of CAN bits used by FlexCAN to delay the Tx arbitration process start point from the first bit of CRC field of the current frame. This variable can be written only in Freeze mode because it is blocked by hardware in other modes.

The transmission performance is impacted by the ability of the CPU to reconfigure message buffers (MBs) for transmission after the end of the internal arbitration process, where FlexCAN finds the winner MB for transmission (see Arbitration process). If the arbitration ends too early before the first bit of Intermission field, then there is a chance that the CPU reconfigures some Tx MBs and the winner MB is no longer the best candidate to be transmitted.

TASD is useful to optimize the transmission performance by defining the arbitration start point, as shown in the next figure, based on factors such as:

- Peripheral-to-oscillator clock ratio
- CAN bit timing variables that determine the CAN bit rate
- Number of message buffers (MBs) in use by the matching and arbitration processes

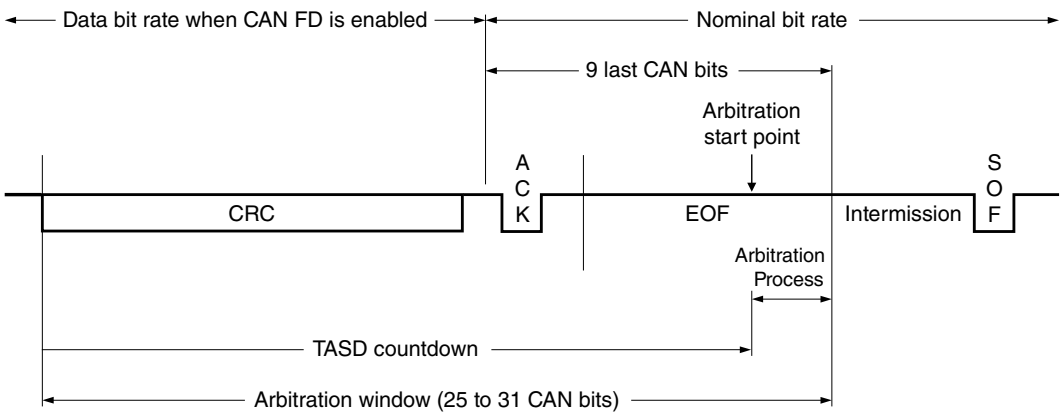

Figure 11-130. Optimal Tx Arbitration start point

The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and to the CAN bit rate, and inversely proportional to the peripheral clock frequency.

The optimal arbitration timing is that in which the last MB is scanned just before the first bit of the Intermission field of a CAN frame. For instance, if there are few MBs and the peripheral/oscillator clock ratio is high and the CAN baud rate is low, then the arbitration can be placed closer to the frame's end, adding more delay to its start point, and vice-versa.

If TASD is set to 0 then the arbitration start is not delayed and more time is reserved for arbitration. On the other hand, if TASD is close to 24 then the CPU can configure a Tx MB later and less time is reserved for arbitration. If too little time is reserved for arbitration the FlexCAN may be not be able to find a winner MB in time to be transmitted with the best chance to win the bus arbitration against external nodes on the CAN bus.

The optimal TASD value can be calculated as follows:

For CAN FD frames and (MAXMB + 1) ≤ NMB_{END}

$$TASD = 31 - \frac{2 * (MAXMB + 1) + 4}{CPCB_N}$$

For CAN FD frames and (MAXMB + 1) > NMB_{END}

$$TASD = 22 - \frac{2 * (MAXMB + 1) - NMB_{END}}{CPCB_F}$$

For non-FD frames

$$TASD = 25 - \frac{2 * (MAXMB + 1) + 4}{CPCB}$$

Figure 11-131. Optimal value for TASD

where:

$$NMB_{END} = \frac{(9 * CPCB_N) - 4}{2}$$

$$BITRATE_N = \left(\frac{f_{CANCLK}}{[1 + (EPSEG1 + 1) + (EPSEG2 + 1) + (EPROPSEG + 1)] \times (EPRESDIV + 1)} \right)$$

$$BITRATE_F = \left(\frac{f_{CANCLK}}{[1 + (FPSEG1 + 1) + (FPSEG2 + 1) + FPROPSEG] \times (FPRESDIV + 1)} \right)$$

$$CPCB_N = \frac{f_{SYS}}{BITRATE_N}$$

$$CPCB_F = \frac{f_{SYS}}{BITRATE_F}$$

$$CPCB = CPCB_N$$

Figure 11-132. Variables used in TASD calculation

- MAXMB is the value in CTRL1[MAXMB].
- NMB_{END} is the number of message buffers that can be scanned by the arbitration process during the 9 last CAN bits at the end of a frame (see the figure above).
- $BITRATE_N$ is the CAN bit rate in bits per second calculated by the nominal CAN bit time variables.
- $BITRATE_F$ is the CAN bit rate in bits per second calculated by the data CAN bit time variables.
- $CPCB_N$ is the number of peripheral clocks per CAN bit in nominal bit rate for CAN FD frames.
- $CPCB_F$ is the number of peripheral clocks per CAN bit in data bit rate for CAN FD frames.
- CPCB is the number of peripheral clocks per CAN bit for non-FD frames.
- f_{CANCLK} is the oscillator clock, in Hz.
- f_{SYS} is the peripheral clock, in Hz.
- EPSEG1 is the value in CBT[EPSEG1] (CTRL1[PSEG1] can also be used).

- EPSEG2 is the value in CBT[EPSEG2] (CTRL1[PSEG2] can also be used).
- EPROPSEG is the value in CBT[EPROPSEG] (CTRL1[PROPSEG] can also be used).
- EPRESDIV is the value in CBT[EPRESDIV] (CTRL1[PRESDIV] can also be used).
- FPSEG1 is the value in FDCBT[FPSEG1].
- FPSEG2 is the value in FDCBT[FPSEG2].
- FPROPSEG is the value in FDCBT[FPROPSEG].
- FPRESDIV is the value in FDCBT[FPRESDIV].

See also Protocol timing for more details.

The following tables give the TASD value calculated for some configuration cases.

Case 1:

- Clock ratio = 2:1 (example: peripheral clock 80 MHz and oscillator clock 40 MHz)
- Bit rate in arbitration phase = 1 Mbaud

Table 11-167. TASD values:

Number of message buffers	TASD value	Maximum bit rate in data phase (MBd)
16	24	Invalid
32	24	8.0
64	23	8.0

Case 2:

- Clock ratio = 1:1 (example: peripheral clock 40 MHz and oscillator clock 40 MHz)
- Bit rate in arbitration phase = 1 Mbaud

Table 11-168. TASD values:

Number of message buffers	TASD value	Maximum bit rate in data phase (MBd)
16	24	Invalid
32	23	6.67
54	22	5.0
64	21	3.33

Case 3:

- Clock ratio = 2:1 (example: peripheral clock 40 MHz and oscillator clock 20 MHz)
- Bit rate in arbitration phase = 1 Mbaud

Table 11-169. TASD values:

Number of message buffers	TASD value	Maximum bit rate in data phase (MBd)
16	24	Invalid
32	23	4.0
54	22	4.0
64	21	3.33

11.8.2.10 Clocks

The following table describes the clock sources for FlexCAN. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 11-170. FlexCAN clocks

Clock name	Description
ipg_clk	Peripheral clock
ipg_clk_chi	Control Host Interface (CHI) clock
ipg_clk_pe	Protocol Engine (PE) clock
ipg_clk_pe_nogate	Protocol Engine clock (no gating)
ipg_clk_s	Peripheral access clock

11.8.2.10.1 Clock domains and restrictions

The FlexCAN module has two clock domains asynchronous to each other:

- The bus domain feeds the Control Host Interface (CHI) submodule.
- The oscillator domain feeds the CAN Protocol Engine (PE) submodule.

When CTRL1[CLKSRC] is set, synchronous operation occurs because both domains are connected to the peripheral clock (creating a 1:1 ratio between the peripheral and oscillator clocks).

When the two domains are connected to clocks with different frequencies and/or phases, there are restrictions on the frequency relationship between the two clock domains. In the case of asynchronous operation, the bus domain clock frequency must always be greater than the oscillator domain clock frequency.

NOTE

Asynchronous operation with a 1:1 ratio between peripheral and oscillator clocks is not allowed.

When doing matching and arbitration, FlexCAN needs to scan the whole message buffer memory during the time slot of one CAN frame, comprised of a number of CAN bits. In order to have sufficient time to do that, the following requirements must be observed:

- The peripheral clock frequency cannot be smaller than the oscillator clock frequency.
- There must be a minimum number of peripheral clocks per CAN bit, as specified in the table shown below.

Table 11-171. Minimum number of peripheral clocks per CAN bit for Classical CAN format

Number of mailboxes	Value of MCR[RFEN]	Minimum number of peripheral clocks per CAN bit
16	0	16
32	0	16
64	0	25
16	1	16
32	1	17
64	1	30

For classical frame format, the minimum number of peripheral clocks per CAN bit specified in the preceding table determines the minimum peripheral clock frequency for a given number of mailboxes and for an expected CAN bit rate. The CAN bit rate depends on the number of time quanta in a CAN bit, which can be defined by adjusting one or more of the bit timing values contained in either the Control 1 register (CTRL1) or CAN Bit Time register (CBT). The time quantum (Tq) is defined in Protocol timing. The minimum number of time quanta per CAN bit must be 8; therefore, the oscillator clock frequency should be at least 8 times the CAN bit rate.

For CAN FD frame format, there are some constraints that need to be satisfied. The number of peripheral clocks per CAN bit in nominal bit rate (NumClkNomBit) can be calculated by the equation below.

$$\text{NumClkNomBit} = \frac{f_{SYS}}{f_{CANCLK}} \times (\text{PRESDIV} + 1) \times (\text{PROPSEG} + \text{PSEG1} + \text{PSEG2} + 4)$$

$$= \frac{f_{SYS}}{\text{NomBitRate}}$$

Figure 11-133. Number of peripheral clocks per nominal CAN bit

where PRESDIV, PSEG1, and PSEG2 are CAN bit time values in CTRL1 register. Alternatively, EPRESDIV, EPSEG1, and EPSEG2 values in CBT register can be used instead. NumClkNomBit can also be calculated as a function of the expected nominal bit rate used in the arbitration phase (NomBitRate), as shown in the equation above.

The number of CAN bits in the data phase of an FD frame with the BRS bit set (fast CAN bits, in short) depends on the number of data bytes in the payload. The number of fast CAN bits (NumOfFastBits) can be determined in the table below. The fewer the number of data bytes, the fewer the number of fast CAN bits, and less time is available for FlexCAN to scan the whole message buffer memory during the internal matching and arbitration processes.

Table 11-172. Number of fast CAN bits in a CAN FD frame

Minimum number of data bytes	DLC field	NumOfFastBits
0	0h	21
1	1h	29
2	2h	37
3	3h	45
4	4h	53
5	5h	61
6	6h	69
7	7h	77
8	8h	85
12	9h	117
16	Ah	149
20	Bh	186
24	Ch	218
32	Dh	282
48	Eh	410
64	Fh	538

The critical part of a CAN FD frame is during the data phase, where the CAN bit rate is faster than in the arbitration phase. The minimum number of peripheral clocks per fast CAN bit (MinNumClkFastBit) can be calculated to guarantee that enough time is available for FlexCAN to scan the message buffer memory during reception and transmission. The equation below calculates this constraint.

$$\text{MinNumClkFastBit}_A = \frac{(8.5 \times \text{MaxNumOfMb}) + 64 - (9 \times \text{NumClkNomBit})}{\text{NumOfFastBits}}$$

Figure 11-134. Minimum number of peripheral clocks per fast CAN bit for FlexCAN scan process

where MaxNumOfMb is the maximum number of available mailboxes defined in MCR[MAXMB].

The clock domain crossing circuit between the CHI and PE subblocks also imposes a minimum number of peripheral clocks per fast CAN bit for the handshake mechanism to work properly without losing status information through the interface, as shown in the equation below.

$$MinNumClkFastBit_B = 3 \times \left(1 + \frac{f_{SYS}}{f_{CANCLK}}\right)$$

Figure 11-135. Minimum number of peripheral clocks per fast CAN bit for FlexCAN clock domain interface

Therefore, the minimum number of peripheral clocks per fast CAN bit (MinNumClkFastBit) is determined by the larger of the two values calculated above.

$$MinNumClkFastBit = Maximum\ (\ MinNumClkFastBit_A, MinNumClkFastBit_B\ )$$

Figure 11-136. Minimum number of peripheral clocks per fast CAN bit

Then, the maximum CAN bit rate in the data phase of CAN FD frames (DataBitRateMAX) can be calculated as below.

$$DataBitrate_{MAX} = \frac{f_{CANCLK}}{ROUNDUP\left(\frac{MinNumClkFastBit \times f_{CANCLK}}{f_{SYS}}\right)}$$

Figure 11-137. Maximum achievable baud rate for data phase

The peripheral and oscillator clock frequencies, the maximum number of mailboxes, and the expected nominal bit rate affect the maximum data bit rate attainable by FlexCAN in CAN FD mode. Also, the data bit rate depends on the minimum payload size of FD frames used in a given application.

To illustrate how the CAN FD bit rate is affected by the configuration of FlexCAN variables, an application example with the peripheral and oscillator clock frequencies set to 50 MHz and 40 MHz, respectively, is considered.

1. Considering the nominal bit rate as 1 Mbps, the number of peripheral clocks per CAN bit in nominal bit rate is calculated as below.

$$NumClkNomBit = \frac{50 \times 10^6}{1 \times 10^6} = 50$$

Figure 11-138. Calculation example for number of peripheral clocks per nominal CAN bit

2. The number of fast CAN bits (NumOfFastBits) is determined in the table presented above. For example, if the minimum payload in FD frames is 8 bytes, then there are 85 CAN bits in the data phase.
3. Assuming the maximum number of mailboxes is 96, the minimum number of peripheral clocks per fast CAN bit (MinNumClkFastBit) can be calculated.

$$\text{MinNumClkFastBit}_A = \frac{(8.5 \times 96) + 64 - (9 \times 50)}{85} = 5.06$$

Figure 11-139. Calculation example for number of peripheral clocks per fast CAN bit for FlexCAN scan process

$$\text{MinNumClkFastBit}_B = 3 \times \left(1 + \frac{50}{40}\right) = 6.75$$

Figure 11-140. Calculation example for number of peripheral clocks per fast CAN bit for FlexCAN clock domain interface

$$\text{MinNumClkFastBit} = \text{Maximum}\ (5.06, 6.75) = 6.75$$

Figure 11-141. Calculation example for number of peripheral clocks per fast CAN bit

4. The maximum CAN bit rate in the data phase can finally be found.

$$\text{DataBitRate}_{MAX} = \frac{40 \times 10^6}{\text{ROUNDUP}\left(\frac{6.75 \times 40 \times 10^6}{50 \times 10^6}\right)} = 6.667\ \text{Mbps}$$

Figure 11-142. Calculation example for maximum achievable baud rate

As demonstrated in this example, even though the oscillator clock frequency (40 MHz) is adequate to generate a data rate of 8 Mbps in CAN FD mode, the specific FlexCAN configuration limits this rate to 6.667 Mbps. This limitation is mainly due to the low peripheral clock frequency that imposes the MinNumClkFastBitB bound.

The table below shows the maximum data rate for CAN FD according to clock frequencies, payload size, and number of available mailboxes. See in this table that, for some cases, if the number of available mailboxes is reduced, the FlexCAN can then achieve a data rate up to 8 Mbps.

Table 11-173. Maximum CAN bit rate in data phase on CAN FD frames

Peripheral clock frequency (MHz)	Payload size	Number of available mailboxes	Maximum data rate (Mbps)
40	8	94	6.667
40	8	114	5.0
40	12	117	6.667
40	12	128	5.714
50	12 to 64	128	6.667
60	8	126	8.0
60	12	128	8.0
67	6	128	8.0
80	3	128	8.0
100	0	128	8.0

11.8.2.11 Reset

You can reset FlexCAN in the following ways:

1. Chip level hard reset, which resets all memory-mapped registers asynchronously.
2. MCR[SOFTRST], which resets some of the memory-mapped registers synchronously. See Table 11-176 to see what registers are affected by soft reset.

Soft reset is synchronous and has to follow an internal request/acknowledge procedure across clock domains. Therefore, it may take some time to fully propagate its effects. MCR[SOFTRST] remains asserted while soft reset is pending, so software can poll this bit to know when the reset has completed. Also, soft reset cannot be applied while clocks are shut down in a low-power mode. The low-power mode should be exited and the clocks resumed before applying soft reset.

The clock source should be selected when the module is in Disable mode (see CTRL1[CLKSRC] description in Control 1 Register (CTRL1)). After the clock source is selected and the module is enabled (MCR[MDIS] bit negated), FlexCAN automatically enters Freeze mode. In Freeze mode, FlexCAN is un-synchronized to the CAN bus, MCR[HALT] and MCR[FRZ] are set, the internal state machines are disabled, then MCR[FRZACK] and MCR[NOTRDY] are set. The Tx pin is in recessive state and FlexCAN does not initiate any transmission or reception of CAN frames. Note that the message buffers and the Rx Individual Mask registers are not affected by reset, so they are not automatically initialized.

11.8.2.12 Interrupts

The module has many interrupt sources: interrupts due to message buffers and interrupts due to the ORed interrupts from MBs, Bus Off, Bus Off Done, Error, Error Fast (errors detected in the data phase of CAN FD format messages with the BRS bit set), Wake Up, Tx Warning, and Rx Warning.

Each one of the message buffers can be an interrupt source, if its corresponding IMASK bit is set. There is no distinction between Tx and Rx interrupts for a particular buffer, under the assumption that the buffer is initialized for either transmission or reception. Each of the buffers has an assigned flag bit in the IFLAG registers. The bit is set when the corresponding buffer completes a successful transfer and is cleared when the CPU writes one to it (unless another interrupt is generated at the same time).

Note

It must be guaranteed that the CPU clears only the bit causing the current interrupt. For this reason, bit manipulation

instructions (BSET) must not be used to clear interrupt flags. These instructions may cause accidental clearing of interrupt flags which are set after entering the current interrupt service routine.

If the Rx FIFO is enabled (MCR[RFEN] = 1) and DMA is disabled (MCR[DMA] = 0), the interrupts corresponding to MBs 0 to 7 have different meanings. Bit 7 of the IFLAG1 register becomes the "FIFO Overflow" flag; bit 6 becomes the "FIFO Warning" flag, bit 5 becomes the "Frames Available in FIFO" flag and bits 4-0 are unused. See the description of Interrupt Flags 1 Register (IFLAG1) for more information.

If both Rx FIFO and DMA are enabled (MCR[RFEN] and MCR[DMA] = 1) the FlexCAN does not generate any FIFO interrupt. Bit 5 of the IFLAG1 register still indicates "Frames Available in FIFO" and generates a DMA request. Bits 7, 6, 4-0 are unused.

CAUTION

FIFO cannot be enabled when CAN FD feature is enabled.

For a combined interrupt where multiple MB interrupt sources are OR'd together, the interrupt is generated when any of the associated MBs (or FIFO, if applicable) generates an interrupt. In this case, the CPU must read the IFLAG registers to determine which MB or FIFO source caused the interrupt.

The following interrupt sources generate interrupts like the MB interrupt sources, and can be read from ESR1 register

- Bus Off
- Bus Off Done
- Error
- Error Fast
- Wake Up
- Tx Warning
- Rx Warning

The Bus Off, Error, Tx Warning, and Rx Warning interrupt mask bits are located in the CTRL1 register; the Wake-Up interrupt mask bit is located in MCR.

11.8.2.13 Bus interface

CPU access to FlexCAN registers is subject to the following rules:

- Unrestricted read and write access to supervisor registers (registers identified with S/U in Table 11-176 in Supervisor Mode or with S only) results in an access error.

- Read and write access to implemented reserved address space results in an access error.
- Write access to positions whose bits are all currently read-only results in an access error. If at least one of the bits is not read-only then no access error is issued. Write permission to positions or some of their bits can change depending on the mode of operation or transitory state. See register and field descriptions for details.
- Read and write access to unimplemented address space results in access error.
- Read and write access to RAM located positions during Low Power mode results in an access error.
- It is possible for the RXIMR memory region to be considered as general purpose memory and available for access. There are two ways of doing this:
  a. If MCR[IRMQ] is cleared, the individual masks (RXIMR) are disabled. In this case the RXIMR memory region is considered as general purpose memory.
  b. If MCR[MAXMB] is programmed with a value smaller than the available number of MBs, then the unused memory space can be used as general purpose RAM space. Note that reserved words within RAM cannot be used. As an example, suppose FlexCAN's RAM can support up to 16 MBs, CTRL2[RFFN] is 0h, and MCR[MAXMB] is programmed with zero. The maximum number of MBs in this case becomes one. The RAM starts at 0080h, and the space 0080h–008Fh is used by the one MB. The memory space 0090h–017Fh is available. The space 0180h–087Fh is reserved. The space 0880h–0883h is used by the one individual mask and the available memory in the mask registers space would be 0884h–08BFh. From 08C0h–09DFh there are reserved words for internal use which cannot be used as general purpose RAM. As a general rule, free memory space for general purpose depends only on MAXMB.
  c. If MCR[FDEN] is enabled, general purpose memory can be used out of Freeze mode only.

Table 11-174. Access permissions

1. Access in low power is only possible if RAM_clk and ipg_clk are enabled.
2. If MCR[RFEN] = 1, see FIFO access rules below.
3. Write operation has no effect.

11.8.2.14 Detection and correction of memory errors

NOTE

All FlexCAN memory must be initialized before starting its operation in order to have the parity bits in memory properly updated. CTRL2[WRMFRZ] grants write access to all memory positions that require initialization, ranging from 080h–ADFh and from F28h–FFFh when the CAN FD feature is enabled. The RXMGMASK, RX14MASK, RX15MASK, and RXFGMASK registers need to be initialized as well. MCR[RFEN] must not be set during memory initialization.

FlexCAN supports detection and correction of errors in memory read accesses. Each byte of FlexCAN memory is associated to five parity bits that ensure a Hamming distance of four. The error correction mechanism ensures that in this 13-bit word, errors in one bit can be corrected (correctable errors) and errors in two bits can be detected but not corrected (non-correctable errors). Errors in more than two bits may not be detected. In

case of non-correctable errors, the corrupted data is not changed by the error correction logic. When a read access is performed, the parity bits are used to calculate a syndrome, which indicates the error in each byte.

FlexCAN detects a noncorrectable error in the event either an all-zeros or an all-ones read occurs. See description of Error Report Syndrome Register (RERRSYNR).

Memory errors are indicated to the host through status register (Error Status Register (ERRSR)) and bus transfer errors, and reported through report registers (Error Report Address register (RERRAR), Error Report Data register (RERRDR) and Error Report Syndrome register (RERRSYNR)).

The error detection and correction mechanism can be activated or not, controlled by MECR[ECCDIS]. When disabled, updates on indications and reporting registers are stopped, but the parity bits are still calculated and written along with data in memory write operations to ensure that memory has consistent parity bits associated with the data.

To avoid accidentally changing the critical error correction configuration, this protocol must be followed to enable the update of the Memory Error Control register (MECR):

1. By default, CTRL2[ECRWRE] is zero and MECR[ECRWRDIS] is one.
2. Set CTRL2[ECRWRE].
3. Clear MECR[ECRWRDIS].
4. All writes to Memory Error Control register (MECR) must keep MECR[ECRWRDIS] cleared.
5. After configuration is done, lock the Memory Error Control register (MECR) by either setting MECR[ECRWRDIS] or clearing CTRL2[ECRWRE].

11.8.2.14.1 Sources of the memory access

The FlexCAN memory can be accessed by two major sources (or requestors):

- Host (CPU): the largest word accessed is 32-bit.
- FlexCAN internal processes (Rx matching, Tx arbitration, move-in on reception, move-out on transmission): the largest word accessed is 64-bit.

The way that noncorrectable errors are indicated and reported depends on the source of access.

11.8.2.14.2 Error indication

Memory errors are indicated by flags HANCEIF, FANCEIF, and CEIF in the Error Status Register (ERRSR). Noncorrectable errors detected in memory reads requested by the host are indicated separately than the ones detected in requests by FlexCAN internal processes. FlexCAN makes no distinction of the source of the access when correctable

errors are detected. There are three independent flags for these three cases, and each flag will raise an interrupt unless it is masked by mask bits in Memory Error Control Register (MECR). If both noncorrectable and correctable errors are found in different bytes in the same read operation, both flags are set.

A noncorrectable error detected in host access is also indicated as a bus transfer error. A bus wait request may be asserted to extend the memory transaction to the moment the report registers are updated. This indication cannot be masked. If the flag bit ERRSR[HANCEIF] is not masked, the same noncorrectable error will raise a bus transfer error and an interrupt request.

Each indication flag has one overrun flag in Error Status Register (ERRSR). The overrun flags do not request interrupts. Overrun flags for noncorrectable errors indicate that other errors of the same nature were detected after current error being treated; overrun flags for correctable errors indicate that other errors of the same nature were detected before the current error being treated.

This is the recommended handling sequence for error indication:

1. Get error report information from report registers.
2. Use this information to take proper measures in the application.
3. Clear the HANCEIF, FANCEIF, and CEIF flags.
4. If the overrun flag is active:
    a. Alert application that at least one error could not be managed.
    b. Clear the overrun flag.

The FlexCAN internal processes can access memory in transactions larger than 32 bits. For the indication, this kind of access is considered a consecutive sequence of 32-bit accesses. If errors are found in two or more 32-bit words the interrupt and overrun flags are set simultaneously.

11.8.2.14.3 Error reporting

The report registers Error Report Address register (RERRAR), Error Report Data register (RERRDR), and Error Report Syndrome register (RERRSYNR) provide detailed information about the address read, raw data, and syndrome read with error, and are indicated by the flags described in Error indication. The address, data, and syndrome registers are updated simultaneously along with the error flags, according to these rules:

1. If either of the two non-correctable error flags is currently set, the report registers are not updated (the previous non-correctable error reporting is preserved).
2. Otherwise (either no error flag is currently set or only the correctable error flag is currently set), the report registers are updated according to the new error; or

according to the most severe of new errors if non-correctable and correctable errors are simultaneously detected.

Reporting of errors detected in accesses larger than 32-bit follows the rules described in Error indication and in the description of Error Report Address Register (RERRAR).

The address reported in RERRAR and defined in ERRIAR are not the same listed in the module memory map. The relation between the reported addresses and the respective ones in the module memory map is shown in the description of Error Injection Address Register (ERRIAR).

Addresses reported when reading memory portions organized as FIFOs, such as the Rx FIFO Structure and the Rx FIFO Information Register (RXFIR), refer to the address of the specific entry accessed in the FIFO, not to the FIFO base address.

To assure coherence of the error report registers it is necessary to turn off the report update by setting MECR[RERRDIS] before reading the report registers.

11.8.2.14.4 Response to errors

Correctable errors have no consequence on FlexCAN operation because affected data is corrected before its use by the host or FlexCAN internal processes.

For host-initiated reads, a noncorrectable error may affect the host, but does not affect FlexCAN operation.

Non-correctable errors detected on memory reads requested by the FlexCAN internal processes may result in incorrect operation depending on the state of MECR[NCEFAFRZ], as follows:

- During reception (either matching or move-in processes), when a noncorrectable error occurs, an incorrect destination may be selected to store the incoming frame, a corrupted frame may be stored in the correct destination, or both. If MECR[NCEFAFRZ] is set, FlexCAN stops operation automatically and enters in Freeze mode to prevent corrupted data from being treated as valid by FlexCAN internal processes. When MECR[NCEFAFRZ] is negated, FlexCAN continues working and a corrupted frame is received.
- During arbitration process, when a noncorrectable error occurs, either a non-highest priority Tx message buffer may be mistakenly selected for transmission or its data may be corrupted. If MECR[NCEFAFRZ] is set, FlexCAN stops operation automatically and enters Freeze mode before starting the move-out. When MECR[NCEFAFRZ] is negated, FlexCAN proceeds to move-out with a corrupted frame that will be transmitted on the CAN bus.
- During move-out process, when a noncorrectable error occurs, a corrupted frame is copied from the selected Tx MB that won the arbitration to the Tx SMB for

transmission. If MECR[NCEFAFRZ] is set, FlexCAN stops operation automatically and enters Freeze mode before starting the transmission. When MECR[NCEFAFRZ] is negated, the corrupted frame is transferred from the Tx SMB to the Protocol Engine (PE) sub-block and is transmitted on the CAN bus.

- A noncorrectable error can also be detected beyond the move-out process, when Tx data is read from Tx SMB (buffer located in RAM) to be transferred to the PE subblock for transmission. In this case, a frame with corrupted ID and/or data is transmitted on the CAN bus.

  To prevent the frame from being successfully received by the external nodes, FlexCAN inverts all bits in the CRC field (CRC sequence plus CRC delimiter), and transmits an error flag just after CRC delimiter as a result of self-detecting a Bit1 error and a form error due to the CRC field inversion. When MECR[NCEFAFRZ] is set, FlexCAN stops operation automatically and enters Freeze mode just after the error frame. When MECR[NCEFAFRZ] is negated, FlexCAN may attempt to re-transmit the same frame, as long as no other higher priority Tx MB is subsequently configured for transmission.

  In the event the noncorrectable error persists, FlexCAN eventually reaches the Bus Off state because of consecutive error detections. ECR[TXERRCNT] is updated every time FlexCAN inverts the CRC field, causing errors as described above.

When MECR[NCEFAFRZ] is set and FlexCAN enters Freeze mode, only the CPU can cause FlexCAN to exit Freeze mode and resume Normal mode. The assertion of MECR[NCEFAFRZ] is the only way to prevent corrupted frames from being transmitted on the CAN bus up to the move-out internal process.

The error report registers can provide information to the application for customized management of these situations.

11.8.2.14.5 Error injection

The error injection registers ERRIAR, ERRIDPR, and ERRIPPR are used to inject errors in memory reads in order to force errors and consequently update the indication and reporting registers. The relation between the error injection addresses and the respective ones in the module memory map is shown in the description of Error Injection Address Register (ERRIAR).

The injection is done by flipping the data and parity bits correspondent to the bits in 1 in ERRIDPR and ERRIPPR. Injection can be selected specifically for memory accesses requested by the host or by FlexCAN internal processes.

In case of accesses larger than 32-bits, the EXTERRIE bit in Memory Error Control register (MECR) extends the injection pattern, replicating it in 32-bit words to fill the width of the access.

NOTE

It is very unlikely, but error injection may correct a bit with error. This will not raise the error flags and reports as expected.

To ensure coherence among error injection registers and avoid spurious error injections, MECR[HAERRIE] and MECR[FAERRIE] must be cleared when configuring the memory injection registers.

11.8.3 FlexCAN signal descriptions

The FlexCAN module has two I/O signals connected to the external chip pins. These signals are summarized in the following table and described in more detail in the next subsections.

Table 11-175. FlexCAN signal descriptions

Signal	Description	I/O
CAN Rx	CAN receive pin	Input
CAN Tx	CAN transmit pin	Output

11.8.3.1 CAN Rx

This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level 0. Recessive state is represented by logic level 1.

11.8.3.2 CAN Tx

This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level 0. Recessive state is represented by logic level 1.

11.8.4 Initialization/application information

This section provides instructions for initializing the FlexCAN module.

11.8.4.1 FlexCAN initialization sequence

For any configuration change/initialization it is required that FlexCAN be put into Freeze mode (see Freeze mode). Note that the module needs to be initialized after every reset.

The following is a generic initialization sequence applicable to the FlexCAN module:

1. Initialize the Module Configuration register (MCR).
   a. Enable the individual filtering per MB and reception queue features by setting IRMQ.
   b. Enable the warning interrupts by setting WRNEN.
   c. If required, disable frame self reception by setting SRXDIS.
   d. Enable the Rx FIFO by setting RFEN.
   e. If Rx FIFO is enabled and DMA is required, set DMA.
   f. Enable the abort mechanism by setting AEN.
   g. Enable the local priority feature by setting LPRIOEN.
2. Initialize the Control 1 register (CTRL1) and optionally the CAN Bit Timing register (CBT). Initialize also the CAN FD CAN Bit Timing register (FDCBT).
   a. Determine the bit timing parameters: PROPSEG, PSEG1, PSEG2, and RJW.
   b. Optionally determine the bit timing parameters: EPROPSEG, EPSEG1, EPSEG2, and ERJW.
   c. Determine the CAN FD bit timing parameters: FPROPSEG, FPSEG1, FPSEG2, and FRJW.
   d. Determine the bit rate by programming the PRESDIV field and optionally the EPRESDIV field.
   e. Determine the CAN FD bit rate by programming the FPRESDIV field.
   f. Determine the internal arbitration mode (LBUF).
3. All FlexCAN memory must be initialized if Error Code Correction (ECC) is enabled. See Detection and correction of memory errors.
4. Initialize the message buffers.
   a. The control and status word of all message buffers must be initialized.
   b. If Rx FIFO was enabled, the ID filter table must be initialized.
   c. Other entries in each message buffer should be initialized as required.
5. Initialize the Rx Individual Mask registers (RXIMRn).
6. Set required interrupt mask bits in
   - IMASK registers (for all MB interrupts)
   - MCR register (for Wake-Up interrupt)
   - CTRL1 / CTRL2 registers (for Bus Off and Error interrupts)
7. Negate MCR[HALT].

After the last step listed above, FlexCAN attempts to synchronize to the CAN bus.

11.8.5 Memory map/register definition

This section describes the registers and data structures in the FlexCAN module. The base address of the module depends on the particular memory map of the chip.

11.8.5.1 FlexCAN memory mapping

The address space occupied by FlexCAN has 128 bytes for registers starting at the module base address, followed by embedded RAM starting at address offset 0080h.

Each individual register is identified by its complete name and the corresponding mnemonic . The access type can be Supervisor (S) or Unrestricted (U). Most of the registers can be configured to have either Supervisor or Unrestricted access by programming MCR[SUPV]. These registers are identified as S/U in the Access column of Table 11-176.

NOTE

An invalid register access will result in a bus error. This includes reading a write-only register, writing a read-only register, or accessing an invalid address.

Table 11-176. Register access and reset information

Register	Access type	Affected by hard reset	Affected by soft reset
Module Configuration Register (MCR)	S	Yes	Yes
Control 1 Register (CTRL1)	S/U	Yes	No
Free Running Timer Register (TIMER)	S/U	Yes	Yes
Rx Mailboxes Global Mask Register (RXMGMASK)	S/U	No	No
Rx Buffer 14 Mask Register (RX14MASK)	S/U	No	No
Rx Buffer 15 Mask Register (RX15MASK)	S/U	No	No
Error Counter Register (ECR)	S/U	Yes	Yes
Error and Status 1 Register (ESR1)	S/U	Yes	Yes
Interrupt Masks 2 Register (IMASK2)	S/U	Yes	Yes
Interrupt Masks 1 Register (IMASK1)	S/U	Yes	Yes
Interrupt Flags 2 Register (IFLAG2)	S/U	Yes	Yes
Interrupt Flags 1 Register (IFLAG1)	S/U	Yes	Yes
Control 2 Register (CTRL2)	S/U	Yes	No
Error and Status 2 Register (ESR2)	S/U	Yes	Yes
CRC Register (CRCR)	S/U	Yes	Yes
Rx FIFO Global Mask Register (RXFGMASK)	S/U	No	No

Table continues on the next page...

Table 11-176. Register access and reset information (continued)

Register	Access type	Affected by hard reset	Affected by soft reset
Rx FIFO Information Register (RXFIR)	S/U	No	No
CAN Bit Timing Register (CBT)	S/U	Yes	No
Message buffers	S/U	No	No
Rx Individual Mask Registers	S/U	No	No
Memory Error Control Register (MECR)	S/U	Yes	Yes
Error Injection Address Register (ERRIAR)	S/U	Yes	Yes
Error Injection Data Pattern Register (ERRIDPR)	S/U	Yes	Yes
Error Injection Parity Pattern Register (ERRIPPR)	S/U	Yes	Yes
Error Report Address Register (RERRAR)	S/U	Yes	Yes
Error Report Data Register (RERRDR)	S/U	Yes	Yes
Error Report Syndrome Register (RERRSYNR)	S/U	Yes	Yes
Error Status Register (ERRSR)	S/U	Yes	Yes
CAN FD Control Register (FDCTRL)	S/U	Yes	No
CAN FD Bit Timing Register (FDCBT)	S/U	Yes	No
CAN FD CRC Register (FDCRC)	S/U	Yes	Yes

The FlexCAN module can store CAN messages for transmission and reception using mailboxes and Rx FIFO structures.

11.8.5.2 CAN register descriptions

The table below shows the FlexCAN memory map.

The address range from offset 80h–47Fh allocates the sixty-four 128-bit message buffers (MBs).

The memory maps for the message buffers are in FlexCAN message buffer memory map.

11.8.5.2.1 CAN memory map

CAN1 base address: 308C_0000h

CAN2 base address: 308D_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h	Module Configuration Register (MCR)	32	RW	5980_000Fh

Table continues on the next page...

Offset	Register	Width (In bits)	Access	Reset value
4h	Control 1 Register (CTRL1)	32	RW	0000_0000h
8h	Free Running Timer (TIMER)	32	RW	0000_0000h
10h	Rx Mailboxes Global Mask Register (RXMGMASK)	32	RW	Table 11-176
14h	Rx 14 Mask Register (RX14MASK)	32	RW	Table 11-176
18h	Rx 15 Mask Register (RX15MASK)	32	RW	Table 11-176
1Ch	Error Counter (ECR)	32	RW	0000_0000h
20h	Error and Status 1 Register (ESR1)	32	R2C	0000_0000h
24h	Interrupt Masks 2 Register (IMASK2)	32	RW	0000_0000h
28h	Interrupt Masks 1 Register (IMASK1)	32	RW	0000_0000h
2Ch	Interrupt Flags 2 Register (IFLAG2)	32	W1C	0000_0000h
30h	Interrupt Flags 1 Register (IFLAG1)	32	W1C	0000_0000h
34h	Control 2 Register (CTRL2)	32	RW	0080_0000h

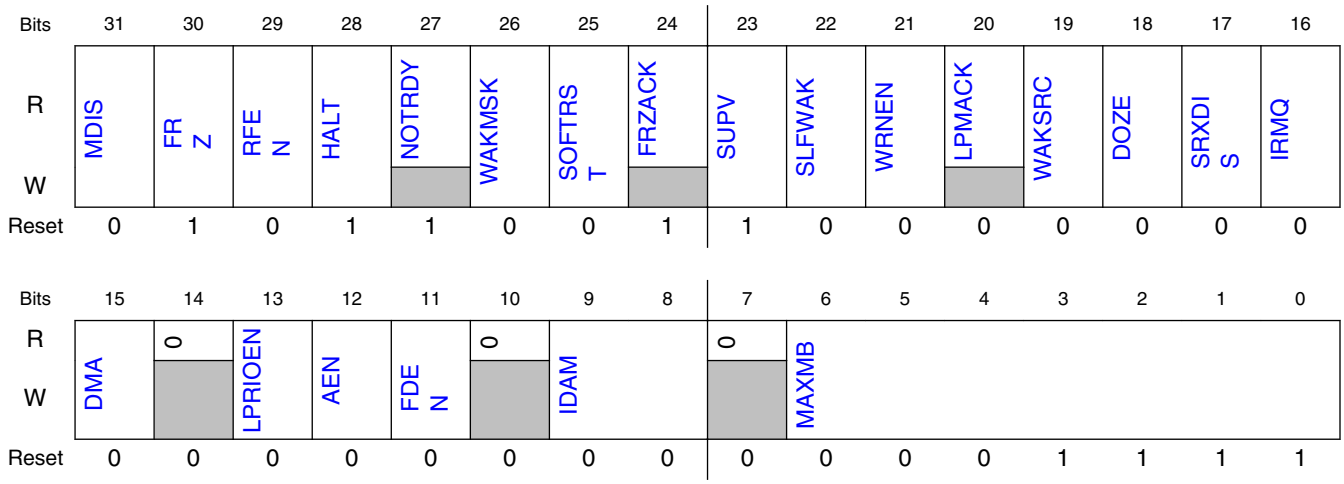
11.8.5.2.2 Module Configuration Register (MCR)



11.8.5.2.2.1 Offset

Register	Offset
MCR	0h

11.8.5.2.2.2 Function

This register defines global system configurations, such as the module operation modes and the maximum message buffer configuration.

11.8.5.2.2.3 Diagram

11.8.5.2.2.4 Fields

Field	Function
31 MDIS	Module Disable This bit controls whether FlexCAN is enabled or not. When disabled, FlexCAN disables the clocks to the CAN Protocol Engine and Controller Host Interface submodules. This bit is not affected by soft reset. 0b - Enable the FlexCAN module. 1b - Disable the FlexCAN module.
30 FRZ	Freeze Enable The FRZ bit specifies the FlexCAN behavior when MCR[HALT] is set or when Debug mode is requested at chip level. When FRZ is asserted, FlexCAN is enabled to enter Freeze mode. Negation of this bit field causes FlexCAN to exit from Freeze mode. This bit is set by hardware when a non-correctable error is detected (MECR[NCEFAFRZ] is asserted). 0b - Not enabled to enter Freeze mode. 1b - Enabled to enter Freeze mode.
29 RFEN	Rx FIFO Enable This bit controls whether the Rx FIFO feature is enabled or not. When RFEN is set, MBs 0 to 5 cannot be used for normal reception and transmission because the corresponding memory region (80h–DCh) is used by the FIFO engine as well as additional MBs (up to 32, depending on CTRL2[RFFN] setting) which are used as Rx FIFO ID filter table elements. RFEN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 11-171. This bit can be written in Freeze mode only, because it is blocked by hardware in other modes. **NOTE:** This bit cannot be set when CAN FD operation is enabled (see FDEN bit). 0b - Rx FIFO not enabled. 1b - Rx FIFO enabled.
28	Halt FlexCAN

Table continues on the next page...

Field	Function
HALT	Assertion of this bit puts the FlexCAN module into Freeze mode. The CPU should clear it after initializing the message buffers and the Control registers CTRL1 and CTRL2. No reception or transmission is performed by FlexCAN before this bit is cleared. Freeze mode cannot be entered when FlexCAN is in a low power mode. The HALT bit is set by hardware when a non-correctable error is detected and MECR[NCEFAFRZ] is asserted. 0b - No Freeze mode request. 1b - Enters Freeze mode if the FRZ bit is asserted.
27 NOTRDY	FlexCAN Not Ready This read-only bit indicates that FlexCAN is either in Disable mode, Doze mode, Stop mode or Freeze mode. It is negated when FlexCAN has exited these modes. This bit is not affected by soft reset. 0b - FlexCAN module is either in Normal mode, Listen-Only mode, or Loop-Back mode. 1b - FlexCAN module is either in Disable mode, Doze mode, Stop mode, or Freeze mode.
26 WAKMSK	Wake Up Interrupt Mask This bit enables the Wake Up interrupt generation under Self Wake Up mechanism. 0b - Wake Up interrupt is disabled. 1b - Wake Up interrupt is enabled.
25 SOFTRST	Soft Reset When SOFTRST is asserted, FlexCAN resets its internal state machines and some of the memory-mapped registers. SOFTRST can be asserted directly by the CPU when it writes to the MCR register. Because soft reset is synchronous and has to follow a request/acknowledge procedure across clock domains, it may take some time to fully propagate its effect. The SOFTRST bit remains asserted when reset is pending, and is automatically negated when reset completes. Therefore, software can poll this bit to know when the soft reset has completed. Soft reset cannot be applied when clocks are shut down in a low power mode. The module should be first removed from low power mode, and then soft reset can be applied. This bit is not affected by soft reset. 0b - No reset request. 1b - Resets the registers affected by soft reset.
24 FRZACK	Freeze Mode Acknowledge This read-only bit indicates that FlexCAN is in Freeze mode and its prescaler is stopped. The Freeze mode request cannot be granted until current transmission or reception processes have finished. Therefore the software can poll the FRZACK bit to know when FlexCAN has actually entered Freeze mode. If Freeze mode request is negated, then this bit is negated after the FlexCAN prescaler is running again. If Freeze mode is requested when FlexCAN is in a low power mode, then the FRZACK bit will be set only when the low-power mode is exited. See Freeze mode. This bit is not affected by soft reset. **NOTE:** FRZACK will be asserted within 178 CAN bits from the Freeze mode request by the CPU, and negated within 2 CAN bits after the Freeze mode request removal (see Protocol timing). 0b - FlexCAN not in Freeze mode, prescaler running. 1b - FlexCAN in Freeze mode, prescaler stopped.
23 SUPV	Supervisor Mode This bit configures the FlexCAN to be either in Supervisor or User mode. The registers affected by this bit are marked as S/U in the "Access type" column of Table 11-176. Reset value of this bit is 1, so the affected registers start with Supervisor access allowance only. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0b - FlexCAN is in User mode. Affected registers allow both Supervisor and Unrestricted accesses. 1b - FlexCAN is in Supervisor mode. Affected registers allow only Supervisor access. Unrestricted access behaves as though the access was done to an unimplemented register location.
22 SLFWAK	Self Wake Up

Table continues on the next page...

Field	Function
	This bit enables the Self Wake Up feature when FlexCAN is in a low-power mode other than Disable mode. When this feature is enabled, the FlexCAN module monitors the bus for wakeup event, that is, a recessive-to-dominant transition. If a wakeup event is detected during Doze mode, FlexCAN requests to resume its clocks and, if enabled to do so, generates a Wake Up interrupt to the CPU. If a wakeup event is detected during Stop mode, then FlexCAN generates, if enabled to do so, a Wake Up interrupt to the CPU so that it can exit Stop mode globally and FlexCAN can request to resume the clocks. When FlexCAN is in a low-power mode other than Disable mode, this bit cannot be written as it is blocked by hardware. 0b - FlexCAN Self Wake Up feature is disabled. 1b - FlexCAN Self Wake Up feature is enabled.
21 WRNEN	Warning Interrupt Enable When asserted, this bit enables the generation of the TWRNINT and RWRNINT flags in the Error and Status Register 1 (ESR1). If WRNEN is negated, the TWRNINT and RWRNINT flags will always be zero, independent of the values of the error counters, and no warning interrupt will ever be generated. This bit can be written in Freeze mode only, because it is blocked by hardware in other modes. 0b - TWRNINT and RWRNINT bits are zero, independent of the values in the error counters. 1b - TWRNINT and RWRNINT bits are set when the respective error counter transitions from less than 96 to greater than or equal to 96.
20 LPMACK	Low-Power Mode Acknowledge This read-only bit indicates that FlexCAN is in a low-power mode (Disable mode, Doze mode, Stop mode). A low-power mode cannot be entered until all current transmission or reception processes have finished, so the CPU can poll the LPMACK bit to know when FlexCAN has actually entered low power mode. This bit is not affected by soft reset. **NOTE:** LPMACK will be asserted within 180 CAN bits from the low-power mode request by the CPU, and negated within 2 CAN bits after the low-power mode request removal (see Protocol timing). 0b - FlexCAN is not in a low-power mode. 1b - FlexCAN is in a low-power mode.
19 WAKSRC	Wake Up Source This bit defines whether the integrated low-pass filter is applied to protect the Rx CAN input from spurious wakeup. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0b - FlexCAN uses the unfiltered Rx input to detect recessive to dominant edges on the CAN bus. 1b - FlexCAN uses the filtered Rx input to detect recessive to dominant edges on the CAN bus.
18 DOZE	Doze Mode Enable This bit defines whether FlexCAN is allowed to enter low-power mode when Doze mode is requested at chip level. This bit is automatically reset when FlexCAN wakes up from Doze mode upon detecting activity on the CAN bus (self wakeup enabled). 0b - FlexCAN is not enabled to enter low-power mode when Doze mode is requested. 1b - FlexCAN is enabled to enter low-power mode when Doze mode is requested.
17 SRXDIS	Self Reception Disable This bit defines whether FlexCAN is allowed to receive frames transmitted by itself. If this bit is asserted, frames transmitted by the module will not be stored in any MB, regardless if the MB is programmed with an ID that matches the transmitted frame, and no interrupt flag or interrupt signal will be generated due to the frame reception. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0b - Self-reception enabled. 1b - Self-reception disabled.
16	Individual Rx Masking And Queue Enable

Table continues on the next page...

Field	Function
IRMQ	This bit indicates whether Rx matching process will be based either on individual masking and queue or on masking scheme with RXMGMASK, RX14MASK, RX15MASK, and RXFGMASK. This bit can be written in Freeze mode only because it is blocked by hardware in other modes. 0b - Individual Rx masking and queue feature are disabled. For backward compatibility with legacy applications, the reading of C/S word locks the MB even if it is EMPTY. 1b - Individual Rx masking and queue feature are enabled.
15 DMA	DMA Enable DMA controls whether the DMA feature is enabled or not. The DMA feature can only be used in Rx FIFO, so consequently MCR[RFEN] must be asserted. When DMA and RFEN are set, IFLAG1[BUF5I] generates the DMA request and no RX FIFO interrupt is generated. This bit can be written in Freeze mode only as it is blocked by hardware in other modes. 0b - DMA feature for RX FIFO disabled. 1b - DMA feature for RX FIFO enabled.
14 —	Reserved
13 LPRIOEN	Local Priority Enable This bit is provided for backwards compatibility with legacy applications. It controls whether the local priority feature is enabled or not. It is used to expand the ID used during the arbitration process. With this expanded ID concept, the arbitration process is done based on the full 32-bit word, but the actual transmitted ID still has 11-bit for standard frames and 29-bit for extended frames. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0b - Local Priority disabled. 1b - Local Priority enabled.
12 AEN	Abort Enable When asserted, this bit enables the Tx abort mechanism. This mechanism guarantees a safe procedure for aborting a pending transmission, so that no frame is sent in the CAN bus without notification. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. **NOTE:** When MCR[AEN] is asserted, only the abort mechanism (see Transmission abort mechanism) must be used for updating mailboxes configured for transmission. **CAUTION:** Writing the Abort code into Rx mailboxes can cause unpredictable results when MCR[AEN] is asserted. 0b - Abort disabled. 1b - Abort enabled.
11 FDEN	CAN FD operation enable This bit enables the CAN with Flexible Data rate (CAN FD) operation. This bit can be written in Freeze mode only. **NOTE:** FlexCAN is able to transmit FD frame format according to ISO 11898-1. **NOTE:** The Rx FIFO Enable (RFEN) bit cannot be set if FDEN is asserted. 0b - CAN FD is disabled. FlexCAN is able to receive and transmit messages in CAN 2.0 format. 1b - CAN FD is enabled. FlexCAN is able to receive and transmit messages in both CAN FD and CAN 2.0 formats.
10 —	Reserved
9-8 IDAM	ID Acceptance Mode This 2-bit field identifies the format of the Rx FIFO ID filter table elements. Note that all elements of the table are configured at the same time by this field (they are all the same format). See Rx FIFO structure. This field can be written only in Freeze mode because it is blocked by hardware in other modes. 00b - Format A: One full ID (standard and extended) per ID filter table element.

Table continues on the next page...

Field	Function
	01b - Format B: Two full standard IDs or two partial 14-bit (standard and extended) IDs per ID filter table element. 10b - Format C: Four partial 8-bit standard IDs per ID filter table element. 11b - Format D: All frames rejected.
7 —	Reserved
6-0 MAXMB	Number Of The Last Message Buffer This 7-bit field defines the number of the last message buffers that will take part in the matching and arbitration processes. The reset value (0Fh) is equivalent to a 16 MB configuration. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Number of the last MB = MAXMB **NOTE:** MAXMB must be programmed with a value smaller than or equal to the number of available message buffers, as described in FlexCAN memory partition for CAN FD. Additionally, the definition of MAXMB value must take into account the region of MBs occupied by Rx FIFO and its ID filters table space defined by CTRL2[RFFN]. MAXMB also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 11-171.

11.8.5.2.3 Control 1 Register (CTRL1)

11.8.5.2.3.1 Offset

Register	Offset
CTRL1	4h

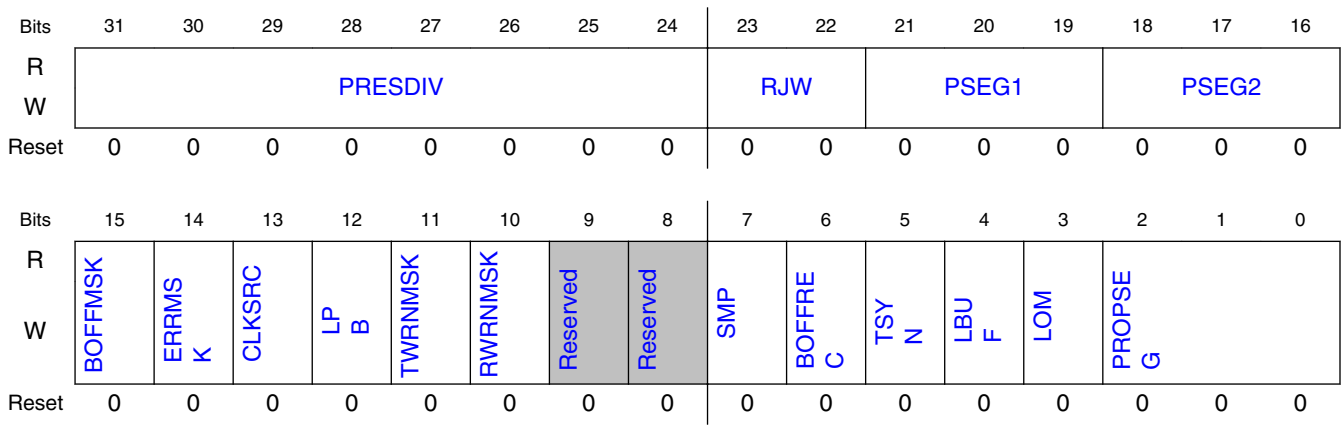
11.8.5.2.3.2 Function

This Register is defined for specific FlexCAN control features related to the CAN bus, such as bit rate, programmable sampling point within an Rx bit, Loop Back mode, Listen-Only mode, Bus Off recovery behavior, and interrupt enabling (Bus-Off, Error, Warning). It also determines the division factor for the clock prescaler.

The CAN bit timing variables (PRESDIV, PROPSEG, PSEG1, PSEG2, and RJW) can also be configured in the CBT register, which extends the range of all these variables. If CBT[BTF] is set, PRESDIV, PROPSEG, PSEG1, PSEG2, and RJW fields of CTRL1 become read only.

NOTE

When the CAN FD feature is enabled, do not use the PRESDIV, RJW, PSEG1, PSEG2, and PROPSEG fields of the CTRL1 register for CAN bit timing. Instead use the CBT



register's EPRESDIV, ERJW, EPSEG1, EPSEG2, and EPROPSEG fields.

NOTE

The CAN bit variables in CTRL1 and in CBT are stored in the same register.

The contents of this register are not affected by soft reset.

11.8.5.2.3.3 Diagram

11.8.5.2.3.4 Fields

Field	Function
31-24 PRESDIV	Prescaler Division Factor This 8-bit field defines the ratio between the PE clock frequency and the serial clock (Sclock) frequency. The Sclock period defines the time quantum of the CAN protocol. For the reset value, the Sclock frequency is equal to the PE clock frequency. The maximum value of this field is FFh, which gives a minimum Sclock frequency equal to the PE clock frequency divided by 256. See Protocol timing for more information. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Sclock frequency = PE clock frequency / (PRESDIV + 1).
23-22 RJW	Resync Jump Width This 2-bit field defines the maximum number of time quanta that a bit time can be changed by one resynchronization. One time quantum is equal to the Sclock period. The valid programmable values are 0–3. See Protocol timing for more information. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Resync Jump Width = RJW + 1.
21-19 PSEG1	Phase Segment 1 This 3-bit field defines the length of phase segment 1 in the bit time. The valid programmable values are 0–7. See Protocol timing for more information. This field can be written only in Freeze mode because it is blocked by hardware in other modes.

Table continues on the next page...

Field	Function
	Phase Buffer Segment 1 = (PSEG1 + 1) × Time-Quanta.
18-16 PSEG2	Phase Segment 2 This 3-bit field defines the length of phase segment 2 in the bit time. The valid programmable values are 1–7. See Protocol timing for more information. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Phase Buffer Segment 2 = (PSEG2 + 1) × Time-Quanta.
15 BOFFMSK	Bus Off Interrupt Mask This bit provides a mask for the Bus Off interrupt ESR1[BOFFINT]. 0b - Bus Off interrupt disabled. 1b - Bus Off interrupt enabled.
14 ERRMSK	Error Interrupt Mask This bit provides a mask for the Error interrupt ESR1[ERRINT]. 0b - Error interrupt disabled. 1b - Error interrupt enabled.
13 CLKSRC	CAN Engine Clock Source This bit selects the clock source to the CAN Protocol Engine (PE) to be either the peripheral clock or the oscillator clock. The selected clock is the one fed to the prescaler to generate the serial clock (Sclock). In order to guarantee reliable operation, this bit can be written only in Disable mode because it is blocked by hardware in other modes. See Protocol timing. **NOTE:** The user must ensure the protocol engine clock tolerance according to the CAN Protocol standard (ISO 11898-1). **NOTE:** See the clock distribution chapter (module clocks table) to identify the proper clock source. 0b - The CAN engine clock source is the oscillator clock. Under this condition, the oscillator clock frequency must be lower than the bus clock. 1b - The CAN engine clock source is the peripheral clock.
12 LPB	Loop Back Mode This bit configures FlexCAN to operate in Loop-Back mode. In this mode, FlexCAN performs an internal loop back that can be used for self-test operation. The bit stream output of the transmitter is fed back internally to the receiver input. The Rx CAN input pin is ignored and the Tx CAN output goes to the recessive state (logic 1). FlexCAN behaves as it normally does when transmitting, and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field, generating an internal acknowledge bit to ensure proper reception of its own message. Both transmit and receive interrupts are generated. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. **NOTE:** In this mode, MCR[SRXDIS] cannot be asserted because this will impede the self-reception of a transmitted message. **NOTE:** FDCTRL[TDCEN] must be disabled when LPB is asserted. 0b - Loop Back disabled. 1b - Loop Back enabled.
11 TWRNMSK	Tx Warning Interrupt Mask This bit provides a mask for the Tx Warning interrupt associated with the TWRNINT flag in the Error and Status Register 1 (ESR1). This bit is read as zero when MCR[WRNEN] is negated. This bit can be written only if MCR[WRNEN] is asserted. 0b - Tx Warning interrupt disabled. 1b - Tx Warning interrupt enabled.
10 RWRNMSK	Rx Warning Interrupt Mask

Table continues on the next page...

Field	Function
	This bit provides a mask for the Rx Warning interrupt associated with the RWRNINT flag in the Error and Status Register 1 (ESR1). This bit is read as zero when MCR[WRNEN] bit is negated. This bit can be written only if MCR[WRNEN] bit is asserted. 0b - Rx Warning interrupt disabled. 1b - Rx Warning interrupt enabled.
9 —	Reserved
8 —	Reserved
7 SMP	CAN Bit Sampling This bit defines the sampling mode of CAN bits at the Rx input. It can be written in Freeze mode only, because it is blocked by hardware in other modes. **NOTE:** For proper operation, to assert SMP it is necessary to guarantee a minimum value of two TQs in CTRL1[PSEG1] (or CBT[EPSEG1]).This bit cannot be asserted when CAN FD is enabled (MCR[FDEN] = 1). 0b - Just one sample is used to determine the bit value. 1b - Three samples are used to determine the value of the received bit: the regular one (sample point) and two preceding samples; a majority rule is used.
6 BOFFREC	Bus Off Recovery This bit defines how FlexCAN recovers from Bus Off state. If this bit is negated, automatic recovering from Bus Off state occurs according to the CAN Specification 2.0B. If the bit is asserted, automatic recovering from Bus Off is disabled and the module remains in Bus Off state until the bit is negated by the user. If the negation occurs before 128 sequences of 11 recessive bits are detected on the CAN bus, then Bus Off recovery happens as if the BOFFREC bit had never been asserted. If the negation occurs after 128 sequences of 11 recessive bits occurred, then FlexCAN will resynchronize to the bus by waiting for 11 recessive bits before joining the bus. After negation, the BOFFREC bit can be reasserted again during Bus Off, but it will be effective only the next time the module enters Bus Off. If BOFFREC was negated when the module entered Bus Off, asserting it during Bus Off will not be effective for the current Bus Off recovery. **NOTE:** See Bus off in the CAN Protocol standard (ISO 11898-1) for details. 0b - Automatic recovering from Bus Off state enabled. 1b - Automatic recovering from Bus Off state disabled.
5 TSYN	Timer Sync This bit enables a mechanism that resets the free running timer each time a message is received in message buffer 0. This feature provides means to synchronize multiple FlexCAN stations with a special “SYNC” message, that is, global network time. If MCR[RFEN] is set (Rx FIFO enabled), the first available mailbox, according to CTRL2[RFFN] setting, is used for timer synchronization instead of MB0. This bit can be written in Freeze mode only because it is blocked by hardware in other modes. 0b - Timer sync feature disabled 1b - Timer sync feature enabled
4 LBUF	Lowest Buffer Transmitted First This bit defines the ordering mechanism for message buffer transmission. When asserted, MCR[LPRIOEN] does not affect the priority arbitration. This bit can be written in Freeze mode only, because it is blocked by hardware in other modes. 0b - Buffer with highest priority is transmitted first. 1b - Lowest number buffer is transmitted first.
3 LOM	Listen-Only Mode

Table continues on the next page...

Field	Function
	This bit configures FlexCAN to operate in Listen-Only mode. In this mode, transmission is disabled, all error counters described in the ECR register are frozen, and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FlexCAN detects a message that has not been acknowledged, it will flag a BIT0 error without changing the receive error counter (ECR[RXERRCNT]), as if it was trying to acknowledge the message. Listen-Only mode is acknowledged by the state of ESR1[FLTCONF] indicating Passive Error. There can be some delay between the Listen-Only mode request and acknowledge. This bit can be written in Freeze mode only because it is blocked by hardware in other modes. 0b - Listen-Only mode is deactivated. 1b - FlexCAN module operates in Listen-Only mode.
2-0 PROPSEG	Propagation Segment This 3-bit field defines the length of the propagation segment in the bit time. The valid programmable values are 0–7. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Propagation segment time = (PROPSEG + 1) × time-quanta. Time-quantum = one Sclock period.

11.8.5.2.4 Free Running Timer (TIMER)

11.8.5.2.4.1 Offset

Register	Offset
TIMER	8h

11.8.5.2.4.2 Function

This register represents a 16-bit free-running counter that can be read and written by the CPU. The timer starts from 0h after Reset, counts linearly to FFFFh, and wraps around.

The timer is incremented by the CAN bit clock, which defines the baud rate on the CAN bus. During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate. The timer is not incremented during Disable, Doze, Stop and Freeze modes.

The timer value is captured when the second bit of the identifier field of any frame is on the CAN bus. This captured value is written into the time stamp entry in a message buffer after a successful reception or transmission of a message.

If CTRL1[TSYN] is asserted, the timer is reset whenever a message is received in the first available mailbox, according to CTRL2[RFFN] setting.

The CPU can write to this register anytime. However, if the write occurs at the same time that the timer is being reset by a reception in the first mailbox, then the write value is discarded.

Reading this register affects the mailbox unlocking procedure (see Mailbox lock mechanism).

11.8.5.2.4.3 Diagram

11.8.5.2.5 Rx Mailboxes Global Mask Register (RXMGMASK)

11.8.5.2.5.1 Offset

Register	Offset
RXMGMASK	10h

11.8.5.2.5.2 Function

This register is located in RAM.

RXMGMASK is provided for legacy application support.

- When MCR[IRMQ] is negated, RXMGMASK is always in effect (the bits in the MG field will mask the mailbox filter bits).
- When MCR[IRMQ] is asserted, RXMGMASK has no effect (the bits in the MG field will not mask the mailbox filter bits).

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

11.8.5.2.5.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

11.8.5.2.5.4 Fields

Field	Function
31-0 MG	Rx Mailboxes Global Mask Bits These bits mask the mailbox filter bits. Note that the alignment with the ID word of the mailbox is not perfect as the two most significant MG bits affect the fields RTR and IDE, which are located in the Control and Status word of the mailbox. The following table shows in detail which MG bits mask each mailbox filter field.

SMB[RTR] [-1]	CTRL2[RRS]	CTRL2[EACEN]	Mailbox filter fields			
			MB[RTR]	MB[IDE]	MB[ID]	Reserved
0	—	0	note [-1]	note [-1]	MG[28:0]	MG[31:29]
0	—	1	MG[31]	MG[30]	MG[28:0]	MG[29]
1	0	—	—	—	—	MG[31:0]
1	1	0	—	—	MG[28:0]	MG[31:29]
1	1	1	MG[31]	MG[30]	MG[28:0]	MG[29]

1. RTR bit of the incoming frame. It is saved into an auxiliary MB called Rx serial message buffer (Rx SMB).
2. If CTRL2[EACEN] is negated, the RTR bit of mailbox is never compared with the RTR bit of the incoming frame.

Field	Function
	3. If CTRL2[EACEN] is negated, the IDE bit of mailbox is always compared with the IDE bit of the incoming frame. 0b - The corresponding bit in the filter is "don't care." 1b - The corresponding bit in the filter is checked.

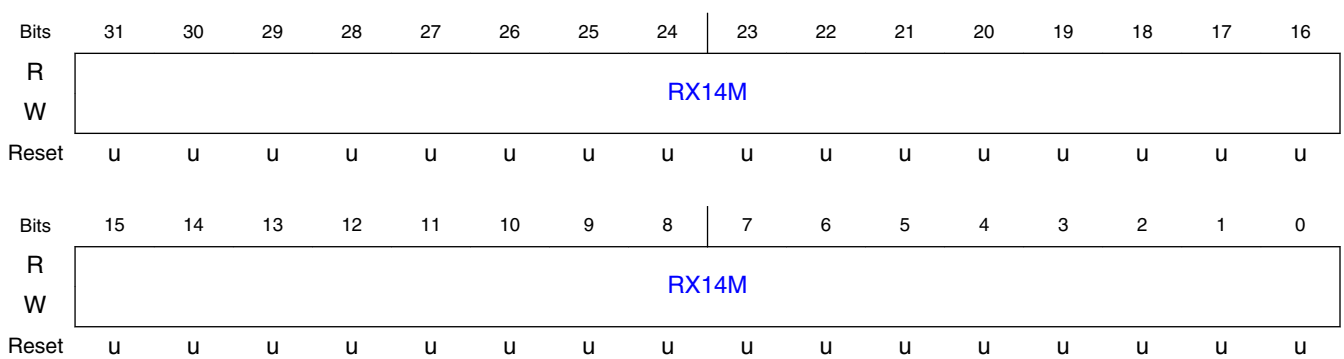
1. RTR bit of the incoming frame. It is saved into an auxiliary MB called Rx serial message buffer (Rx SMB).
2. If CTRL2[EACEN] is negated, the RTR bit of mailbox is never compared with the RTR bit of the incoming frame.
3. If CTRL2[EACEN] is negated, the IDE bit of mailbox is always compared with the IDE bit of the incoming frame.

11.8.5.2.6 Rx 14 Mask Register (RX14MASK)

11.8.5.2.6.1 Offset

Register	Offset
RX14MASK	14h

11.8.5.2.6.2 Function



This register is located in RAM.

RX14MASK is provided for legacy application support. When MCR[IRMQ] is asserted, RX14MASK has no effect.

RX14MASK is used to mask the filter fields of message buffer 14.

This register can only be programmed when the module is in Freeze mode as it is blocked by hardware in other modes.

11.8.5.2.6.3 Diagram

11.8.5.2.6.4 Fields

Field	Function
31-0 RX14M	Rx Buffer 14 Mask Bits Each mask bit masks the corresponding mailbox 14 filter field in the same way that RXMGMASK masks other mailboxes' filters. See the description of the RXMGMASK register. 0b - The corresponding bit in the filter is "don't care." 1b - The corresponding bit in the filter is checked.

11.8.5.2.7 Rx 15 Mask Register (RX15MASK)

11.8.5.2.7.1 Offset

Register	Offset
RX15MASK	18h

11.8.5.2.7.2 Function

This register is located in RAM.

RX15MASK is provided for legacy application support. When MCR[IRMQ] is asserted, RX15MASK has no effect.

RX15MASK is used to mask the filter fields of message buffer 15.

This register can be programmed only when the module is in Freeze mode because it is blocked by hardware in other modes.

11.8.5.2.7.4 Fields

Field	Function
31-0 RX15M	Rx Buffer 15 Mask Bits Each mask bit masks the corresponding mailbox 15 filter field in the same way that RXMGMASK masks other mailboxes' filters. See the description of the RXMGMASK register. 0b - The corresponding bit in the filter is "don't care." 1b - The corresponding bit in the filter is checked.

11.8.5.2.8 Error Counter (ECR)

11.8.5.2.8.1 Offset

Register	Offset
ECR	1Ch

11.8.5.2.8.2 Function

This register has four 8-bit fields reflecting the value of the FlexCAN error counters:

- Transmit Error Counter (TXERRCNT field)
- Receive Error Counter (RXERRCNT field)
- Transmit Error Counter for errors detected in the data phase of CAN FD messages with the BRS bit set (TXERRCNT_FAST field)
- Receive Error Counter for errors detected in the data phase of CAN FD messages with the BRS bit set (RXERRCNT_FAST field)

The TXERRCNT and RXERRCNT counters take into account all errors in both CAN FD and non-FD message formats. TXERRCNT_FAST and RXERRCNT_FAST are dedicated to count only the errors that occur in the data phase of CAN FD frames with the BRS bit set.

The Fault Confinement state (ESR1[FLTCONF]) is updated based on TXERRCNT and RXERRCNT counters only. TXERRCNT and RXERRCNT counters can be written in Freeze mode only. TXERRCNT_FAST and RXERRCNT_FAST counters are read-only except in Freeze mode when the CPU can write value zero. The rules for increasing and decreasing these counters are described in the CAN protocol and are completely implemented in the FlexCAN module.

The following are the basic rules for FlexCAN bus state transitions:

- If the value of TXERRCNT or RXERRCNT becomes greater than or equal to 128, ESR1[FLTCONF] is updated to reflect Error Passive state.
- If the FlexCAN state is Error Passive, and either TXERRCNT or RXERRCNT decrements to a value less than or equal to 127 when the other already satisfies this condition, ESR1[FLTCONF] is updated to reflect Error Active state.
- If the value of TXERRCNT becomes greater than 255, ESR1[FLTCONF] is updated to reflect Bus Off state, and an interrupt may be issued. The value of TXERRCNT is then reset to zero.
- If FlexCAN is in Bus Off state, then TXERRCNT is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, TXERRCNT is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around when incrementing the TXERRCNT. When TXERRCNT reaches the value of 128, ESR1[FLTCONF] is updated to be Error Active and both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the TXERRCNT value. The TXERRCNT_FAST counter is frozen during Bus Off.
- If during system startup only one node is operating, then its TXERRCNT increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACKERR bit in the Error and Status Register). After the transition to Error Passive state, TXERRCNT does not increment anymore by acknowledge errors. Therefore the device never goes to the Bus Off state.
- If RXERRCNT increases to a value greater than 127, it is not incremented further, even if more errors are detected when being a receiver. At the next successful message reception, the counter is set to a value between 119 and 127 to return to Error Active state.
- TXERRCNT_FAST and RXERRCNT_FAST error counter values increment and decrement based on errors detected only in the data phase of CAN FD frames with the BRS bit set, following the same increment and decrement rules as TXERRCNT and RXERRCNT counters. These counters do not wrap around and get stuck at their maximum value (255). They stop counting and keep their values frozen when FlexCAN is in Bus Off state. They are reset when FlexCAN leaves Bus Off state and restart counting after FlexCAN returns to Error Active state.

NOTE

See Fault confinement in the CAN Protocol standard (ISO 11898-1) for details.

11.8.5.2.8.4 Fields

Field	Function
31-24 RXERRCNT_FAST	Receive Error Counter for fast bits Receive error counter for errors detected in the data phase of received CAN FD messages with the BRS bit set. The RXERRCNT_FAST counter is read-only except in Freeze mode, where the CPU can write an 8-bit zero value only.
23-16 TXERRCNT_FAST	Transmit Error Counter for fast bits Transmit error counter for errors detected in the data phase of transmitted CAN FD messages with the BRS bit set. The TXERRCNT_FAST counter is read-only except in Freeze mode, where the CPU can write an 8-bit zero value only.
15-8 RXERRCNT	Receive Error Counter Receive error counter for all errors detected in received messages. The RXERRCNT counter is read-only except in Freeze mode, where it can be written by the CPU.
7-0 TXERRCNT	Transmit Error Counter Transmit error counter for all errors detected in transmitted messages. The TXERRCNT counter is read-only except in Freeze mode, where it can be written by the CPU.

11.8.5.2.9 Error and Status 1 Register (ESR1)

11.8.5.2.9.1 Offset

Register	Offset
ESR1	20h

11.8.5.2.9.2 Function

This register reports various error conditions detected in the reception and transmission of a CAN frame, some general status of the device, and is the source of some interrupts to the CPU. The reported error conditions are:

NOTE

Reading Host can clear these field.

- Errors detected in CAN frames of any format:
  - BIT1ERR
  - BIT0ERR
  - ACKKERR
  - CRCERR
  - FRMERR
  - STFERR
- Errors detected in the data phase of CAN FD frames with the BRS bit set only:
  - BIT1ERR_FAST
  - BIT0ERR_FAST
  - CRCERR_FAST
  - FRMERR_FAST
  - STFERR_FAST

An error detected in a single CAN frame may be reported by one or more error flags. Also, error reporting is cumulative, in case more error events happen in the next frames when the CPU does not attempt to read this register.

Status bits:
- TXWRN
- RXWRN
- IDLE
- TX
- FLTCONF
- RX
- SYNCH

Interrupt bits:
- BOFFINT
- BOFFDONEINT
- ERRINT
- ERRINT_FAST
- WAKINT
- TWRNINT
- RWRNINT

It is recommended that the CPU use the following procedure when servicing interrupt requests generated by these bits:

1. Read this register to capture all error condition and status bits. This action clears the respective bits that were set since the last read access.
2. Write 1 to clear the interrupt bit that has triggered the interrupt request.
3. Write 1 to clear the ERR_OVR bit, if it is set.

Starting from all error flags cleared, a first error event sets either the ERRINT or the ERRINT_FAST (provided the corresponding mask bit is asserted). If other error events in subsequent frames happen before the CPU serves the interrupt request, the ERR_OVR bit is set to indicate that errors from different frames have accumulated.

Table 11-177. Can bus status

SYNCH	IDLE	TX	RX	FlexCAN state
0	0	0	0	Not synchronized to CAN bus
1	1	x	x	Idle
1	0	1	0	Transmitting
1	0	0	1	Receiving

NOTE

See Fault confinement in the CAN Protocol standard (ISO 11898-1) for details.

11.8.5.2.9.4 Fields

Field	Function
31 BIT1ERR_FAST	Bit1 Error in the Data Phase of CAN FD frames with the BRS bit set This bit indicates when an inconsistency occurs between the transmitted and the received bit in the data phase of CAN FD frames with the BRS bit set. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - At least one bit sent as recessive is received as dominant.
30 BIT0ERR_FAST	Bit0 Error in the Data Phase of CAN FD frames with the BRS bit set This bit indicates when an inconsistency occurs between the transmitted and the received bit in the data phase of CAN FD frames with the BRS bit set. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - At least one bit sent as dominant is received as recessive.
29 —	Reserved
28 CRCERR_FAST	Cyclic Redundancy Check Error in the CRC field of CAN FD frames with the BRS bit set This bit indicates that a CRC error has been detected by the receiver node in the CRC field of CAN FD frames with the BRS bit set, that is, the calculated CRC is different from the received. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - A CRC error occurred since last read of this register.
27 FRMERR_FAST	Form Error in the Data Phase of CAN FD frames with the BRS bit set This bit indicates that a form error has been detected by the receiver node in the data phase of CAN FD frames with the BRS bit set, that is, a fixed-form bit field contains at least one illegal bit. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - A form error occurred since last read of this register.
26 STFERR_FAST	Stuffing Error in the Data Phase of CAN FD frames with the BRS bit set This bit indicates that a stuffing error has been detected in the data phase of CAN FD frames with the BRS bit set. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - A stuffing error occurred since last read of this register.
25-22 —	Reserved
21 ERROVR	Error Overrun This bit indicates that an error condition occurred when any error flag is already set. This bit is cleared by writing it to 1. 0b - Overrun has not occurred. 1b - Overrun has occurred.
20	Error interrupt for errors detected in Data Phase of CAN FD frames with BRS bit set

Table continues on the next page...

Field	Function
ERRINT_FAST	This bit indicates that at least one of the error bits detected in the data phase of CAN FD frames with the BRS bit set (BIT1ERR_FAST, BIT0ERR_FAST, CRCERR_FAST, FRMERR_FAST, or STFERR_FAST) is set. If the corresponding mask bit CTRL2[ERRMSK_FAST] is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. Writing 0 has no effect. 0b - No such occurrence. 1b - Indicates setting of any error bit detected in the data phase of CAN FD frames with the BRS bit set.
19 BOFFDONEINT	Bus Off Done Interrupt This bit is set when the Tx Error Counter (TXERRCNT) has finished counting 128 occurrences of 11 consecutive recessive bits on the CAN bus and is ready to leave Bus Off. If the corresponding mask bit in the Control 2 Register (BOFFDONEMSK) is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. Writing 0 has no effect. 0b - No such occurrence. 1b - FlexCAN module has completed Bus Off process.
18 SYNCH	CAN Synchronization Status This read-only flag indicates whether the FlexCAN is synchronized to the CAN bus and able to participate in the communication process. It is set and cleared by the FlexCAN. See the table in the overall ESR1 register description. 0b - FlexCAN is not synchronized to the CAN bus. 1b - FlexCAN is synchronized to the CAN bus.
17 TWRNINT	Tx Warning Interrupt Flag If MCR[WRNEN] is asserted, TWRNINT is set when the TXWRN flag transitions from 0 to 1, meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control 1 Register (CTRL1[TWRNMSK]) is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. When MCR[WRNEN] is negated, this flag is masked. CPU must clear this flag before disabling MCR[WRNEN]. Otherwise it will be set when MCR[WRNEN] is set again. Writing 0 has no effect. This flag is not generated during Bus Off state. This bit is not updated during Freeze mode. 0b - No such occurrence. 1b - The Tx error counter transitioned from less than 96 to greater than or equal to 96.
16 RWRNINT	Rx Warning Interrupt Flag If MCR[WRNEN] is asserted, RWRNINT is set when the RXWRN flag transitions from 0 to 1, meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control 1 Register (CTRL1[RWRNMSK]) is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. When WRNEN is negated, this flag is masked. CPU must clear this flag before disabling the bit. Otherwise it will be set when WRNEN is set again. Writing 0 has no effect. This bit is not updated during Freeze mode. 0b - No such occurrence. 1b - The Rx error counter transitioned from less than 96 to greater than or equal to 96.
15 BIT1ERR	Bit1 Error This bit indicates when an inconsistency occurs between the transmitted and the received bit in a non-CAN FD message or in the arbitration or data phase of a CAN FD message. **NOTE:** This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - At least one bit sent as recessive is received as dominant.
14 BIT0ERR	Bit0 Error This bit indicates when an inconsistency occurs between the transmitted and the received bit in a non-CAN FD message or in the arbitration or data phase of a CAN FD message.

Table continues on the next page...

Field	Function
	After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - At least one bit sent as dominant is received as recessive.
13 ACKERR	Acknowledge Error This bit indicates that an Acknowledge Error has been detected by the transmitter node, that is, a dominant bit has not been detected during the ACK SLOT. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - An ACK error occurred since last read of this register.
12 CRCERR	Cyclic Redundancy Check Error This bit indicates that a Cyclic Redundancy Check (CRC) error has been detected by the receiver node either in a non-FD message or in the arbitration or data phase of a frame in CAN FD format, that is, the calculated CRC is different from the received. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - A CRC error occurred since last read of this register.
11 FRMERR	Form Error This bit indicates that a form error has been detected in a non-FD message or else in an FD message's arbitration or data phase by the receiver node, that is, a fixed-form bit field contains at least one illegal bit. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - A Form Error occurred since last read of this register.
10 STFERR	Stuffing Error This bit indicates that a stuffing error has been detected in a non-FD message or else in an FD message's arbitration or data phase by the receiver node. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - A stuffing error occurred since last read of this register.
9 TXWRN	TX Error Warning This bit indicates when repetitive errors are occurring during message transmission and is affected by the value of TXERRCNT in ECR register only. This bit is not updated during Freeze mode. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - TXERRCNT is greater than or equal to 96.
8 RXWRN	Rx Error Warning This bit indicates when repetitive errors are occurring during message reception and is affected by the value of RXERRCNT in ECR register only. This bit is not updated during Freeze mode. After a read operation, the field's value clears to 0. 0b - No such occurrence. 1b - RXERRCNT is greater than or equal to 96.
7 IDLE	IDLE This bit indicates when CAN bus is in IDLE state. See the table in the overall ESR1 register description. 0b - No such occurrence. 1b - CAN bus is now IDLE.

Table continues on the next page...

Field	Function
6 TX	FlexCAN In Transmission This bit indicates if FlexCAN is transmitting a message. See the table in the overall ESR1 register description. 0b - FlexCAN is not transmitting a message. 1b - FlexCAN is transmitting a message.
5-4 FLTCONF	Fault Confinement State This 2-bit field indicates the confinement state of the FlexCAN module. If CTRL1[LOM] is asserted, after a delay that depends on the CAN bit timing, ESR1[FLTCONF] will indicate Error Passive. The very same delay affects the way that ESR1[FLTCONF] reflects an update to ECR register by the CPU. It may be necessary to wait up to one CAN bit time to get them coherent again. This bit field is affected by soft reset, but if the LOM bit is asserted, its reset value lasts just one CAN bit. After this time, ESR1[FLTCONF] reports Error Passive. 00b - Error Active 01b - Error Passive 1xb - Bus Off
3 RX	FlexCAN In Reception This bit indicates if FlexCAN is receiving a message. See the table in the overall ESR1 register description. 0b - FlexCAN is not receiving a message. 1b - FlexCAN is receiving a message.
2 BOFFINT	Bus Off Interrupt This bit is set when FlexCAN enters Bus Off state. If the corresponding mask bit in the Control Register 1 (CTRL1[BOFFMSK]) is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. Writing 0 has no effect. 0b - No such occurrence. 1b - FlexCAN module entered Bus Off state.
1 ERRINT	Error Interrupt This bit indicates that at least one of the error bits (BIT1ERR, BIT0ERR, ACKERR, CRCERR, FRMERR, or STFERR) is set. If the corresponding mask bit CTRL1[ERRMSK] is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. Writing 0 has no effect. 0b - No such occurrence. 1b - Indicates setting of any error bit in the Error and Status register.
0 WAKINT	Wake-Up Interrupt This field applies when FlexCAN is in low-power mode under Self Wake Up mechanism: • Doze mode • Stop mode When a recessive-to-dominant transition is detected on the CAN bus and if MCR[WAKMSK] is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. When MCR[SLFWAK] is negated, this flag is masked. The CPU must clear this flag before disabling the bit. Otherwise it will be set when SLFWAK is set again. Writing 0 has no effect. 0b - No such occurrence. 1b - Indicates a recessive to dominant transition was received on the CAN bus.

11.8.5.2.10 Interrupt Masks 2 Register (IMASK2)

11.8.5.2.10.1 Offset

Register	Offset
IMASK2	24h

11.8.5.2.10.2 Function

This register allows any number of a range of the 32 message buffer interrupts to be enabled or disabled for MB63 to MB32. It contains one interrupt mask bit per buffer, enabling the CPU to determine which buffer generates an interrupt after a successful transmission or reception, that is, when the corresponding IFLAG2 bit is set.

11.8.5.2.10.3 Diagram

11.8.5.2.11.4 Fields

Field	Function
31-0 BUF31TO0M	Buffer MBi Mask Each bit enables or disables the corresponding FlexCAN message buffer interrupt for MB31 to MB0. **NOTE:** Setting or clearing a bit in the IMASK1 Register can assert or negate an interrupt request, if the corresponding IFLAG1 bit is set. 0b - The corresponding buffer interrupt is disabled. 1b - The corresponding buffer interrupt is enabled.

11.8.5.2.12 Interrupt Flags 2 Register (IFLAG2)

11.8.5.2.12.1 Offset

Register	Offset
IFLAG2	2Ch

11.8.5.2.12.2 Function

This register defines the flags for the 32 message buffer interrupts for MB63 to MB32. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the respective IFLAG2 bit. If the corresponding IMASK2 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing 1 to it. Writing 0 has no effect.

Before updating MCR[MAXMB], CPU must service the IFLAG2 bits whose MB value is greater than the MAXMB to be updated; otherwise, they will remain set and be inconsistent with the number of MBs available.

11.8.5.2.12.3 Diagram

11.8.5.2.12.4 Fields

Field	Function
31-0 BUF63TO32I	Buffer MBi Interrupt Each bit flags the corresponding FlexCAN message buffer interrupt for MB63 to MB32. 0b - The corresponding buffer has no occurrence of successfully completed transmission or reception. 1b - The corresponding buffer has successfully completed transmission or reception.

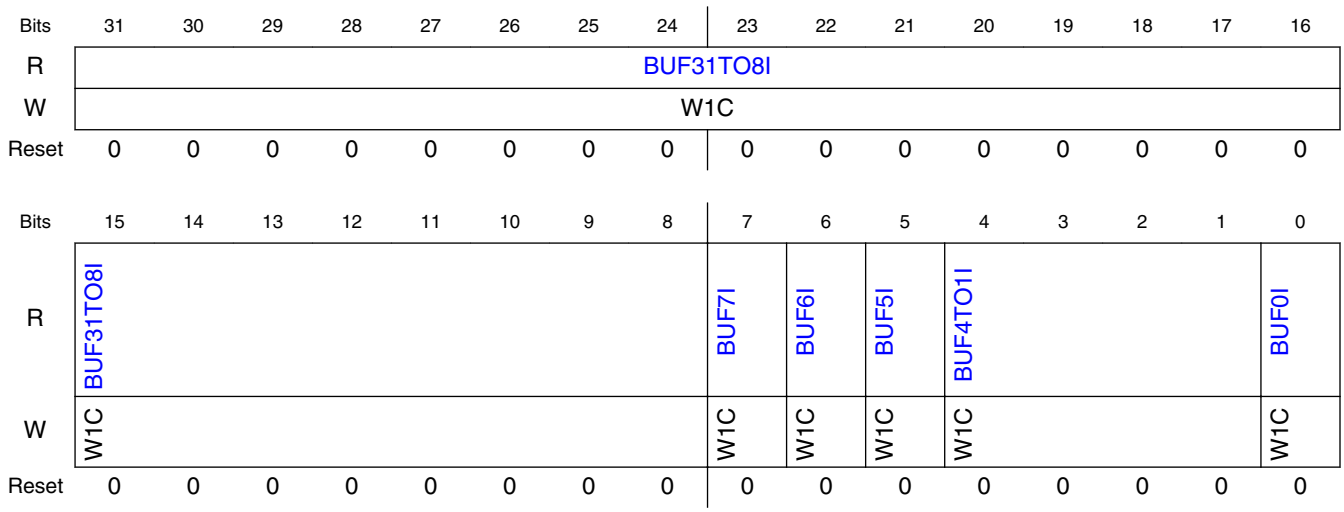
11.8.5.2.13 Interrupt Flags 1 Register (IFLAG1)

11.8.5.2.13.1 Offset

Register	Offset
IFLAG1	30h

11.8.5.2.13.2 Function

This register defines the flags for the 32 message buffer interrupts for MB31 to MB0. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG1 bit. If the corresponding IMASK1 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing 1 to it. Writing 0 has no effect. There is an exception when DMA for Rx FIFO is enabled, as described below.



The BUF7I to BUF5I flags are also used to represent FIFO interrupts when the Rx FIFO is enabled. When MCR[RFEN] is set and MCR[DMA] is negated, the function of the eight least significant interrupt flags changes: BUF7I, BUF6I, and BUF5I indicate operating conditions of the FIFO , BUF0I is used to empty FIFO, and BUF4I to BUF1I bits are reserved.

Before enabling MCR[RFEN], the CPU must service the IFLAG bits asserted in the Rx FIFO region; see Rx FIFO. Otherwise, these IFLAG bits will mistakenly show the related MBs now belonging to FIFO as having contents to be serviced. When MCR[RFEN] is negated, the FIFO flags must be cleared. The same care must be taken when a CTRL2[RFFN] value is selected, extending Rx FIFO filters beyond MB7. For example, when RFFN is 8h, the MB0–23 range is occupied by Rx FIFO filters and related IFLAG bits must be cleared.

When both the MCR[RFEN] and MCR[DMA] bits are asserted (DMA feature for Rx FIFO enabled), the function of the eight least significant interrupt flags (BUF7I–BUF0I) are changed to support the DMA operation. BUF7I and BUF6I are not used, as well as BUF4I–BUF1I. BUF5I indicates operating condition of FIFO, and BUF0I is used to empty FIFO. Moreover, BUF5I does not generate a CPU interrupt, but generates a DMA request. IMASK1 bits in Rx FIFO region are not considered when bit MCR[DMA] is enabled. In addition the CPU must not clear the flag BUF5I when DMA is enabled. Before enabling MCR[DMA], the CPU must service the IFLAGs asserted in the Rx FIFO region. When MCR[DMA] is negated, the FIFO must be empty. FIFO must be disabled when MCR[FDEN] is enabled.

Before updating MCR[MAXMB], CPU must service the IFLAG1 bits whose MB value is greater than the MCR[MAXMB] to be updated; otherwise, they will remain set and be inconsistent with the number of MBs available.

11.8.5.2.13.3 Diagram

11.8.5.2.13.4 Fields

Field	Function
31-8 BUF31TO8I	Buffer MBi Interrupt Each bit flags the corresponding FlexCAN message buffer interrupt for MB31 to MB8. 0b - The corresponding buffer has no occurrence of successfully completed transmission or reception. 1b - The corresponding buffer has successfully completed transmission or reception.
7 BUF7I	Buffer MB7 Interrupt Or Rx FIFO Overflow When MCR[RFEN] is cleared (Rx FIFO disabled), this bit flags the interrupt for MB7. **NOTE:** This flag is cleared by the FlexCAN whenever MCR[RFEN] is changed by CPU writes. The BUF7I flag represents Rx FIFO overflow when MCR[RFEN] is set. In this case, the flag indicates that a message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a mailbox. 0b - No occurrence of MB7 completing transmission/reception when MCR[RFEN]=0, or of Rx FIFO overflow when MCR[RFEN]=1 1b - MB7 completed transmission/reception when MCR[RFEN]=0, or Rx FIFO overflow when MCR[RFEN]=1
6 BUF6I	Buffer MB6 Interrupt Or Rx FIFO Warning When MCR[RFEN] is cleared (Rx FIFO disabled), this bit flags the interrupt for MB6. **NOTE:** This flag is cleared by the FlexCAN whenever MCR[RFEN] is changed by CPU writes. The BUF6I flag represents Rx FIFO warning when MCR[RFEN] is set. In this case, the flag indicates when the number of unread messages within the Rx FIFO is increased to five from four due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared when the number of unread messages is greater than four, it does not assert again until the number of unread messages within the Rx FIFO is decreased to be equal to or less than four. 0b - No occurrence of MB6 completing transmission/reception when MCR[RFEN]=0, or of Rx FIFO almost full when MCR[RFEN]=1

Table continues on the next page...

Field	Function
	1b - MB6 completed transmission/reception when MCR[RFEN]=0, or Rx FIFO almost full when MCR[RFEN]=1
5 BUF5I	Buffer MB5 Interrupt Or Frames available in Rx FIFO When MCR[RFEN] is cleared (Rx FIFO disabled), this field flags the interrupt for MB5. **NOTE:** This flag is cleared by the FlexCAN whenever MCR[RFEN] is changed by CPU writes. When MCR[RFEN] is set (Rx FIFO enabled), the BUF5I flag represents "Frames available in Rx FIFO" and indicates that at least one frame is available to be read from the Rx FIFO. When the MCR[DMA] bit is enabled, this flag generates a DMA request and the CPU must not clear this bit by writing 1 in BUF5I. 0b - No occurrence of MB5 completing transmission/reception when MCR[RFEN]=0, or of frame(s) available in the FIFO, when MCR[RFEN]=1 1b - MB5 completed transmission/reception when MCR[RFEN]=0, or frame(s) available in the Rx FIFO when MCR[RFEN]=1. It generates a DMA request in case of MCR[RFEN] and MCR[DMA] are enabled.
4-1 BUF4TO1I	Buffer MBi Interrupt Or Reserved When MCR[RFEN] is cleared (Rx FIFO disabled), these bits flag the interrupts for MB4 to MB1. **NOTE:** These flags are cleared by the FlexCAN whenever MCR[RFEN] is changed by CPU writes. The BUF4TO1I flags are reserved when MCR[RFEN] is set. 0b - The corresponding buffer has no occurrence of successfully completed transmission or reception when MCR[RFEN]=0. 1b - The corresponding buffer has successfully completed transmission or reception when MCR[RFEN]=0.
0 BUF0I	Buffer MB0 Interrupt Or Clear FIFO bit When MCR[RFEN] is cleared (Rx FIFO disabled), this field flags the interrupt for MB0. If the Rx FIFO is enabled, this bit is used to trigger the clear FIFO operation. This operation empties FIFO contents. Before performing this operation the CPU must service all FIFO related IFLAGs. When MCR[DMA] is enabled this operation also clears the BUF5I flag and consequently aborts the DMA request. The clear FIFO operation occurs when the CPU writes 1 in BUF0I. It is only allowed in Freeze mode and is blocked by hardware in other conditions. 0b - The corresponding buffer has no occurrence of successfully completed transmission or reception when MCR[RFEN]=0. 1b - The corresponding buffer has successfully completed transmission or reception when MCR[RFEN]=0.

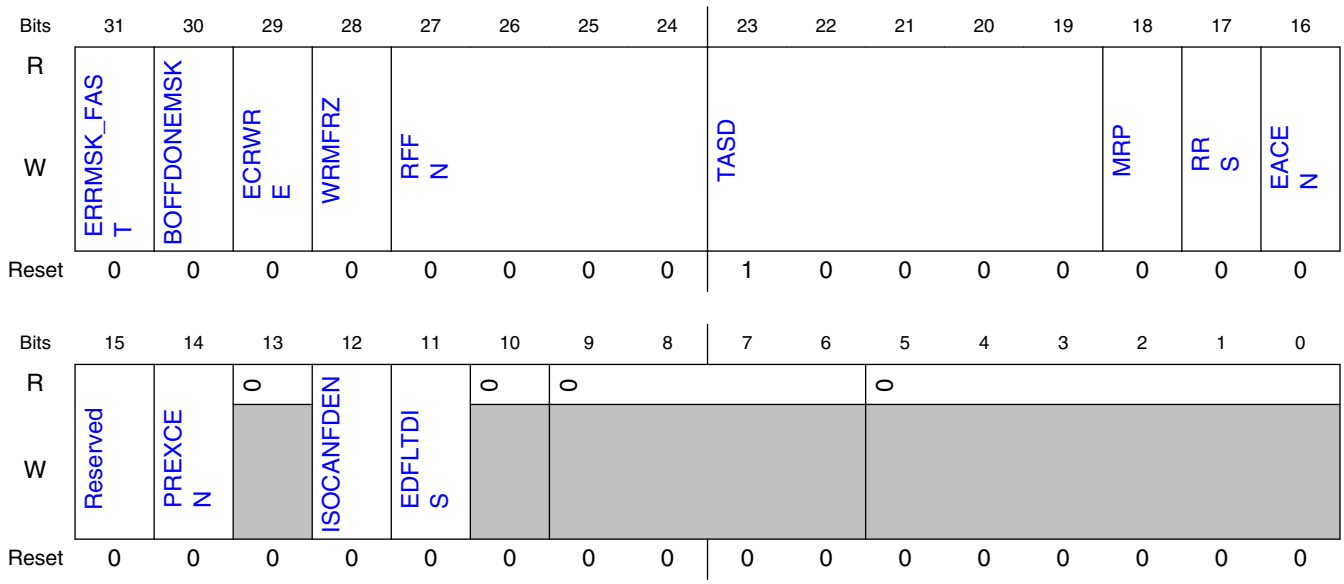
11.8.5.2.14 Control 2 Register (CTRL2)

11.8.5.2.14.1 Offset

Register	Offset
CTRL2	34h

11.8.5.2.14.2 Function

This register complements Control1 register, providing control bits for memory write access in Freeze mode, for extending FIFO filter quantity, and to adjust the operation of internal FlexCAN processes like matching and arbitration.



The contents of this register are not affected by soft reset.

This table shows how the Rx FIFO filter structure is determined by the value of CTRL2[RFFN]. See the CTRL2[RFFN] field description for more information.

Table 11-178. Rx FIFO filter: possible structures

RFFN[3:0]	Number of Rx FIFO filter elements	Message buffers occupied by Rx FIFO and ID filter table	Remaining available mailboxes	Rx FIFO ID filter table elements affected by Rx individual masks	Rx FIFO ID filter table elements affected by Rx FIFO global mask
0h	8	MB 0-7	MB 8-63	Elements 0-7	none
1h	16	MB 0-9	MB 10-63	Elements 0-9	Elements 10-15

11.8.5.2.14.3 Diagram

11.8.5.2.14.4 Fields

Field	Function
31 ERRMSK_FAST	Error Interrupt Mask for errors detected in the data phase of fast CAN FD frames This bit provides a mask for the ERRINT_FAST interrupt in ESR1 register. 0b - ERRINT_FAST error interrupt disabled. 1b - ERRINT_FAST error interrupt enabled.
30 BOFFDONEMSK	Bus Off Done Interrupt Mask This bit provides a mask for the bus off done interrupt in ESR1 register. 0b - Bus off done interrupt disabled. 1b - Bus off done interrupt enabled.
29 ECRWRE	Error-correction Configuration Register Write Enable This bit enables the MECR register to be updated. This bit is automatically set to 0 if the protocol described in Detection and correction of memory errors is not followed. 0b - Disable update. 1b - Enable update.
28 WRMFRZ	Write-Access To Memory In Freeze Mode Enable unrestricted write access to FlexCAN memory in Freeze mode. This bit can only be written in Freeze mode and has no effect out of Freeze mode. MCR[RFEN] must not be set during FlexCAN memory initialization. 0b - Maintain the write access restrictions. 1b - Enable unrestricted write access to FlexCAN memory.
27-24 RFFN	Number Of Rx FIFO Filters

Table continues on the next page...

Field	Function
	This 4-bit field defines the number of Rx FIFO filters, as shown in Table 11-178. The maximum selectable number of filters is determined by the chip. This field can only be written in Freeze mode as it is blocked by hardware in other modes. This field must not be programmed with values that cause the number of message buffers occupied by Rx FIFO and ID Filter to exceed the number of mailboxes present, as defined by MCR[MAXMB]. **NOTE:** Each group of eight filters occupies a memory space equivalent to two message buffers, which means that the more filters are implemented the fewer mailboxes will be available. Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value corresponding to a number of filters not greater than the number of available memory words, which can be calculated as follows: (SETUP_MB - 6) × 4 where SETUP_MB is the smaller of the parameter NUMBER_OF_MB and MCR[MAXMB]. The number of remaining mailboxes available will be: (SETUP_MB - 8) - (RFFN × 2) If the number of Rx FIFO filters programmed through RFFN exceeds the SETUP_MB value (memory space available), then the exceeding ones will not be functional. **NOTE:** • The number of the last remaining available mailboxes is defined by the smaller of NUMBER_OF_MB minus 1 and MCR[MAXMB]. • If Rx Individual Mask registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.
23-19 TASD	Tx Arbitration Start Delay This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. See Tx arbitration start delay for more details. This field can be written only in Freeze mode because it is blocked by hardware in other modes.
18 MRP	Mailboxes Reception Priority If this bit is set the matching process starts from the mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0b - Matching starts from Rx FIFO and continues on mailboxes. 1b - Matching starts from mailboxes and continues on Rx FIFO.
17 RRS	Remote Request Storing If this bit is asserted a remote request frame is submitted to a matching process and stored in the corresponding message buffer in the same fashion as a data frame. No automatic remote response frame will be generated. If this bit is negated the remote request frame is submitted to a matching process and an automatic remote response frame is generated if a message buffer with CODE = 1010b is found with the same ID. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0b - Remote response frame is generated. 1b - Remote request frame is stored.
16 EACEN	Entire Frame Arbitration Field Comparison Enable For Rx Mailboxes This bit controls the comparison of IDE and RTR bits within Rx mailbox filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0b - Rx mailbox filter's IDE bit is always compared and RTR is never compared despite mask bits. 1b - Enables the comparison of both Rx mailbox filter's IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply.
15	Reserved

Table continues on the next page...

Field	Function
—	When writing to this field, always write the reset value.
14 PREXCEN	Protocol Exception Enable This bit enables the protocol exception feature. This field is writable only in Freeze mode. **NOTE:** See Protocol exception event in the CAN Protocol standard (ISO 11898-1) for details. 0b - Protocol exception is disabled. 1b - Protocol exception is enabled.
13 —	Reserved
12 ISOCANFDEN	ISO CAN FD Enable This field enables the CAN FD protocol according to ISO specification (ISO 11898-1) (see CAN FD ISO compliance). This field is writable only in Freeze mode. **NOTE:** FlexCAN is able to transmit FD frame format according to CAN Protocol standard (ISO 11898-1). 0b - FlexCAN operates using the non-ISO CAN FD protocol. 1b - FlexCAN operates using the ISO CAN FD protocol (ISO 11898-1).
11 EDFLTDIS	Edge Filter Disable This bit disables the edge filter used during the bus integration state. When the Edge Filter is enabled, two consecutive nominal time quanta with dominant bus state are required to detect an edge that causes synchronization. When synchronization occurs, the counting of the sequence of eleven consecutive recessive bits is restarted. The edge filter prevents the dominant pulses that are shorter than a nominal bit time (present during the data phase of an FD frame) from being mistaken for an idle condition. This field is writable only in Freeze mode. **NOTE:** See Bus Integration state in the CAN Protocol standard (ISO 11898-1) for details. 0b - Edge filter is enabled 1b - Edge filter is disabled
10 —	Reserved
9-6 —	Reserved
5-0 —	Reserved

11.8.5.2.15 Error and Status 2 Register (ESR2)

11.8.5.2.15.1 Offset

Register	Offset
ESR2	38h

11.8.5.2.15.2 Function

This register reports some general status information.

11.8.5.2.15.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0									LPTM						
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0	VPS	IMB	0												
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.8.5.2.15.4 Fields

Field	Function
31-23 —	Reserved
22-16 LPTM	Lowest Priority Tx Mailbox If ESR2[VPS] is asserted, this field indicates the lowest number inactive mailbox (see the ESR2[IMB] bit description). If there is no inactive mailbox then the mailbox indicated depends on the value of CTRL1[LBUF]. If CTRL1[LBUF] is negated, then the mailbox indicated is the one that has the greatest arbitration value (see Highest-priority mailbox first). If CTRL1[LBUF] is asserted then the mailbox indicated is the highest number active Tx mailbox. If a Tx mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its mailbox number.
15 —	Reserved
14 VPS	Valid Priority Status This bit indicates whether ESR2[IMB] and ESR2[LPTM] contents are currently valid or not. It is asserted upon every complete Tx arbitration process unless the CPU writes to Control and Status word of a mailbox that has already been scanned, that is, it is behind Tx Arbitration Pointer, during the Tx arbitration process. If there is no inactive mailbox and only one Tx mailbox that is being transmitted then VPS is not asserted. This bit is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any mailbox. **NOTE:** ESR2[VPS] is not affected by any CPU write into Control Status (C/S) of an MB that is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of an MB that is being transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked. 0b - Contents of IMB and LPTM are invalid. 1b - Contents of IMB and LPTM are valid.
13 IMB	Inactive Mailbox

Table continues on the next page...

Field	Function
	If ESR2[VPS] is asserted, this bit indicates whether there is any inactive mailbox (CODE field is either 1000b or 0b). This bit is asserted in the following cases: • During arbitration, if an ESR2[LPTM] is found and it is inactive. • If ESR2[IMB] is not asserted and a frame is transmitted successfully. This bit is always cleared in start of arbitration (see Arbitration process). **NOTE:** ESR2[LPTM] mechanism has the following behavior: if an MB is successfully transmitted and ESR2[IMB]=0 (no inactive mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM]. 0b - If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive mailbox. 1b - If ESR2[VPS] is asserted, there is at least one inactive mailbox. LPTM content is the number of the first one.
12-0 —	Reserved

11.8.5.2.16 CRC Register (CRCR)

11.8.5.2.16.1 Offset

Register	Offset
CRCR	44h

11.8.5.2.16.2 Function

This register provides information about the CRC of transmitted messages for non-FD messages. This register only reports the 15 low order bits of CRC calculations for messages in CAN FD format that require either 17 or 21 bits. For CAN FD format frames, the FDCRC register must be used. This register is updated at the same time the Tx interrupt flag is asserted.

NOTE

See CRC sequence calculation in the CAN Protocol standard (ISO 11898-1) for details.

11.8.5.2.16.3 Diagram

11.8.5.2.16.4 Fields

Field	Function
31-23 —	Reserved
22-16 MBCRC	CRC Mailbox This field indicates the number of the mailbox corresponding to the value in CRCR[TXCRC] field.
15 —	Reserved
14-0 TXCRC	Transmitted CRC value This field indicates the CRC value of the last transmitted message for non-FD frames. For FD frames, CRC value is reported in FDCRC register.

11.8.5.2.17 Rx FIFO Global Mask Register (RXFGMASK)

11.8.5.2.17.1 Offset

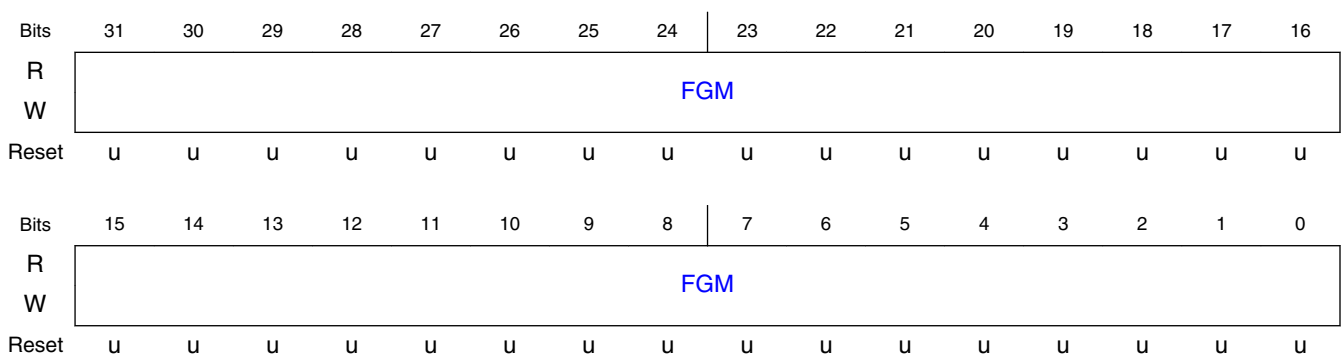
Register	Offset
RXFGMASK	48h

11.8.5.2.17.2 Function

This register is located in RAM.

If Rx FIFO is enabled, RXFGMASK is used to mask the Rx FIFO ID filter table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.



The following table shows how the FGM bits correspond to each IDAF field.

Table 11-179. Correspondence of Rx FIFO global mask bits to IDF fields

Rx FIFO ID filter table elements format (MCR[IDAM])	Identifier acceptance filter fields					
	RTR	IDE	RXIDA	RXIDB [1]	RXIDC [2]	Reserved
A	FGM[31]	FGM[30]	FGM[29:1]	—	—	FGM[0]
B	FGM[31], FGM[15]	FGM[30], FGM[14]	—	FGM[29:16], FGM[13:0]		—
C	—	—		—	FGM[31:24], FGM[23:16], FGM[15:8], FGM[7:0]	

1. If MCR[IDAM] is equivalent to format B, only the fourteen most significant bits of the identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] is equivalent to format C, only the eight most significant bits of the identifier of the incoming frame are compared with the Rx FIFO filter.

11.8.5.2.17.3 Diagram

11.8.5.2.17.4 Fields

Field	Function
31-0 FGM	Rx FIFO Global Mask Bits These bits mask the ID filter table elements bits in a perfect alignment. 0b - The corresponding bit in the filter is "don't care." 1b - The corresponding bit in the filter is checked.

11.8.5.2.18 Rx FIFO Information Register (RXFIR)

11.8.5.2.18.1 Offset

Register	Offset
RXFIR	4Ch

11.8.5.2.18.2 Function

RXFIR provides information on Rx FIFO.

This register is the port through which the CPU accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO. Also, its output is updated whenever the output of the Rx FIFO is updated with the next message. See Rx FIFO for instructions on reading this register.

NOTE

RXFIR can be written only during memory initialization, due to the error code correction (ECC) feature. In every other case the register is read-only.

11.8.5.2.18.3 Diagram

11.8.5.2.18.4 Fields

Field	Function
31-9 —	Reserved
8-0	Identifier Acceptance Filter Hit Indicator

Field	Function
IDHIT	This field indicates which Identifier Acceptance filter was hit by the received message that is in the output of the Rx FIFO. If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only when IFLAG1[BUF5I] is asserted.

11.8.5.2.19 CAN Bit Timing Register (CBT)

11.8.5.2.19.1 Offset

Register	Offset
CBT	50h

11.8.5.2.19.2 Function

This register is an alternative way to store the CAN bit timing variables described in CTRL1 register. EPRESDIV, EPROPSEG, EPSEG1, EPSEG2, and ERJW are extended versions of PRESDIV, PROPSEG, PSEG1, PSEG2, and RJW fields respectively.

The BTF bit selects the use of the timing variables defined in this register.

The contents of this register are not affected by soft reset.

NOTE

The CAN bit variables in CTRL1 and in CBT are stored in the same register.

NOTE

When the CAN FD feature is enabled (MCR[FDEN] is set), always set CBT[BTF].

NOTE

The user must ensure bit time settings and protocol engine tolerance are in compliance with the CAN Protocol standard (ISO 11898-1).

11.8.5.2.19.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	EPROPSEG						EPSEG1					EPSEG2				
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.8.5.2.19.4 Fields

Field	Function
31 BTF	Bit Timing Format Enable Enables the use of extended CAN bit timing fields EPRESDIV, EPROPSEG, EPSEG1, EPSEG2. and ERJW replacing the CAN bit timing variables defined in CTRL1 register. This field can be written in Freeze mode only. 0b - Extended bit time definitions disabled. 1b - Extended bit time definitions enabled.
30-21 EPRESDIV	Extended Prescaler Division Factor This 10-bit field defines the ratio between the PE clock frequency and the serial clock (Sclock) frequency when CBT[BTF] is asserted, otherwise it has no effect. It extends the CTRL1[PRESDIV] value range. The Sclock period defines the time quantum of the CAN protocol. For the reset value, the Sclock frequency is equal to the PE clock frequency (see Protocol timing). This field can be written only in Freeze mode because it is blocked by hardware in other modes. Sclock frequency = PE clock frequency / (EPRESDIV + 1)
20-16 ERJW	Extended Resync Jump Width This 5-bit field defines the maximum number of time quanta that a bit time can be changed by one re-synchronization when CBT[BTF] bit is asserted, otherwise it has no effect. It extends the CTRL1[RJW] value range. One time quantum is equal to the Sclock period. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Resync Jump Width = ERJW + 1.
15-10 EPROPSEG	Extended Propagation Segment This 6-bit field defines the length of the propagation segment in the bit time when CBT[BTF] bit is asserted, otherwise it has no effect. It extends the CTRL1[PROPSEG] value range. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Propagation Segment Time = (EPROPSEG + 1) × Time-Quanta. Time-Quantum = one Sclock period.
9-5 EPSEG1	Extended Phase Segment 1 This 5-bit field defines the length of phase segment 1 in the bit time when CBT[BTF] bit is asserted, otherwise it has no effect. It extends the CTRL1[PSEG1] value range. This field can be written only in Freeze mode because it is blocked by hardware in other modes.

Table continues on the next page...

Field	Function
	Phase Buffer Segment 1 = (EPSEG1 + 1) × Time-Quanta. Time-Quantum = one Sclock period.
4-0 EPSEG2	Extended Phase Segment 2 This 5-bit field defines the length of phase segment 2 in the bit time when CBT[BTF] bit is asserted, otherwise it has no effect. It extends the CTRL1[PSEG2] value range. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Phase Buffer Segment 1 = (EPSEG2 + 1) × Time-Quanta. Time-Quantum = one Sclock period.

11.8.5.2.20 Rx Individual Mask Registers (RXIMR0 - RXIMR63)

11.8.5.2.20.1 Offset

For n = 0 to 63:

Register	Offset
RXIMRn	880h + (n × 4h)

11.8.5.2.20.2 Function

The RX Individual Mask registers are used to store the acceptance masks for ID filtering in Rx MBs and the Rx FIFO.

When the Rx FIFO is disabled (MCR[RFEN] bit is negated), an individual mask is provided for each available Rx mailbox on a one-to-one correspondence. When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), an individual mask is provided for each Rx FIFO ID filter table element on a one-to-one correspondence depending on the setting of CTRL2[RFFN] (see Rx FIFO).

RXIMR0 stores the individual mask associated with either MB0 or ID filter table element 0, RXIMR1 stores the individual mask associated with either MB1 or ID filter table element 1, and so on.

RXIMR registers can only be accessed by the CPU when the module is in Freeze mode; otherwise, they are blocked by hardware. These registers are not affected by reset. They are located in RAM and must be explicitly initialized prior to any reception.

It is possible for the RXIMR memory region to be accessed as general purpose memory. See Bus interface for more information.

11.8.5.2.20.3 Diagram

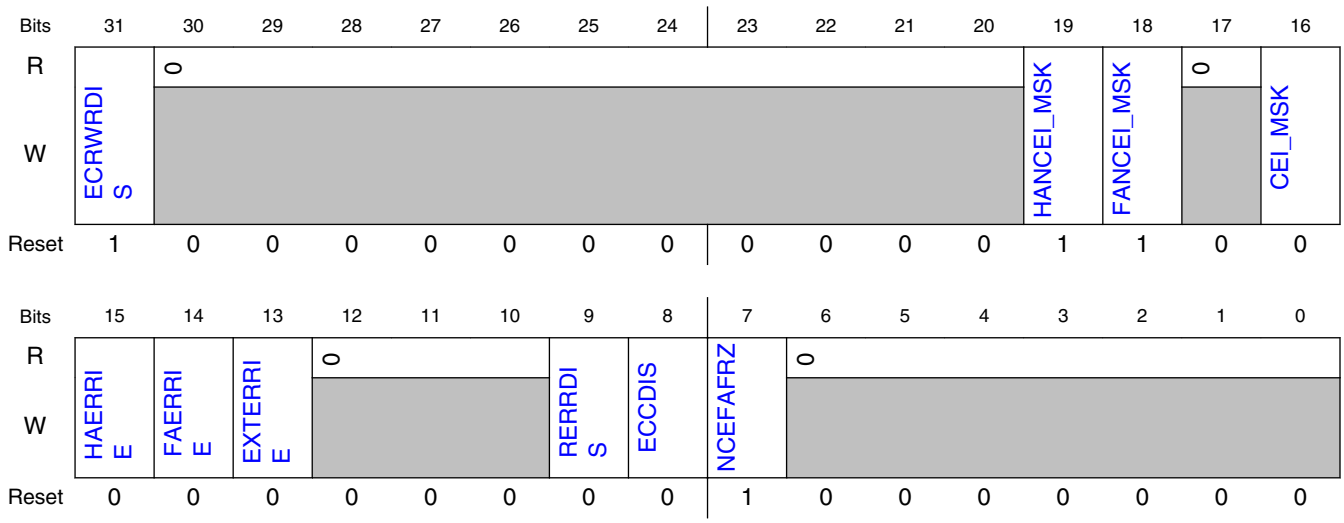
11.8.5.2.20.4 Fields

Field	Function
31-0 MI	Individual Mask Bits Each individual mask bit masks the corresponding bit in both the mailbox filter and Rx FIFO ID filter table element in distinct ways. For mailbox filters, see the RXMGMASK register description. For Rx FIFO ID filter table elements, see the RXFGMASK register description. 0b - The corresponding bit in the filter is "don't care." 1b - The corresponding bit in the filter is checked.

11.8.5.2.21 Memory Error Control Register (MECR)

11.8.5.2.21.1 Offset

Register	Offset
MECR	AE0h



11.8.5.2.21.2 Function

This register contains control bits for memory error detection and correction (ECC).

NOTE

When bit CTRL2[ECRWRE] is 0, writes in this register are blocked, except in the ECRWRDIS bit.

11.8.5.2.21.3 Diagram

11.8.5.2.21.4 Fields

Field	Function
31 ECRWRDIS	Error Configuration Register Write Disable Disables writes on this register. This bit is automatically set to 1 (disabled) when CTRL2[ECRWRE] is enabled. The protocol described in section Detection and correction of memory errors must be followed. 0b - Write is enabled. 1b - Write is disabled.
30-20 —	Reserved
19 HANCEI_MSK	Host Access With Non-Correctable Errors Interrupt Mask Enables the interrupt in case of non-correctable errors detected in memory reads issued by the host (CPU). 0b - Interrupt is disabled. 1b - Interrupt is enabled.
18 FANCEI_MSK	FlexCAN Access With Non-Correctable Errors Interrupt Mask Enables the interrupt in case of non-correctable errors detected in memory reads issued by the FlexCAN internal processes. 0b - Interrupt is disabled. 1b - Interrupt is enabled.
17 —	Reserved
16 CEI_MSK	Correctable Errors Interrupt Mask Enables the interrupt in case of correctable errors detected in memory reads issued by the host or FlexCAN internal processes. 0b - Interrupt is disabled.

Table continues on the next page...

Field	Function
	1b - Interrupt is enabled.
15 HAERRIE	Host Access Error Injection Enable Enables the injection of errors only in memory reads issued by the host (CPU). 0b - Injection is disabled. 1b - Injection is enabled.
14 FAERRIE	FlexCAN Access Error Injection Enable Enables the injection of errors only in memory reads issued by the FlexCAN internal processes. 0b - Injection is disabled. 1b - Injection is enabled.
13 EXTERRIE	Extended Error Injection Enable Memory accesses performed by internal FlexCAN processes are 64-bit. This bit extends the error injection on 32-bit memory accesses to the complementary 32-bit word using the same 32-bit error injection data and parity words. See Error Injection Data Pattern Register (ERRIDPR) and Error Injection Parity Pattern Register (ERRIPPR). 0b - Error injection is applied only to the 32-bit word. 1b - Error injection is applied to the 64-bit word.
12-10 —	Reserved
9 RERRDIS	Error Report Disable Disables the update of the error report registers. The update of error-related flags and the generation of bus transfer errors are still active. **NOTE:** When reading the report registers, this bit must be set to assure coherence on the consecutive register reads. 0b - Enable updates of the error report registers. 1b - Disable updates of the error report registers.
8 ECCDIS	Error Correction Disable Disables completely the memory detection and correction mechanism. Besides disabling the error report mechanism, it also stops the update of the error-related flags and generation of bus transfer errors. The parity bits continue being calculated and written into memory on write transactions. 0b - Enable memory error correction. 1b - Disable memory error correction.
7 NCEFAFRZ	Non-Correctable Errors In FlexCAN Access Put Device In Freeze Mode Determines the response when a non-correctable error is detected in a memory read performed by FlexCAN internal processes. In this case, entering Freeze mode prevents corrupted data from being treated as valid by FlexCAN internal processes. 0b - Keep normal operation. 1b - Put FlexCAN in Freeze mode (see section "Freeze mode").
6-0 —	Reserved

11.8.5.2.22 Error Injection Address Register (ERRIAR)

11.8.5.2.22.1 Offset

Register	Offset
ERRIAR	AE4h

11.8.5.2.22.2 Function

This register holds the address where error is to be injected.

Use the following table to convert from the memory map address to the location in the physical FlexCAN RAM (where pairs of values are provided, the first is the address for MCR[FDEN] negated, the second is for MCR[FDEN] asserted):

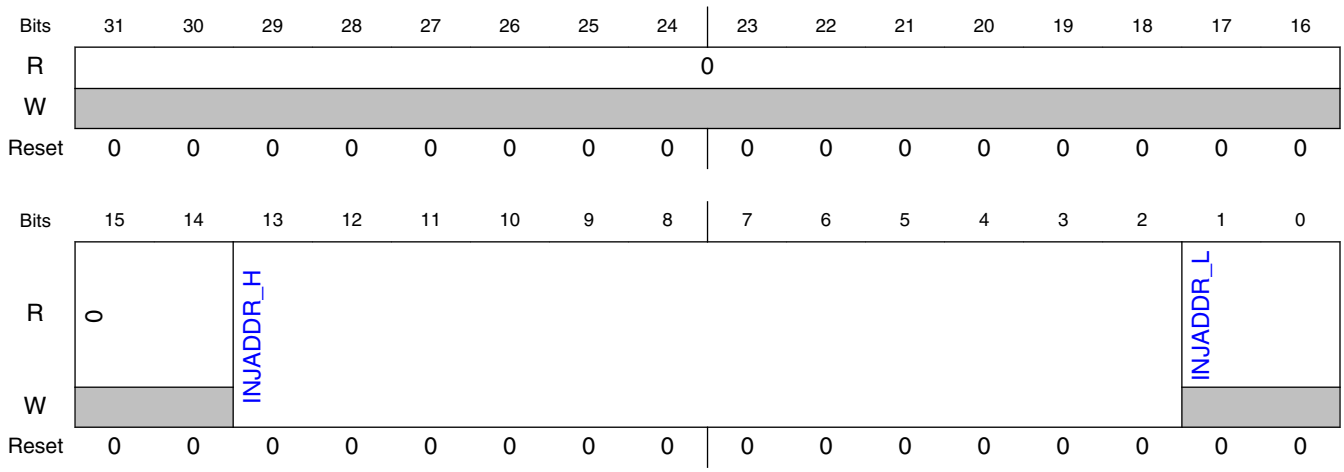


Table 11-180. Error injection address for Classical CAN format

RAM contents	Injection address	Memory map
FlexCAN registers	Not mapped	—
MBs	0000h	0080h
Reserved	—	0480h
RXIMRs	0400h	0880h
Reserved	—	0980h
RXFIR_0	0500h	0A80h
RXFIR_1	0504h	0A84h
RXFIR_2	0508h	0A88h

11.8.5.2.25 Error Report Address Register (RERRAR)

11.8.5.2.25.1 Offset

Register	Offset
RERRAR	AF0h

11.8.5.2.25.2 Function

Reports the address used for an access in which an error (correctable or non-correctable) was detected, and also reports the identification of the source of that access.

This address is always reported using a 32-bit alignment. Non-aligned accesses (ERRADDR[1:0] non-0) are reported with the address aligned and data is reported in RERRDR accordingly shifted. In case of errors detected in accesses larger than 32-bit (as performed by FlexCAN internal processes), the address of the 32-bit word which the error was detected is reported. In case of errors detected in more than one 32-bit word, only the least significant address is reported.

Table 11-181. Source of memory access

SAID[2:0]	Error during...

31-0 RDATA	Raw data word read from memory with error

11.8.5.2.27 Error Report Syndrome Register (RERRSYNR)

11.8.5.2.27.1 Offset

Register	Offset
RERRSYNR	AF8h

11.8.5.2.27.2 Function

Holds the syndrome detected in a memory read with error. It also reports the bytes which were read in this 32-bit read transaction.

Each SYNDn field indicates the type of error and which bit in byte (n) is affected by the error. (SYND3 corresponds to the most significant byte in the data word read from memory; SYND0 corresponds to the least significant.)

Table 11-182. Syndrome definition

SYNDn (hex)	Type	Bit affected
00	—	none (no error)
01	Code	0

Table continues on the next page...

Table 11-182. Syndrome definition (continued)

SYNDn (hex)	Type	Bit affected
02	Code	1
04	Code	2
07	Data	5
08	Code	3
0E	Data	7
10	Code	4
13	Data	2
15	Data	6
16	Data	1
19	Data	3
1A	Data	4
1C	Data	0
06	—	All-zeros non-correctable error
1F	—	All-ones non-correctable error
All others	—	Non-correctable error

Each BEn field indicates which byte in the 32-bit word reported was effectively read. The syndrome bits are calculated for all bytes, even for the non-read ones. Errors detected in non-read bytes are indicated (see Error indication) and reported (see Error reporting).

11.8.5.2.27.3 Diagram

11.8.5.2.28.4 Fields

Field	Function
31-20 —	Reserved
19 HANCEIF	Host Access With Non-Correctable Error Interrupt Flag Indicates that a non-correctable error was detected in a memory read initiated by host. A bus transfer error is asserted for that access. If MECR[HANCEI_MSK] is set, the interrupt is asserted. 0b - No non-correctable errors were detected in host accesses so far. 1b - A non-correctable error was detected in a host access.
18 FANCEIF	FlexCAN Access With Non-Correctable Error Interrupt Flag Indicates that a non-correctable error was detected in a memory read initiated by FlexCAN internal processes. If MECR[FANCEI_MSK] is set, the interrupt is asserted. 0b - No non-correctable errors were detected in FlexCAN accesses so far. 1b - A non-correctable error was detected in a FlexCAN access.
17 —	Reserved
16 CEIF	Correctable Error Interrupt Flag Indicates that a correctable error was detected in a memory read. If MECR[CEI_MSK] is set, the interrupt is asserted. 0b - No correctable errors were detected so far. 1b - A correctable error was detected.
15-4 —	Reserved
3	Host Access With Non-Correctable Error Interrupt Overrun Flag

Table continues on the next page...

Field	Function
HANCEIOF	Indicates that a non-correctable error was detected in a memory read initiated by host when HANCEIF was set. No interrupt is associated with this flag. See Error indication. 0b - No overrun on non-correctable errors in host access 1b - Overrun on non-correctable errors in host access
2 FANCEIOF	FlexCAN Access With Non-Correctable Error Interrupt Overrun Flag Indicates that a non-correctable error was detected in a memory read initiated by FlexCAN internal processes when FANCEIF was set. No interrupt is associated to this flag. See Error indication. 0b - No overrun on non-correctable errors in FlexCAN access 1b - Overrun on non-correctable errors in FlexCAN access
1 —	Reserved
0 CEIOF	Correctable Error Interrupt Overrun Flag Indicates that a correctable error was detected in a memory read when CEIF was set. No interrupt is associated to this flag. See Error indication. 0b - No overrun on correctable errors 1b - Overrun on correctable errors

11.8.5.2.29 CAN FD Control Register (FDCTRL)

11.8.5.2.29.1 Offset

Register	Offset
FDCTRL	C00h

11.8.5.2.29.2 Function

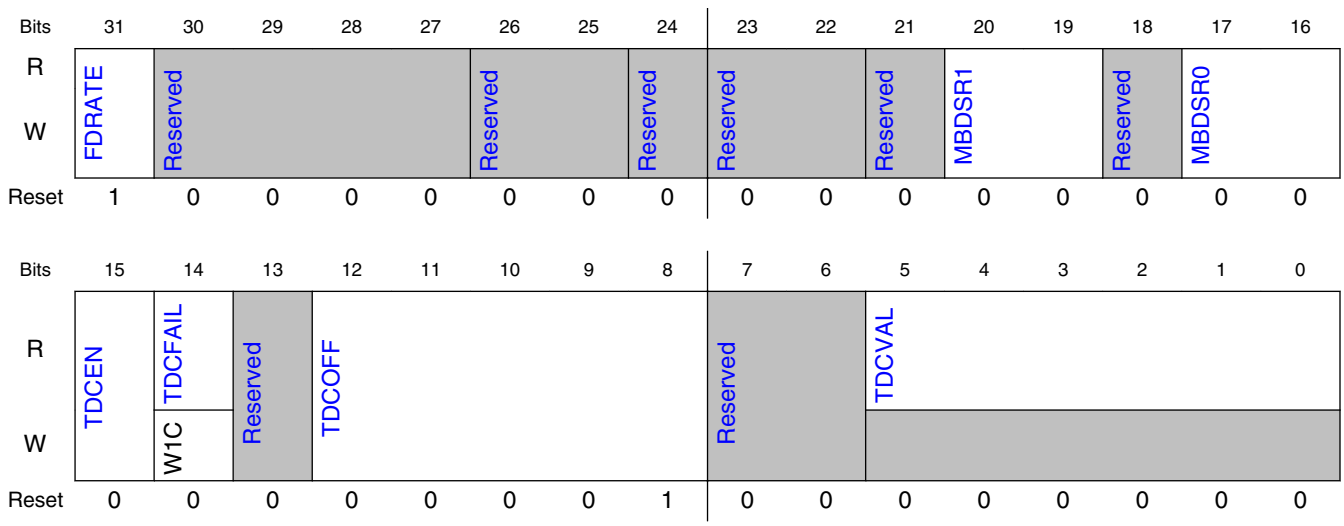
This register contains control bits for the CAN FD operation. It also defines the data size of message buffers allocated in different partitions of RAM (memory blocks) as described in the table below.

When an 8-byte payload is selected:

- Block R0 allocates MB0 to MB31.
- Block R1 allocates MB32 to MB63.

When a payload larger than 8 bytes is selected, the maximum number of MBs in a block is limited as described below:

Table 11-183. Number of message buffers



Payload size	Maximum number of message buffers per RAM block
8 bytes	32
16 bytes	21
32 bytes	12
64 bytes	7

NOTE

One memory block fits exactly 32 MBs with an 8-byte payload. For other possible payload sizes, empty memory may exist between the last MB in a block and the beginning of the next block. This empty memory corresponds to less than one MB, and must not be used.

The contents of this register are not affected by soft reset.

11.8.5.2.29.3 Diagram

11.8.5.2.29.4 Fields

Field	Function
31 FDRATE	Bit Rate Switch Enable This bit enables the effect of the Bit Rate Switch (BRS bit) during the data phase of Tx messages. The CPU can write this bit any time. However, its effect turns active only when the CAN bus is in Wait for Bus Idle, Bus Idle, or Bus Off state, or when the current frame under reception or transmission reaches the interframe space.

Table continues on the next page...

Field	Function
	By negating FDCTRL[FDRATE], the CPU can force all bits in CAN FD messages to be transmitted in nominal bit rate, no matter what the value is in the BRS bit of the Tx MBs. 0b - Transmit a frame in nominal rate. The BRS bit in the Tx MB has no effect. 1b - Transmit a frame with bit rate switching if the BRS bit in the Tx MB is recessive.
30-27 —	Reserved
26-25 —	Reserved
24 —	Reserved
23-22 —	Reserved
21 —	Reserved
20-19 MBDSR1	Message Buffer Data Size for Region 1 This two-bit field selects the data size (8, 16, 32, or 64 bytes) for region R1 of message buffers allocated in RAM. It can be written in Freeze mode only. 00b - Selects 8 bytes per message buffer. 01b - Selects 16 bytes per message buffer. 10b - Selects 32 bytes per message buffer. 11b - Selects 64 bytes per message buffer.
18 —	Reserved
17-16 MBDSR0	Message Buffer Data Size for Region 0 This two-bit field selects the data size (8, 16, 32, or 64 bytes) for region R0 of message buffers allocated in RAM. It can be written in Freeze mode only. 00b - Selects 8 bytes per message buffer. 01b - Selects 16 bytes per message buffer. 10b - Selects 32 bytes per message buffer. 11b - Selects 64 bytes per message buffer.
15 TDCEN	Transceiver Delay Compensation Enable This bit can be used to enable and disable the TDC feature. It can be written in Freeze mode only. **NOTE:** See Transmitter delay compensation in the CAN Protocol standard (ISO 11898-1) for details. **NOTE:** TDC must be disabled when Loop Back mode is enabled (see CTRL1[LPB]). 0b - TDC is disabled 1b - TDC is enabled
14 TDCFAIL	Transceiver Delay Compensation Fail This bit indicates when the Transceiver Delay Compensation (TDC) mechanism is out of range, unable to compensate the transceiver's loop delay and successfully compare the delayed received bits to the transmitted ones (see Transceiver delay compensation). TDCFAIL sets in the first time FlexCAN detects the out of range condition. The CPU needs to write one to clear it. 0b - Measured loop delay is in range. 1b - Measured loop delay is out of range.

Table continues on the next page...

Field	Function
13 —	Reserved
12-8 TDCOFF	Transceiver Delay Compensation Offset This bit field contains the offset value to be added to the measured transceiver's loop delay in order to define the position of the delayed comparison point when bit rate switching is active. See Transceiver delay compensation for more details on how the loop delay measurement is performed. TDCOFF can be written in Freeze mode only. Its value can be defined in Protocol Engine (PE) Clock periods (CANCLK, see Protocol timing for more details), and must be selected to be smaller than the CAN bit duration in the data bit rate for proper operation. **NOTE:** It is not recommended to have TDCOFF equal to zero.
7-6 —	Reserved
5-0 TDCVAL	Transceiver Delay Compensation Value This register contains the value of the transceiver loop delay measured from the transmitted EDL to R0 transition edge to the respective received one added to the TDCOFF value specified in the FDCTRL register. This value is an integer multiple of the Protocol Engine (PE) Clock period (CANCLK). See Protocol timing for more details on how the loop delay measurement is performed.

11.8.5.2.30 CAN FD Bit Timing Register (FDCBT)

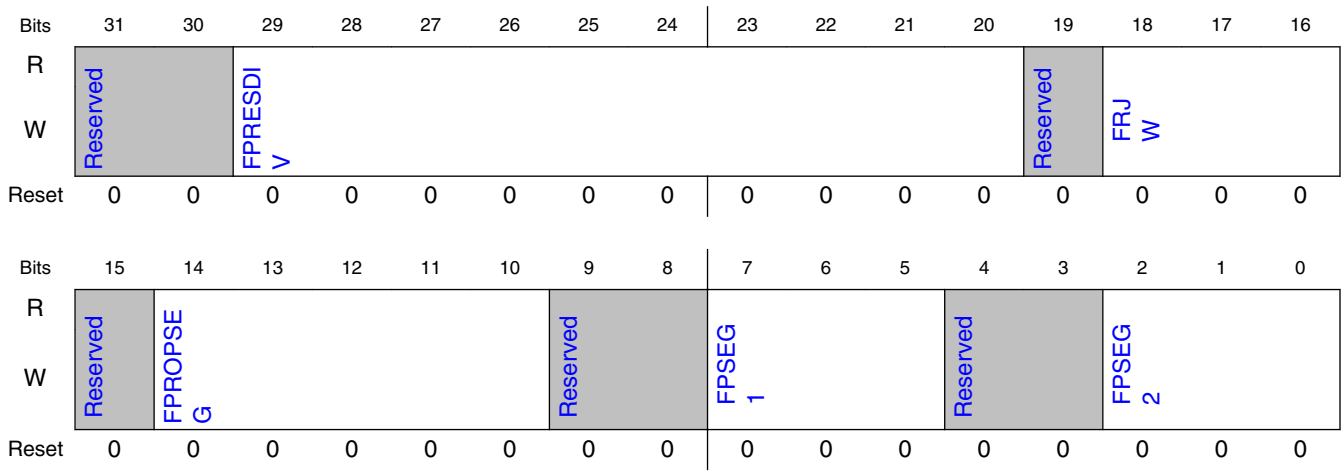
11.8.5.2.30.1 Offset

Register	Offset
FDCBT	C04h

11.8.5.2.30.2 Function

This register stores the CAN bit timing variables used in the data phase of CAN FD messages when the FDCTRL[FDRATE] is set, compatible with CAN FD specification. FPRESDIV, FPROPSEG, FPSEG1, FPSEG2, and FRJW are used to define the time quantum duration, the number of time quanta per CAN bit, and the sample point position for the data bit rate portion of a CAN FD message with the BRS bit set.

The contents of this register are not affected by soft reset.



NOTE

The sum of the Fast Propagation Segment (FPROPSEG) and Fast Phase Segment 1 (FPSEG1) must be at least two time quanta.

NOTE

The user must ensure bit time settings and protocol engine tolerance are in compliance with the CAN Protocol standard (ISO 11898-1).

11.8.5.2.30.3 Diagram

11.8.5.2.30.4 Fields

Field	Function
31-30 —	Reserved
29-20 FPRESDIV	Fast Prescaler Division Factor This 10-bit field defines the ratio between the PE clock frequency and the serial clock (Sclock) frequency in the data bit rate portion of a CAN FD message with the BRS bit set. The Sclock period defines the time quantum of the CAN FD protocol for the data bit rate. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Sclock frequency = PE clock frequency / (FPRESDIV + 1). **NOTE:** To minimize errors when processing FD frames, use the same value for FPRESDIV and PRESDIV (in CBT or CTRL1). For more details see the first NOTE in section CAN FD frames.
19 —	Reserved
18-16 FRJW	Fast Resync Jump Width This 3-bit field defines the maximum number of time quanta that a bit time can be changed by one resynchronization in the data bit rate portion of a CAN FD message with the BRS bit set. One time quantum is equal to the Sclock period. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Resync Jump Width = FSJW + 1.
15	Reserved

Table continues on the next page...

Field	Function
—	
14-10 FPROPSEG	Fast Propagation Segment This 5-bit field defines the length of the propagation segment in the bit time in the data bit rate portion of a CAN FD message with the BRS bit set. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Propagation Segment Time = FPROPSEG × Time-Quanta. Time-Quantum = one Sclock period.
9-8 —	Reserved
7-5 FPSEG1	Fast Phase Segment 1 This 3-bit field defines the length of phase segment 1 in the bit time in the data bit rate portion of a CAN FD message with the BRS bit set. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Phase Segment 1 = (FPSEG1 + 1) × Time-Quanta. Time-Quantum = one Sclock period.
4-3 —	Reserved
2-0 FPSEG2	Fast Phase Segment 2 This 3-bit field defines the length of phase segment 2 in the data bit rate portion of a CAN FD message with the BRS bit set. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Phase Segment 2 = (FPSEG2 + 1) × Time-Quanta. Time-Quantum = one Sclock period.

11.8.5.2.31 CAN FD CRC Register (FDCRC)

11.8.5.2.31.1 Offset

Register	Offset
FDCRC	C08h

11.8.5.2.31.2 Function

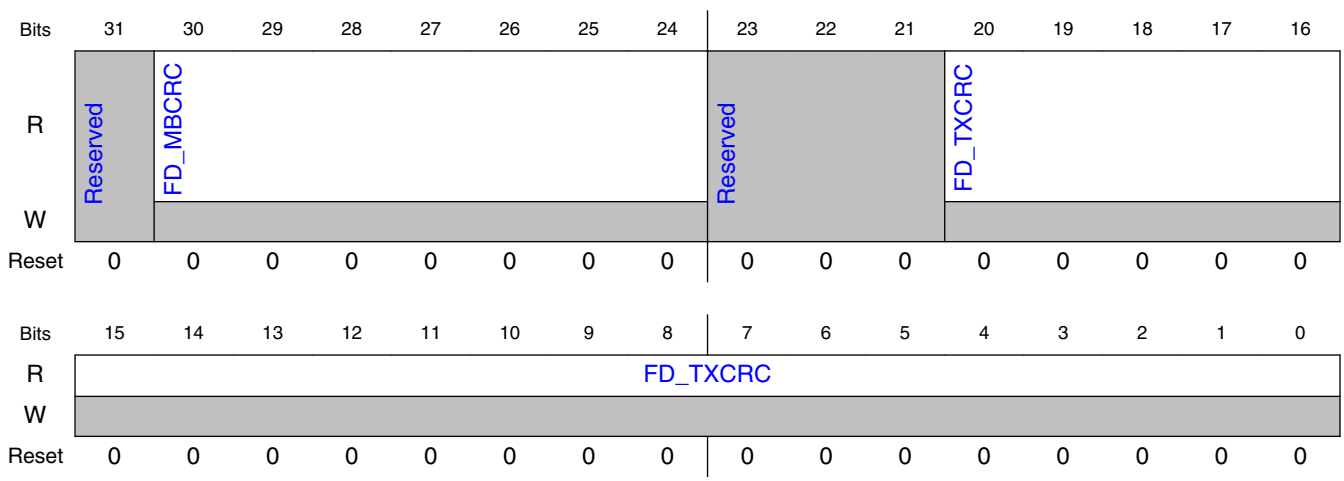
This register provides information about the CRC of transmitted messages.

FlexCAN uses different CRC polynomials for different frame formats, as shown below.

The CRC_15 polynomial is used for all frames in CAN format. The CRC_17 polynomial is used for frames in CAN FD format with a DATA FIELD up to sixteen bytes. The CRC_21 polynomial is used for frames in CAN FD format with a DATA FIELD longer than sixteen bytes. Each polynomial shown below results in a Hamming distance of 6. This register is updated at the same time the Tx Interrupt flag is asserted.

$$CRC_15 = C599h: \ (x^{15} + x^{14} + x^{10} + x^{8} + x^{7} + x^{4} + x^{3} + 1)$$

$$CRC_17 = 3685Bh: \ (x^{17} + x^{16} + x^{14} + x^{13} + x^{11} + x^{6} + x^{4} + x^{3} + x^{1} + 1)$$



$$CRC_21 = 302899h: \ (x^{21} + x^{20} + x^{13} + x^{11} + x^{7} + x^{4} + x^{3} + 1)$$

Figure 11-143. CRC polynomial used on CAN frame

NOTE

See CRC sequence calculation in the CAN Protocol standard (ISO 11898-1) for details.

11.8.5.2.31.3 Diagram

11.8.5.2.31.4 Fields

Field	Function
31 —	Reserved
30-24 FD_MBCRC	CRC Mailbox Number for FD_TXCRC This field indicates the number of the mailbox corresponding to the value in the FD_TXCRC field, for both FD and non-FD frames. It reports the same information as in CRCR[MBCRC].
23-21 —	Reserved

Table continues on the next page...

Field	Function
20-0 FD_TXCRC	Extended Transmitted CRC value This 21-bit field contains the CRC value calculated over the most recent transmitted message. Different CRC polynomials are used for different frame formats. A 15-bit polynomial, CRC_15, is used for all frames in CAN format. The second 17-bit polynomial, CRC_17, is used for frames in CAN FD format with a data field up to sixteen bytes long. The third 21-bit polynomial, CRC_21, is used for frames in CAN FD format with a data field longer than sixteen bytes. For CRC_15 and CRC_17, the 6 most significant bits and the 4 most significant bits are reported as zeros, respectively. For CRC_15, this register has the same content as CRC register.

11.8.5.3 Message buffer structure

The message buffer structure used by the FlexCAN module is represented in the following figure. Both extended (29-bit identifier) and standard (11-bit identifier) frames used in the CAN specification (Version 2.0 Part B) are represented. Each individual MB is formed by 16, 24, 40, or 72 bytes, depending on the quantity of data bytes allocated for the message payload: 8, 16, 32, or 64 data bytes, respectively.

The memory area 80h–47Fh is used by the mailboxes. When CAN FD is enabled, the exact address for each MB depends on the size of its payload. See FlexCAN memory partition for CAN FD for more detailed information.

Table 11-184. Message buffer structure — example with 64-byte payload

	31	30	29	28	27	24	23	22	21	20	19	18	17	16	15	8	7	0

EDL — Extended Data Length

This bit distinguishes between CAN format and CAN FD format frames. The EDL bit must not be set for message buffers configured to RANSWER with code field 1010b (see table below).

BRS — Bit Rate Switch

This bit defines whether the bit rate is switched inside a CAN FD format frame.

ESI — Error State Indicator

This bit indicates if the transmitting node is error active or error passive.

CODE — Message Buffer Code

This 4-bit field can be accessed (read or write) by the CPU and by the FlexCAN module itself, as part of the message buffer matching and arbitration process. The encoding is shown in Table 11-185 and Table 11-186. See Functional description for additional information.

Table 11-185. Message buffer code for Rx buffers

CODE description	Rx code BEFORE receive new frame	SRV[1]	Rx code AFTER successful reception[2]	RRS[3]	Comment
0000b: INACTIVE — MB is not active.	INACTIVE	—	—	—	MB does not participate in the matching process.
0100b: EMPTY — MB is active and empty.	EMPTY	—	FULL	—	When a frame is received successfully (after the Move-in process), the CODE field is automatically updated to FULL.
0010b: FULL — MB is full.	FULL	Yes	FULL	—	The act of reading the C/S word followed by unlocking the MB (SRV) does not make the code return to EMPTY. It remains FULL. If a

Table continues on the next page...

Table 11-185. Message buffer code for Rx buffers (continued)

CODE description	Rx code BEFORE receive new frame	SRV[1]	Rx code AFTER successful reception[2]	RRS[3]	Comment
					new frame is moved to the MB after the MB was serviced, the code still remains FULL. See Matching process for matching details related to FULL code.
		No	OVERRUN	—	If the MB is FULL and a new frame is moved to this MB before the CPU services it, the CODE field is automatically updated to OVERRUN. See Matching process for details about overrun behavior.
0110b: OVERRUN — MB is being overwritten into a full buffer.	OVERRUN	Yes	FULL	—	If the CODE field indicates OVERRUN and CPU has serviced the MB, when a new frame is moved to the MB then the code returns to FULL.
		No	OVERRUN	—	If the CODE field already indicates OVERRUN, and another new frame must be moved, the MB will be overwritten again, and the code will remain OVERRUN. See Matching process for details about overrun behavior.
1010b: RANSWER[4] — A frame was configured to recognize a Remote Request frame and transmit	RANSWER	—	TANSWER(1110b)	0	A Remote Answer was configured to recognize a remote request frame received. After that an MB is set to transmit a response frame. The code is

Table continues on the next page...

Table 11-185. Message buffer code for Rx buffers (continued)

CODE description	Rx code BEFORE receive new frame	SRV[1]	Rx code AFTER successful reception[2]	RRS[3]	Comment
a Response frame in return.[5]					automatically changed to TANSWER (1110b). See Matching process for details. If CTRL2[RRS] is negated, transmit a response frame whenever a remote request frame with the same ID is received.
		—	—	1	This code is ignored during matching and arbitration process. See Matching process for details.
CODE[0]=1: BUSY — FlexCAN is updating the contents of the MB. The CPU must not access the MB.	BUSY[6]	—	FULL	—	Indicates that the MB is being updated. It will be negated automatically and does not interfere with the next CODE.
		—	OVERRUN	—	

1. SRV: Serviced MB. MB was read and unlocked by reading TIMER or other MB.
2. A frame is considered a successful reception after the frame to be moved to MB (move-in process). See Move-in for details.
3. Remote Request Stored bit, see "Control 2 register (CTRL2)" for details.
4. Code 1010b is not considered Tx and an MB with this code should not be aborted.
5. Code 1010b must be used in message buffers configured in CAN FD format, having the EDL bit set.
6. Note that for Tx MBs, the BUSY bit should be ignored upon read, except when AEN bit is set in the MCR register. If this bit is asserted, the corresponding MB does not participate in the matching process.

Table 11-186. Message buffer code for Tx buffers

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
1000b: INACTIVE — MB is not active	INACTIVE	—	—	MB does not participate in arbitration process.
1001b: ABORT — MB is aborted	ABORT	—	—	MB does not participate in arbitration process.
1100b: DATA — MB is a Tx data frame (MB RTR must be 0)	DATA	0	INACTIVE	Transmit data frame unconditionally once. After transmission, the MB automatically

Table continues on the next page...

Table 11-186. Message buffer code for Tx buffers (continued)

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
				returns to the INACTIVE state.
1100b: REMOTE — MB is a Tx Remote Request frame (MB RTR must be 1)	REMOTE	1	EMPTY	Transmit remote request frame unconditionally once. After transmission, the MB automatically becomes an Rx Empty MB with the same ID.
1110b: TANSWER — MB is a Tx Response frame from an incoming Remote Request frame	TANSWER	—	RANSWER	This is an intermediate code that is automatically written to the MB by the CHI as a result of a match to a remote request frame. The remote response frame will be transmitted unconditionally once, and then the code will automatically return to RANSWER (1010b). The CPU can also write this code with the same effect. The remote response frame can be either a data frame or another remote request frame depending on the RTR bit value. See Matching process and Arbitration process for details.

SRR — Substitute Remote Request

Fixed recessive bit, used only in extended format. It must be set to one by the user for transmission (Tx Buffers) and will be stored with the value received on the CAN bus for Rx receiving buffers. It can be received as either recessive or dominant. If FlexCAN receives this bit as dominant, then it is interpreted as an arbitration loss.

1 = Recessive value is compulsory for transmission in extended format frames

0 = Dominant is not a valid value for transmission in extended format frames

IDE — ID Extended Bit

This field identifies whether the frame format is standard or extended.

1 = Frame format is extended

0 = Frame format is standard

RTR — Remote Transmission Request

This bit affects the behavior of remote frames and is part of the reception filter. See Table 11-185, Table 11-186, and the description of the RRS field in Control 2 register (CTRL2) for additional details.

If FlexCAN transmits this bit as '1' (recessive) and receives it as '0' (dominant), it is interpreted as an arbitration loss. If this bit is transmitted as '0' (dominant), then if it is received as '1' (recessive), the FlexCAN module treats it as a bit error. If the value received matches the value transmitted, it is considered a successful bit transmission.

1 = Indicates the current MB may have a remote request frame to be transmitted if MB is Tx. If the MB is Rx then incoming remote request frames may be stored.

0 = Indicates the current MB has a data frame to be transmitted. In Rx MB it may be considered in matching processes.

NOTE

When configuring CAN FD frames, the RTR bit must be negated.

DLC — Length of Data in Bytes

This 4-bit field is the length (in bytes) of the Rx or Tx data, which is located in offset 8h–Fh of the MB space (see Table 11-184). In reception, this field is written by the FlexCAN module, copied from the DLC (Data Length Code) field of the received frame. In transmission, this field is written by the CPU and corresponds to the DLC field value of the frame to be transmitted. When RTR = 1, the frame to be transmitted is a remote frame and does not include the data field, regardless of the DLC field (see Table 11-187).

TIME STAMP — Free-Running Counter Time Stamp

This 16-bit field is a copy of the Free-Running Timer, captured for Tx and Rx frames at the time when the beginning of the Identifier field appears on the CAN bus.

PRIO — Local priority

This 3-bit field is used only when MCR[LPRIO_EN] is set, and it only makes sense for Tx mailboxes. These bits are not transmitted. They are appended to the regular ID to define the transmission priority. See Arbitration process.

ID — Frame Identifier

In standard frame format, only the 11 most significant bits (28 to 18) are used for frame identification in both receive and transmit cases. The 18 least significant bits are ignored. In extended frame format, all bits are used for frame identification in both receive and transmit cases.

DATA BYTE 0 to 63 — Data Field

Up to sixty four bytes can be used for a data frame, depending on the size of payload selected for the message buffers.

For Rx frames, the data is stored as it is received from the CAN bus. DATA BYTE (*n*) is valid only if *n* is less than DLC as shown in the table below.

Table 11-187. DATA BYTEs validity

DLC	Valid DATA BYTEs
0	none
1	DATA BYTE 0
2	DATA BYTE 0 to 1
3	DATA BYTE 0 to 2
4	DATA BYTE 0 to 3
5	DATA BYTE 0 to 4
6	DATA BYTE 0 to 5
7	DATA BYTE 0 to 6
8	DATA BYTE 0 to 7
9	DATA BYTE 0 to 11
10	DATA BYTE 0 to 15
11	DATA BYTE 0 to 19
12	DATA BYTE 0 to 23
13	DATA BYTE 0 to 31
14	DATA BYTE 0 to 47
15	DATA BYTE 0 to 63

11.8.5.4 FlexCAN memory partition for CAN FD

When CAN FD is enabled, the FlexCAN RAM can be partitioned in blocks of 512 bytes. Each block can accommodate a number of message buffers which depends on the configuration provided by FDCTRL[MBDSRn] bit fields as shown in table below.

Table 11-188. RAM partition

RAM block	Number of MBs with 8 bytes (default range)	Size control bit field in FDCTRL register	Number of MBs of different sizes, per block
0	0 to 31	MBDSR0	MBDSR0=00, 32 MBs with 8 bytes payload MBDSR0=01, 21 MBs with 16 bytes payload MBDSR0=10, 12 MBs with 32 bytes payload MBDSR0=11, 7 MBs with 64 bytes payload
1	32 to 63	MBDSR1	MBDSR1=00, 32 MBs with 8 bytes payload MBDSR1=01, 21 MBs with 16 bytes payload MBDSR1=10, 12 MBs with 32 bytes payload MBDSR1=11, 7 MBs with 64 bytes payload

When payload sizes of 16, 32, or 64 bytes are configured in some or all RAM blocks, the total number of MBs and its respective number order may differ from the default configuration of 8 bytes. For example, suppose Block0 is configured to 8 bytes payload, Block1 to 16 bytes, Then the following table indicates how the message buffers will be arranged in RAM.

Table 11-189. RAM partition example

RAM block	Payload size	Number of MBs in the RAM block	Message buffer range
0	FDCTRL[MBDSR0]=00, 8 bytes payload	32	0 to 31
1	FDCTRL[MBDSR1]=01, 16 bytes payload	21	32 to 52

11.8.5.5 FlexCAN message buffer memory map

The FlexCAN memory buffers are allocated in memory according to the tables below.

11.8.5.6 Rx FIFO structure

When MCR[RFEN] is set, the memory area 80h–DCh (which is normally occupied by MBs 0–5) is used by the reception FIFO engine.

The region 80h–8Ch contains the output of the FIFO which must be read by the CPU as a message buffer. This output contains the oldest message that has been received but not yet read. The region 90h–DCh is reserved for internal use of the FIFO engine.

An additional memory area, which starts at E0h and may extend up to 2DCh (normally occupied by MBs 6–37) depending on the CTRL2[RFFN] field setting, contains the ID filter table (configurable from 8 to 128 table elements) that specifies filtering criteria for accepting frames into the FIFO.

Out of reset, the ID filter table flexible memory area defaults to E0h and extends only to FCh, which corresponds to MBs 6 to 7 for RFFN = 0, for backward compatibility with previous versions of FlexCAN.

The following shows the Rx FIFO data structure.

Table 11-194. Rx FIFO structure

	31 28 24	23 22	21	20	19 18 17 16	15 8	7 0
80h	IDHIT	SRR	IDE	RTR	DLC	TIME STAMP	
84h		ID standard			ID extended		
88h	Data byte 0	Data byte 1				Data byte 2	Data byte 3
8Ch	Data byte 4	Data byte 5				Data byte 6	Data byte 7
90h–DCh	Reserved						
E0h	ID filter table element 0						
E4h	ID filter table element 1						
E8h–2D4h	ID filter table elements 2 to 125						
2D8h	ID filter table element 126						

Table continues on the next page...

Table 11-194. Rx FIFO structure (continued)

2DCh	ID filter table element 127
	= Unimplemented or reserved

Each ID filter table element occupies an entire 32-bit word and can be compounded by one, two, or four Identifier Acceptance Filters (IDAF) depending on the MCR[IDAM] field setting. The following figures show the IDAF indexation.

The following table shows the three different formats of the ID table elements. Note that all elements of the table must have the same format. See Rx FIFO for more information.

Table 11-195. ID table structure

Format	31	30	29 24	23 16	15	14	13 8	7 1	0
A	RTR	IDE	RXIDA (standard = 29–19, extended = 29–1)						
B	RTR	IDE	RXIDB_0 (standard = 29–19, extended = 29–16)		RTR	IDE	RXIDB_1 (standard = 13–3, extended = 13–0)		
C	RXIDC_0 (std/ext = 31–24)			RXIDC_1 (std/ext = 23–16)	RXIDC_2 (std/ext = 15–8)			RXIDC_3 (std/ext = 7–0)	
	= Unimplemented or Reserved								

RTR — Remote frame

This bit specifies if remote frames are accepted into the FIFO if they match the target ID.

1 = Remote frames can be accepted and data frames are rejected

0 = Remote frames are rejected and data frames can be accepted

IDE — Extended frame

Specifies whether extended or standard frames are accepted into the FIFO if they match the target ID.

1 = Extended frames can be accepted and standard frames are rejected

0 = Extended frames are rejected and standard frames can be accepted

RXIDA — Rx frame identifier (Format A)

Specifies an ID to be used as acceptance criteria for the FIFO. In the standard frame format, only the 11 most significant bits (29 to 19) are used for frame identification. In the extended frame format, all bits are used.

RXIDB_0, RXIDB_1 — Rx frame identifier (Format B)

Specifies an ID to be used as acceptance criteria for the FIFO. In the standard frame format, the 11 most significant bits (a full standard ID) (29 to 19 and 13 to 3) are used for frame identification. In the extended frame format, all 14 bits of the field are compared to the 14 most significant bits of the received ID.

RXIDC_0, RXIDC_1, RXIDC_2, RXIDC_3 — Rx frame identifier (Format C)

Specifies an ID to be used as acceptance criteria for the FIFO. In both standard and extended frame formats, all 8 bits of the field are compared to the 8 most significant bits of the received ID.

IDHIT — Identifier acceptance filter hit indicator

This 9-bit field indicates which identifier acceptance filter was hit by the received message that is in the output of the Rx FIFO. See Rx FIFO for more information.

11.8.6 Glossary

Active message buffer

A message buffer is *active* if it can participate in the current matching or arbitration process.

Bus interface unit

FlexCAN submodule responsible for the interface to the CPU.

Bus off

See CAN Specification.[6]

CAN

Controller Area Network, a serial communication protocol defined in CAN Specification[6] and ISO International Standard.[7]

CHI

Controller-host interface, a FlexCAN submodule responsible for message buffer matching and arbitration algorithms.

CRC

Cyclic redundancy check

Dominant bit

A dominant bit wins the arbitration on the CAN bus. It is transmitted as 0.

Doze mode

A system low-power mode where the CPU bus remains active and a global Doze mode request is sent to all peripherals asking them to enter low power mode.

6. Controller Area Network – CAN Specification Version 2.0 Part A, Part B, Robert Bosch GmbH, 1991.
7. ISO International Standard – ISO 11898 First Edition 1993 Road Vehicles – Interchange of Digital Information – Controller Area Network (CAN) for high-speed Communication.

Error active

See CAN Specification.[7]

Error frame

See CAN Specification.[7]

Error passive

See CAN Specification.[7]

Form error

See CAN Specification.[7]

Hard reset

A reset coming from an external pin and/or following power-on. It resets everything.

Idle

See CAN Specification.[7]

Information processing time

See CAN Specification.[7]

Intermission

See CAN Specification.[7]

Matching elements

Data used in the matching process, such as ID, filter, mask, etc.

MB

See Message buffer.

Message buffer

Internal FlexCAN data structure containing bytes received from, or to be transmitted to, the CAN line, as well as information about this data.

Overload frame

See CAN Specification.[7]

Phase buffer segment

See CAN Specification.[7]

Recessive bit

A recessive bit loses the arbitration on the CAN bus. It is transmitted as 1.

Sclock

Serial clock. Obtained by dividing the clock feeding the CAN engine (oscillator or bus clock) by a prescaler factor. The Sclock period defines the time quantum for CAN protocol timing.

Soft reset

Global reset typically used by peripherals to reinitialize some of its registers, but not all of them.

Stop mode

A system low-power mode in which all chip clocks are stopped for maximum power savings.

Stuffing error

See CAN Specification.[7]

Time quantum

This is equal to the Sclock period. It is the minimum time period used to compose the CAN protocol bit timing.

Chapter 12
Timers

12.1 General Purpose Timer (GPT)

12.1.1 Overview

The General Purpose Timer (GPT) is a 32-bit up-counter with clock source and frequency scaling options to provide a wide range of timing rates for various system applications. External hardware can send the GPT a "capture event" signal on an input pin to load the current timer value into a register for software to read. This capture signal can be configured to trigger the GPT on a rising or/and falling edge. Also, when the timer matches a preset value, the GPT can generate an interrupt for software and a "compare event" signal on output pins for external hardware.

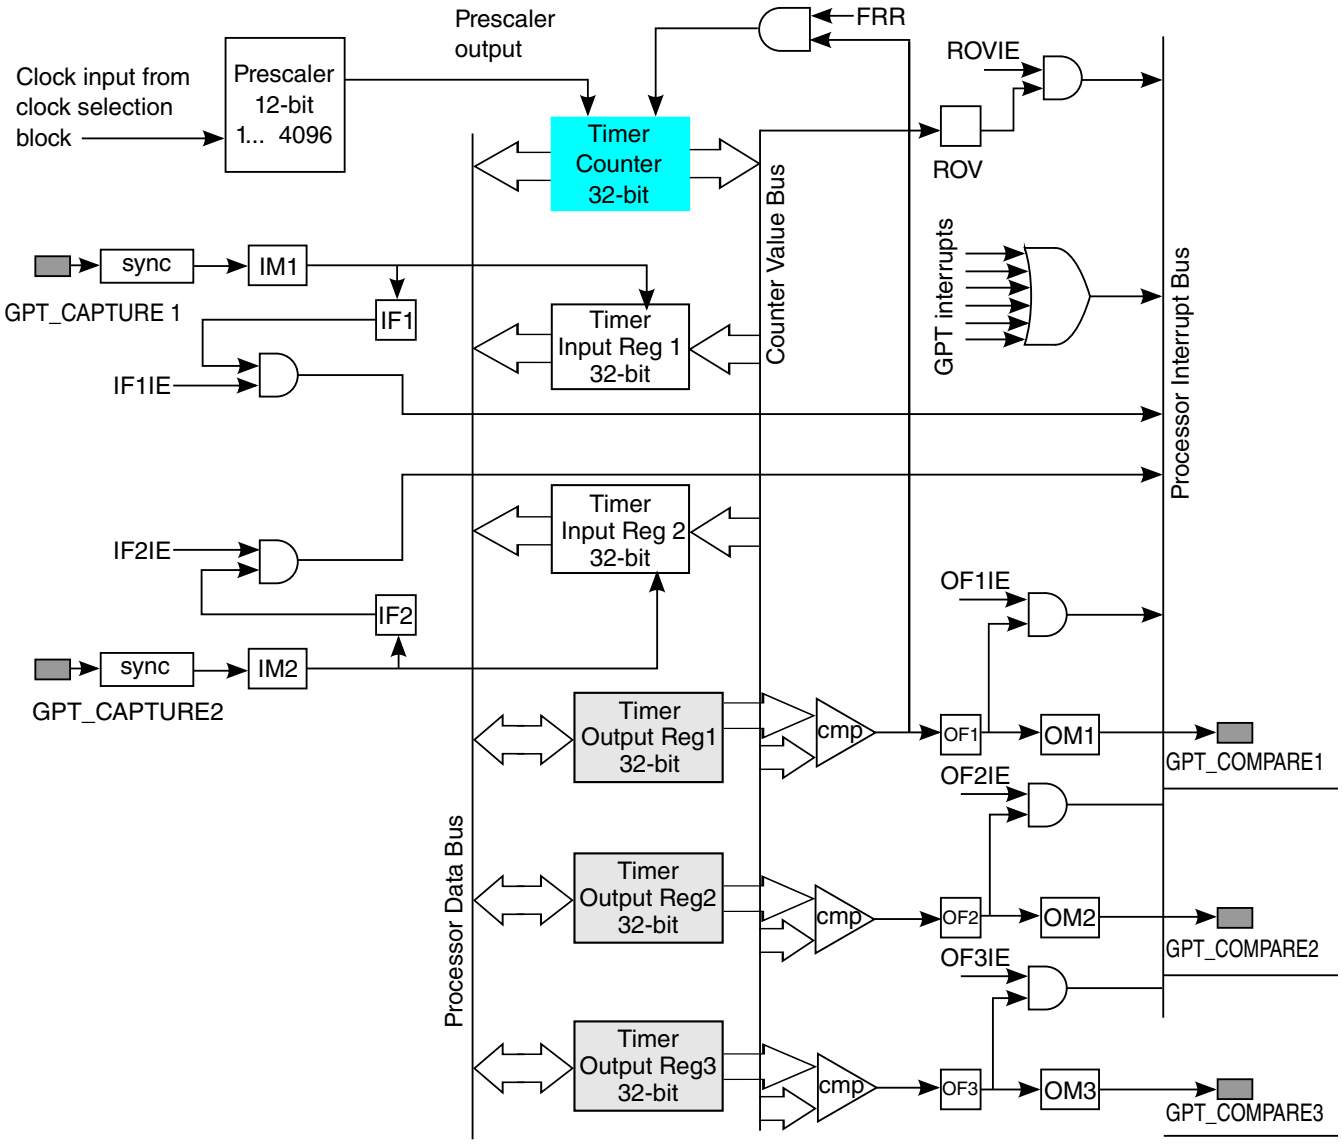

Figure 12-1. GPT Block Diagram

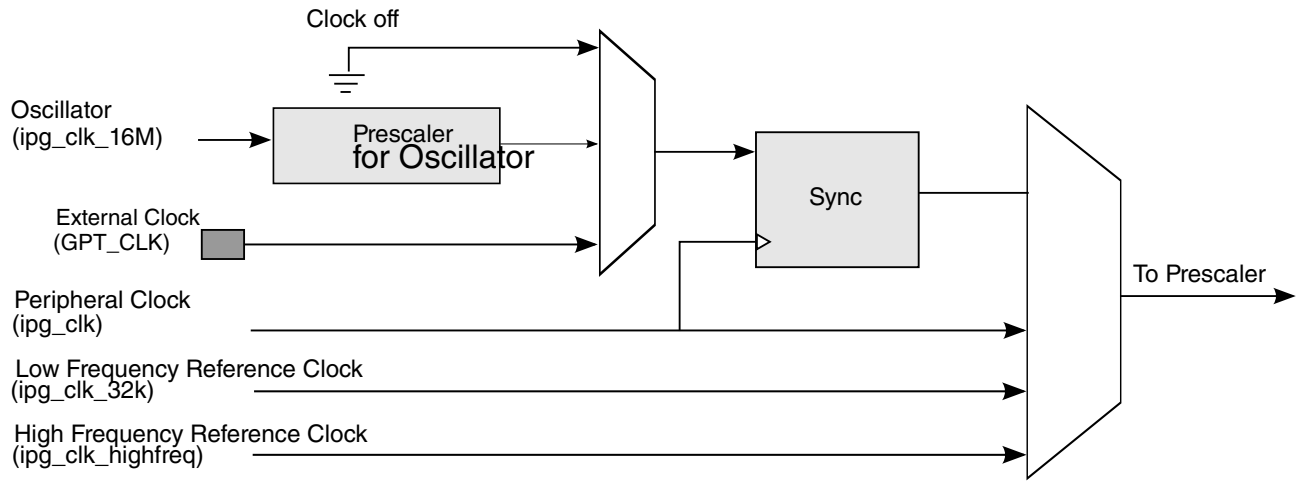

Figure 12-2. GPT Counter Clocks Diagram

12.1.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

12.1.2 Functional Description

This section provides a complete functional description of the GPT.

12.1.2.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

12.1.2.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

12.1.2.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

12.1.2.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT_CNT) that is a 32-bit free-running *up-counter,* which starts counting *after it is enabled by software* (EN=1). The counter's clock source is the output of the prescaler labelled "Prescaler output" in Figure 12-1.

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
  - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
  - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT_CNT).
- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xFFFF_FFFF.
- The software reset (SWR bit in the GPT_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled.*

12.1.2.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle (clock selected to run the counter) *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

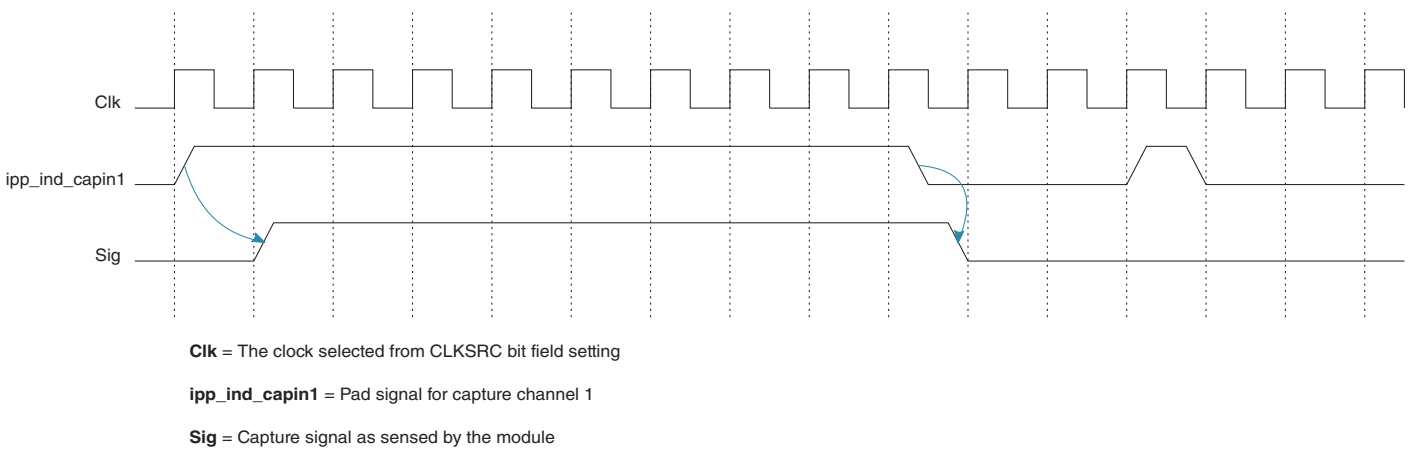

Figure 12-3. Input Capture Event Timing

12.1.2.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin is set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period according to the Output Compare Operating Mode bits in the Control Register (CR[OM*n*]).

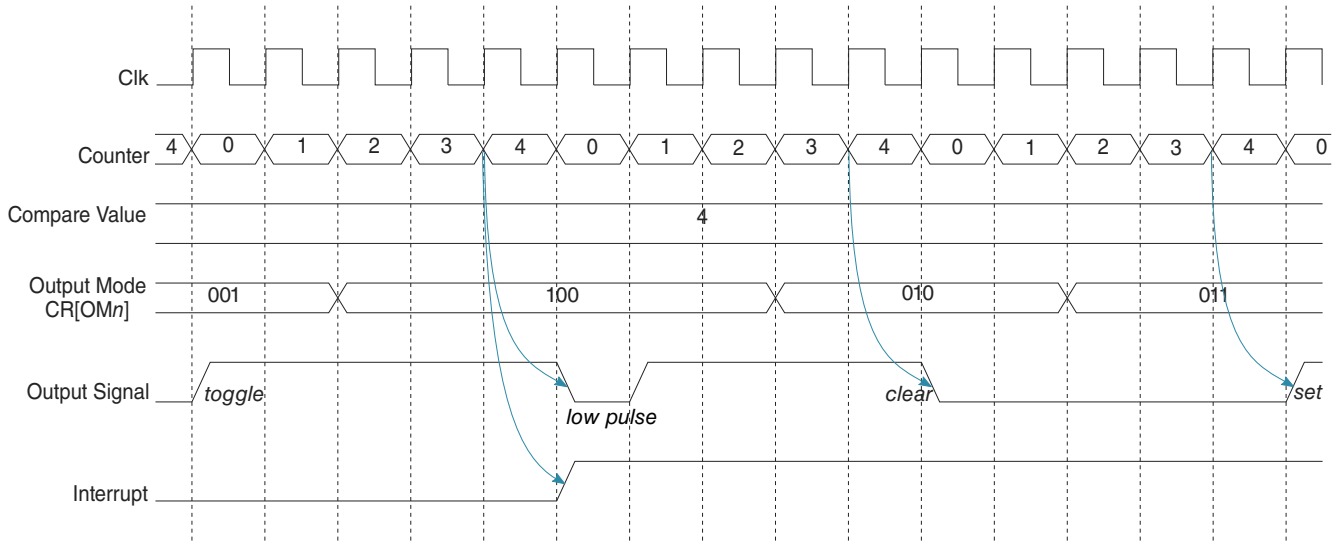

Figure 12-4. Output Compare and Interrupt Timing

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

12.1.2.2.3 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock (GPT_CLK), which can be used *only if* the Peripheral Clock (ipg_clk) is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

12.1.2.2.4 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT_CR control register), then the GPT timer is halted.

12.1.2.3 Clocks

The clock that is input to the prescaler can be selected from multiple clock sources. The following table describes the clock sources for GPT. See chip clock control block for clock source connection, configuration and gating information.

Table 12-1. GPT Clocks

Clock name	Description
Peripheral Clock (ipg_clk)	This is the internal clock used to access the module registers. If the Peripheral Clock or the External Clock (GPT_CLK) is selected as the Clock Source (CLKSRC=001 or 011), then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock (ipg_clk) can be switched OFF.
Low Reference Clock (ipg_clk_32k)	This low-frequency 32-kHz reference clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode.
High-Frequency Clock (ipg_clk_highfreq)	Provided by the Clock Controller Module (CCM), this high-frequency reference clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*.
Oscillator Clock (ipg_clk_16M)	This 16-MHz oscillator reference clock is intended to be used against frequency changes of the Peripheral Clock (ipg_clk) to provide a more accurate timer clock for system operation. The CCM provides the 16 MHz Oscillator Clock *without* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 16 MHz Oscillator Clock is divided by a dedicated prescaler to make sure the clock frequency less than half of System Bus Clock (ahb_clk).
External Clock (GPT_CLK)	The External Clock comes from *outside* the device and can be selected to run the GPT counter. The External Clock frequency is limited to < 1/4 frequency of the Peripheral Clock (ipg_clk) for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock (ipg_clk) is not available, then the External Clock *cannot be used* to run the counter.

The clock input source is configured using the clock source field (CLKSRC, in the GPT_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT_CR control register) to 000. **The CLKSRC field value should be changed** *only after disabling the GPT* (by setting the EN bit in the GPT_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

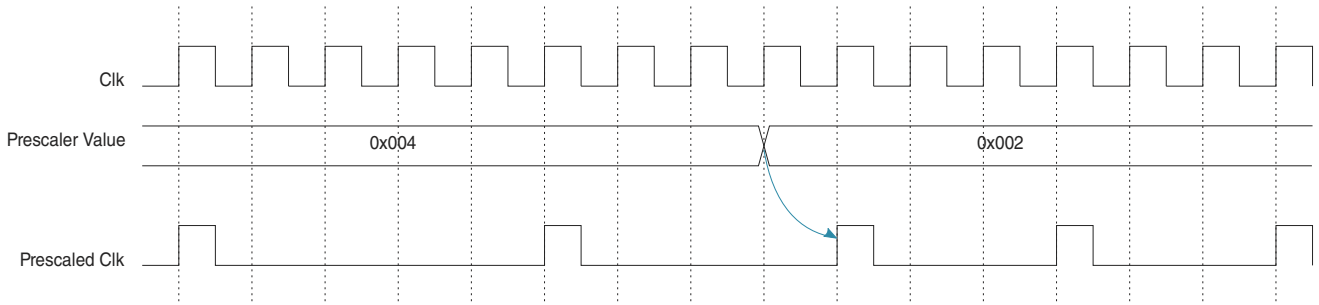

Figure 12-5. Prescaler Value Change Timing Diagram

12.1.2.4 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

  The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT_IR register; the associated status bit is the ROV bit in the GPT_SR register.

- Input Capture Interrupt 1, 2

  After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT_IR register); the associated status bits are IF2 and IF1 (in the GPT_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

  After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

12.1.3 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip,* except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip. Please see IOMUX Controller for GPT pin mux assignments.

Table 12-2. Off-Chip Module Signals

Name	Direction	Function	Reset State	Pull-Up
GPT_CLK	I	Input pin for an external clock that the counter can be operated at.	-	Passive Hysteresis
GPT_CAPTURE1	I	Input pin for a capture event for Input Capture Channel 1.	-	Passive
GPT_CAPTURE2	I	Input pin for a capture event for Input Capture Channel 2.	-	Passive
GPT_COMPARE1	O	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	0	Passive
GPT_COMPARE2	O	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	0	Passive
GPT_COMPARE3	O	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	0	Passive

12.1.3.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose. The external clock input (GPT_CLK) is treated as asynchronous to the peripheral clock (ipg_clk). To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock (ipg_clk). Hysteresis characteristics on this pad will be required because this is a clock input.

12.1.3.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*. A positive / negative edge on these GPT_CAPTURE*n* signals can trigger this capture event. These signals are treated as asynchronous to the peripheral clock (ipg_clk). Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

12.1.3.3 Output Compare Signals

The GPT_COMPARE*n* signals indicate that an output compare event has occurred on the corresponding Output Compare Channel *n*; see Output Compare.

12.1.4 Initialization/ Application Information

12.1.4.1 Selecting the Clock Source

The Clock Source field in the Control Register (CR[CLKSRC]) selects the clock source. CLKSRC should be changed only after disabling the GPT (CR[EN]=0). To change the clock source, follow this sequence:

1. Disable the GPT: CR[EN]=0
2. Disable GPT interrupts: Clear the Interrupt Register (IR)
3. Configure the Output Mode to unconnected/ disconnected for all channels: CR[OM*n*]=0
4. Disable the Input Capture Modes: CR[IM*n*]=0
5. Change the clock source CR[CLKSRC] to the desired value.
6. Assert a GPT software reset: CR[SWR]=1
7. Clear the flags in the GPT Status Register (SR) by writing 1s to them.
8. Reset the GPT counter to zero: CR[ENMOD]=1
9. Enable the GPT: CR[EN]=1
10. Enable GPT interrupts: For the desired interrupts, write 1s to their enable bits in IR.

12.1.5 Memory map and register definitions

12.1.5.1 GPT register descriptions

The GPT has 10 user-accessible 32-bit registers used to configure, operate and monitor the GPT.

A write access to the GPT Status Registers (Read-only registers ICR1, ICR2, CNT) generates a bus exception.

12.1.5.1.1 GPT memory map

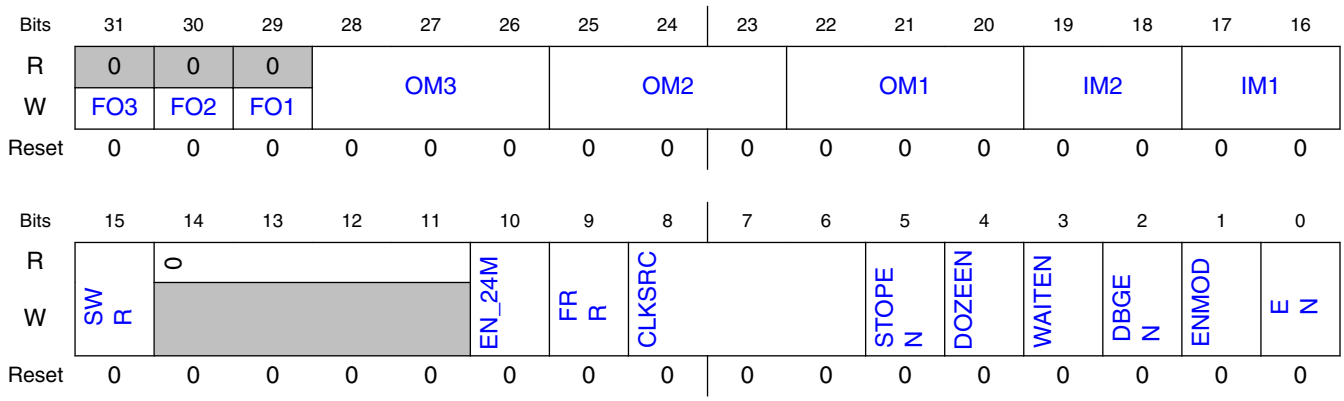
DEFAULT_NICKNAME base address: 0h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
0	GPT Control Register (CR)	32	RW	0000_0000
4	GPT Prescaler Register (PR)	32	RW	0000_0000
8	GPT Status Register (SR)	32	W1C	0000_0000
C	GPT Interrupt Register (IR)	32	RW	0000_0000
10 - 18	GPT Output Compare Register (OCR1 - OCR3)	32	RW	FFFF_FFFF
1C - 20	GPT Input Capture Register (ICR1 - ICR2)	32	RO	0000_0000
24	GPT Counter Register (CNT)	32	RO	0000_0000

12.1.5.1.2 GPT Control Register (CR)

Contains configuration options for GPT operations, such as selecting the clock source for the counter and selecting a channel's output pin response when a compare event occurs. The CR register also includes the control bit (SWR) to trigger a software reset.

NOTE



Setting the SWR bit resets **all of the GPT registers** to their default reset values except for the EN, ENMOD, STOPEN, DOZEEN, WAITEN, and DBGEN bits in this register.

For applications where precise timing is critical, be aware that writes to the CR register take effect after one cycle of the module's register bus clock (1 wait state of latency). Reads to the register occur immediately (0 wait states).

12.1.5.1.2.1 Offset

Register	Offset
CR	0h

12.1.5.1.2.2 Diagram

12.1.5.1.2.3 Fields

Field	Description
31-29 FOn	Force Output Compare for Channel n By setting the FO*n* bit, software can force the timer Output Compare *n* pin to respond according to the pin action programmed in the OM*n* bits (in this register). This bit is self-clearing and always reads as zero. **NOTE:** The OF*n* flag in the Status register (SR) is not set. 0 - No effect 1 - Trigger the programmed response on the pin
28-26: OM3 25-23: OM2 22-20: OM1	Output Compare Operating Mode for Channel n Selects the response on the output pin when a compare event occurs. 000 - Output disabled. No response on pin. 001 - Toggle output pin 010 - Clear output pin 011 - Set output pin 1xx - Generate a low pulse that is one input clock cycle wide on the output pin. When OMn is first programmed as 1xx, the output pin is set to one immediately on the next input clock (if it was not one already). "Input clock" here refers to the clock selected by the CLKSRC field of this register.
19-18: IM2 17-16: IM1	Input Capture Operating Mode for Channel n Selects what transition on the input pin triggers a capture event. 00 - Capture disabled 01 - Capture on rising edge only

Table continues on the next page...

Field	Description
	10 - Capture on falling edge only 11 - Capture on both edges
15 SWR	Software Reset Setting SWR resets **all of the registers** to their default reset values except for the DOZEEN, EN, ENMOD, STOPEN, WAITEN, and DBGEN bits in this register. The SWR bit remains set while the module is resetting. The SWR bit automatically clears when the reset procedure finishes. 0 - GPT is not in software reset state 1 - GPT is in software reset state
14-11 —	Reserved Software should write 0s to this reserved field. This field always reads as zero.
10 EN_24M	Enable Oscillator Clock Input Enables the 16-MHz clock input from an oscillator. 0 - Disable 1 - Enable
9 FRR	Free-Run or Restart Mode Selects the behavior of the GPT when a compare event in channel 1 occurs. 0 - Restart mode. After a compare event, the counter resets to 0x0000_0000 and resumes counting. 1 - Free-Run mode. After a compare event, the counter continues counting until 0xFFFF_FFFF and then rolls over to 0.
8-6 CLKSRC	Clock Source Select Selects which clock goes to the prescaler and subsequently runs the GPT counter. **NOTE:** The CLKSRC field value should be changed only after disabling the GPT (EN=0). For other programming requirements when changing the clock source, see section Selecting the Clock Source. 000 - No clock 001 - Peripheral Clock (ipg_clk) 010 - High Frequency Reference Clock (ipg_clk_highfreq) 011 - External Clock 100 - Low Frequency Reference Clock (ipg_clk_32k) 101 - Oscillator as Reference Clock (ipg_clk_16M)
5 STOPEN	GPT Stop Mode Enable Enables GPT operation *during Stop mode*. 0 - Disable in Stop mode 1 - Enable in Stop mode
4 DOZEEN	GPT Doze Mode Enable Enables GPT operation *during Doze mode*. 0 - Disable in Doze mode 1 - Enable in Doze mode
3 WAITEN	GPT Wait Mode Enable Enables GPT operation *during Wait mode*.

Table continues on the next page...

Field	Description
	0 - Disable in Wait mode 1 - Enable in Wait mode
2 DBGEN	GPT Debug Mode Enable Enables GPT operation *during Debug mode*. 0 - Disable in Debug mode 1 - Enable in Debug mode
1 ENMOD	GPT Enable Mode When the GPT is disabled (EN=0), both the Main Counter and Prescaler Counter *freeze their current count values*. The ENMOD bit selects the value of the Main Counter and Prescaler Counter when GPT is enabled again (EN=1). **NOTE:** If GPT is programmed to be disabled in a low power mode (STOP/WAIT), the Main Counter and Prescaler Counter *freeze at their current count values* when the GPT enters low power mode. When GPT exits low power mode, the Main Counter and Prescaler Counter start counting from their frozen values, regardless of the ENMOD bit value. **NOTE:** A software reset (SWR=1) clears the Main Counter and Prescaler Counter values, regardless of the value of EN or ENMOD bits. 0 - Restart counting from their frozen values after GPT is enabled (EN=1). 1 - Reset counting from 0 after GPT is enabled (EN=1).
0 EN	GPT Enable Enables the GPT module. **NOTE:** Before setting the EN bit, *all registers should be properly programmed*. 0 - Disable 1 - Enable

12.1.5.1.3 GPT Prescaler Register (PR)

Contains the *divide value* of the clock that runs the counter.

12.1.5.1.3.1 Offset

Register	Offset
PR	4h

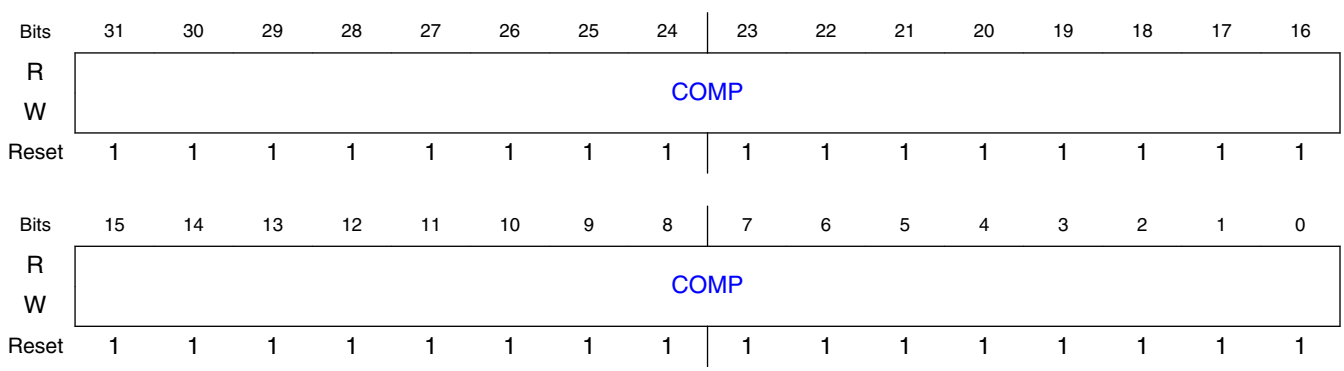
5 ROVIE	Rollover Interrupt Enable Enables the Rollover interrupt. 0 - Disable 1 - Enable
4-3 IFnIE	Input Capture Flag for Channel n Interrupt Enable Enables the Input Capture Flag for Channel *n* interrupt. 0 - Disable 1 - Enable
2-0 OFnIE	Output Compare Flag for Channel n Interrupt Enable Enables the Output Compare Flag for Channel *n* interrupt.

Field	Description
	0 - Disable 1 - Enable

12.1.5.1.6 GPT Output Compare Register (OCR1 - OCR3)

Holds the value that determines when a compare event is generated on the corresponding Output Compare Channel *n*.

NOTE



The behavior of OCR1 is different compared with OCR2 and OCR3:

- A write access to OCR1 while in Restart mode (CR[FRR]=0) resets the GPT counter.
- Writes to OCR1 take effect after one cycle of the module's register bus clock (1 wait state of latency). Reads to the register occur immediately (0 wait states).

12.2 Pulse Width Modulation (PWM)

12.2.1 Overview

The Pulse Width Modulation (PWM) has a 16-bit counter, and is optimized to generate sound from stored sample audio images and it can also generate tones. It uses 16-bit resolution and a 4 x 16 data FIFO.

This section presents an overview of the PWM. A block diagram of the PWM module is shown in the figure below.

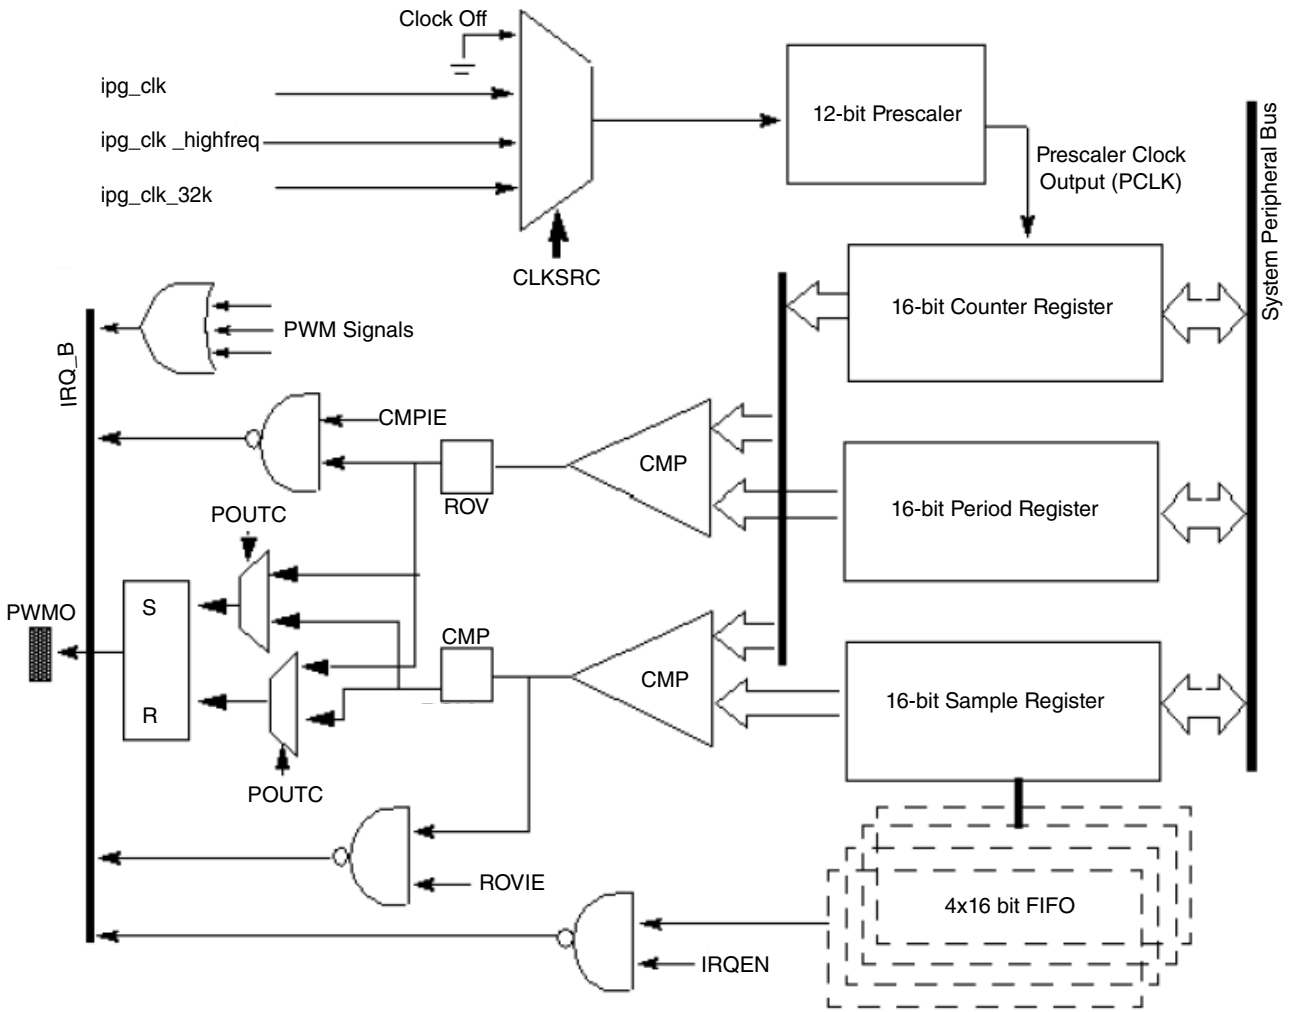

Figure 12-6. Pulse-Width Modulator Block Diagram

The following features characterize the PWM:

- 16-bit up-counter with clock source selection
- 4 x 16 FIFO to minimize interrupt overhead
- 12-bit prescaler for division of clock
- Sound and melody generation
- Active high or active low configured output
- Can be programmed to be active in low-power mode
- Can be programmed to be active in debug mode
- Interrupts at compare and rollover

12.2.2 External Signals

The PWM follows IP Bus protocol when interfacing with the processor core. PWM does not have any interface signals with any other block inside the chip except for clock and reset inputs from the Clock Control Module (CCM), System Reset Controller (SRC), and interrupt signals to the processor interrupt handler. There is a single output signal.

The following table outlines the external signals.

12.2.3 Functional Description

The following sections detail the PWM operation and function.

12.2.3.1 Operation

The output of the PWM is a toggling signal whose frequency and duty cycle can be modulated by programming the appropriate registers. It has a 16-bit up counter which counts from 0x0000 until the counter value equals the PWM_PR + 1. After this match occurs the counter is reset to 0x0000.

At the beginning of a count period cycle, the PWMO pin is set to one (default) and the counter begins counting up from 0x0000. The sample value in the sample FIFO is compared on each count of prescaler clock. When the sample and count values match, the PWMO signal is cleared to zero (default). The counter continues counting until the period match occurs and subsequently another period cycle begins.

When the PWM is enabled, the counter starts running and generates an output with the reset values in the period and sample registers. It is recommended that the programming of these registers be done before PWM is enabled.

A hardware reset results in all the PWM count and sample registers being cleared and the FIFO being flushed. The control register shows that FIFO is empty and it can be written into, and the PWM is disabled. A software reset has the same results, however the state of the DBGEN, STOPEN, DOZEN, and WAITEN bits in the control register are not affected. Software reset can be asserted even when the PWM is in disabled state.

12.2.3.1.1 FIFO

Digital sample values can be loaded into the pulse-width modulator as 16-bit words. The endianess can be changed using the BCTR and HCTR bits of the control register. A 4-word (16-bit) FIFO minimizes interrupt overhead. A maskable interrupt is generated when the number of data words fall below the water level set by the FWM field in the control register.

A write to the PWM_SAR sample register results in the value being stored into the FIFO if it is not full. A write when the FIFO is full sets FWE (FIFO write error) bit in the status register and the FIFO contents remain unchanged. The FIFO can be written at any time, but can be read only when the PWM is enabled. The PWM_SR[FIFOAV] field shows how many data words are currently contained in the FIFO and whether or not it can be written into.

A read on the sample register yields the current FIFO value that is being used, or will be used, by the PWM for generation on the output signal. Therefore, a write and a subsequent read on the sample register may result in different values being obtained.

12.2.3.1.2 Rollover and Compare Event

The counter is reset to 0x0000 after its value equals the PWM_PR[PERIOD] + 1 and resumes counting thereafter. This event is referred to as a rollover. For example, if PWM_PR[PERIOD] = 0x0000, the counter is reset when it equals 0x0001. When PWM_PR[PERIOD] = 0xFFFF or 0xFFFE, the counter is reset when it equals 0xFFFF. For more information, see the PWM Period Register (PWM_PR) description.

During a rollover event the output is either set (default), reset or has no effect according to the programming of the POUTC field in the control register. This event can also generate an interrupt if the respective interrupt enable bit is set in the control register.

When the counter value reaches the sample value, the output of the PWM is reset (default), set or has no effect according to the programming of the POUTC field of control register. This event is referred to as a compare event. This event can also generate an interrupt if the respective interrupt enable bit is set in the control register.

If the rollover event sets the PWM output signal, the compare event will reset it and vice versa for a particular programming configuration of POUTC field.

12.2.3.1.3 Low Power Mode Behavior

In low power mode, if the clock from the selected clock source is available, the PWM counter continues to run and an output is produced, depending on whether the control bit for that mode is set or not. In the absence of the clock itself, or if the corresponding low power bit in the control register is 0, the counter is reset and resumes counting when it exits the low power mode.

12.2.3.1.4 Debug Mode Behavior

In debug mode, PWM has the option of continuing to run or be halted. If the DBGEN bit is not set in the PWM_PWMCR, the PWM is halted. If the DBGEN bit is set, then the PWM will continue to run in the debug mode.

12.2.4 Enable Sequence for the PWM

The sequence found here should be used to enable the PWM.

1. Configure the desired settings for the PWM Control Register (PWMx_PWMCR) while keeping the PWM disabled (PWMx_PWMCR[0]=0).
2. Enable the desired interrupts in the PWM Interrupt Register (PWMx_PWMIR).
3. One to three initial samples may be written to the PWM Sample Register (PWMx_PWMSAR). The initial sample values will be loaded into the PWM FIFO even if the PWM is not yet enabled. Do not write a 4th sample because the FIFO will become full and trigger a FIFO Write Error (FWE). This error will prevent the PWM from starting once it is enabled.
4. Check the FIFO Write Error status bit (FWE), the Compare status bit (CMP) and the Roll-over status bit (ROV) in the PWM Status Register (PWMx_PWMSR) to make sure they are all zero. Any non-zero status bits should be cleared by writing a 1 to them.
5. Write the desired period to the PWM Period Register (PWMx_PWMPR).
6. Enable the PWM by writing a 1 to the PWM Enable bit, PWMx_PWMCR[0], while maintaining the other register bits in their previously configured state.

12.2.5 Disable Sequence for the PWM

The PWM can be disabled at any time by clearing the PWM enable bit, PWMx_PWMCR[0] to 0.

Any data remaining in the FIFO will not be produced at the PWM output after the PWM has been disabled and will remain in the FIFO until the PWM is enabled again. A software reset (setting PWMx_PWMCR[3] to 1) or a hardware reset will clear the FIFO and any remaining data will be lost.

12.2.6 PWM Memory Map/Register Definition

The PWM includes six user-accessible 32-bit registers.

PWM memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
3066_0000	PWM Control Register (PWM1_PWMCR)	32	R/W	0000_0000h	12.2.6.1/ 5148

12.2.6.1 PWM Control Register (PWMx_PWMCR)

The PWM control register (PWM_PWMCR) is used to configure the operating settings of the PWM. It contains the prescaler for the clock division.

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	PRESCALER												SWR	REPEAT		EN
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMCR field descriptions

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–26 FWM	FIFO Water Mark. These bits are used to set the data level at which the FIFO empty flag will be set and the corresponding interrupt generated 00 FIFO empty flag is set when there are more than or equal to 1 empty slots in FIFO 01 FIFO empty flag is set when there are more than or equal to 2 empty slots in FIFO 10 FIFO empty flag is set when there are more than or equal to 3 empty slots in FIFO 11 FIFO empty flag is set when there are more than or equal to 4 empty slots in FIFO
25 STOPEN	Stop Mode Enable. This bit keeps the PWM functional while in stop mode. When this bit is cleared, the input clock is gated off in stop mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in stop mode 1 Active in stop mode
24 DOZEN	Doze Mode Enable. This bit keeps the PWM functional in doze mode. When this bit is cleared, the input clock is gated off in doze mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in doze mode 1 Active in doze mode
23 WAITEN	Wait Mode Enable. This bit keeps the PWM functional in wait mode. When this bit is cleared, the input clock is gated off in wait mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in wait mode 1 Active in wait mode
22 DBGEN	Debug Mode Enable. This bit keeps the PWM functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in debug mode 1 Active in debug mode
21 BCTR	Byte Data Swap Control. This bit determines the byte ordering of the 16-bit data when it goes into the FIFO from the sample register. 0 byte ordering remains the same 1 byte ordering is reversed
20 HCTR	Half-word Data Swap Control. This bit determines which half word data from the 32-bit IP Bus interface is written into the lower 16 bits of the sample register. 0 Half word swapping does not take place 1 Half words from write data bus are swapped
19–18 POUTC	PWM Output Configuration. This bit field determines the mode of PWM output on the output pin. 00 Output pin is set at rollover and cleared at comparison 01 Output pin is cleared at rollover and set at comparison 10 PWM output is disconnected 11 PWM output is disconnected
17–16 CLKSRC	Select Clock Source. These bits determine which clock input will be selected for running the counter. After reset the system functional clock is selected. The input clock can also be turned off if these bits are set to 00. This field value should only be changed when the PWM is disabled

Table continues on the next page...

PWMx_PWMCR field descriptions (continued)

Field	Description
	00 Clock is off 01 ipg_clk 10 ipg_clk_highfreq 11 ipg_clk_32k
15–4 PRESCALER	Counter Clock Prescaler Value. This bit field determines the value by which the clock will be divided before it goes to the counter. 0x000 Divide by 1 0x001 Divide by 2 0xfff Divide by 4096
3 SWR	Software Reset. PWM is reset when this bit is set to 1. It is a self clearing bit. A write 1 to this bit is a single wait state write cycle. When the block is in reset state this bit is set and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values except for the DBGEN, STOPEN, DOZEN, and WAITEN bits in this control register. 0 PWM is out of reset 1 PWM is undergoing reset
2–1 REPEAT	Sample Repeat. This bit field determines the number of times each sample from the FIFO is to be used. 00 Use each sample once 01 Use each sample twice 10 Use each sample four times 11 Use each sample eight times
0 EN	PWM Enable. This bit enables the PWM. If this bit is not enabled, the clock prescaler and the counter is reset. When the PWM is enabled, it begins a new period, the output pin is set to start a new period while the prescaler and counter are released and counting begins. To make the PWM work with softreset and disable/enable, users can do software reset by seting the SWR bit, wait software reset done, configure the registers, and then enable the PWM by setting this bit to "1" Users can also disable/enable the PWM if PWM would like to be stopped and resumed with same registers configurations . 0 PWM disabled 1 PWM enabled

12.2.6.2 PWM Status Register (PWMx_PWMSR)

The PWM status register (PWM_PWMSR) contains seven bits which display the state of the FIFO and the occurrence of rollover and compare events. The FIFOAV bit is read-only but the other four bits can be cleared by writing 1 to them. The FE, ROV, and CMP bits are associated with FIFO-Empty, Roll-over, and Compare interrupts, respectively.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0

PWMx_PWMSR field descriptions

Field	Description
31–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6 FWE	FIFO Write Error Status. This bit shows that an attempt has been made to write FIFO when it is full. 0 FIFO write error not occurred 1 FIFO write error occurred
5 CMP	Compare Status. This bit shows that a compare event has occurred. 0 Compare event not occurred 1 Compare event occurred
4 ROV	Roll-over Status. This bit shows that a roll-over event has occurred. 0 Roll-over event not occurred 1 Roll-over event occurred
3 FE	FIFO Empty Status Bit. This bit indicates the FIFO data level in comparison to the water level set by FWM field in the control register. 0 Data level is above water mark 1 When the data level falls below the mark set by FWM field
FIFOAV	FIFO Available. These read-only bits indicate the data level remaining in the FIFO. An attempted write to these bits will not affect their value and no transfer error is generated. 000 No data available 001 1 word of data in FIFO

Table continues on the next page...

Field	Description
	010 2 words of data in FIFO 011 3 words of data in FIFO 100 4 words of data in FIFO 101 unused 110 unused 111 unused

12.2.6.3 PWM Interrupt Register (PWMx_PWMIR)

The PWM Interrupt register (PWM_PWMIR) contains three bits which control the generation of the compare, rollover and FIFO empty interrupts.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0

R	0													CIE	RIE	FIE
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMIR field descriptions

Field	Description
31–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 CIE	Compare Interrupt Enable. This bit controls the generation of the Compare interrupt. 0 Compare Interrupt not enabled 1 Compare Interrupt enabled
1 RIE	Roll-over Interrupt Enable. This bit controls the generation of the Rollover interrupt. 0 Roll-over interrupt not enabled 1 Roll-over Interrupt enabled
0 FIE	FIFO Empty Interrupt Enable. This bit controls the generation of the FIFO Empty interrupt. 0 FIFO Empty interrupt disabled 1 FIFO Empty interrupt enabled

12.2.6.4 PWM Sample Register (PWMx_PWMSAR)

The PWM sample register (PWM_PWMSAR) is the input to the FIFO. 16-bit words are loaded into the FIFO. The FIFO can be written at any time, but can be read only when the PWM is enabled. The PWM will run at the last set duty-cycle setting if all the values of the FIFO has been utilized, until the FIFO is reloaded or the PWM is disabled. When a new value is written, the duty cycle changes after the current period is over.

A value of zero in the sample register will result in the PWMO output signal always being low/high (POUTC = 00 it will be low and POUTC = 01 it will be high), and no output waveform will be produced. If the value in this register is higher than the PERIOD + 1, the output will never be set/reset depending on POUTC value.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																SAMPLE															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMSAR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
SAMPLE	Sample Value. This is the input to the 4x16 FIFO. The value in this register denotes the value of the sample being currently used.

12.2.6.5 PWM Period Register (PWMx_PWMPR)

The PWM period register (PWM_PWMPR) determines the period of the PWM output signal. After the counter value matches PERIOD + 1, the counter is reset to start another period.

PWMO (Hz) = PCLK(Hz) / (period +2)

A value of zero in the PWM_PWMPR will result in a period of two clock cycles for the output signal. Writing 0xFFFF to this register will achieve the same result as writing 0xFFFE.

A change in the period value due to a write in PWM_PWMPR results in the counter being reset to zero and the start of a new count period.

NOTE

Settings PWM_PWMPR to 0xFFFF when PWMx_PWMCR REPEAT bits are set to non-zero values is not allowed.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PWMx_PWMPR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
PERIOD	Period Value. These bits determine the Period of the count cycle. The counter counts up to [Period Value] +1 and is then reset to 0x0000.

12.2.6.6 PWM Counter Register (PWMx_PWMCNR)

The read-only pulse-width modulator counter register (PWM_PWMCNR) contains the current count value and can be read at any time without disturbing the counter.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMCNR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Counter Value. These bits are the counter register value and denotes the current count state the counter register is in.

Chapter 13
Display, Imaging, and Camera

13.1 Display, Imaging, and Camera Overview

13.1.1 Overview

This section describes the high-level details of the peripherals that comprise the display, imaging, and camera interfaces on the chip. These peripherals are interconnected through the chip to support several application specific solutions that include the use of ML / AI accelerator and vision.

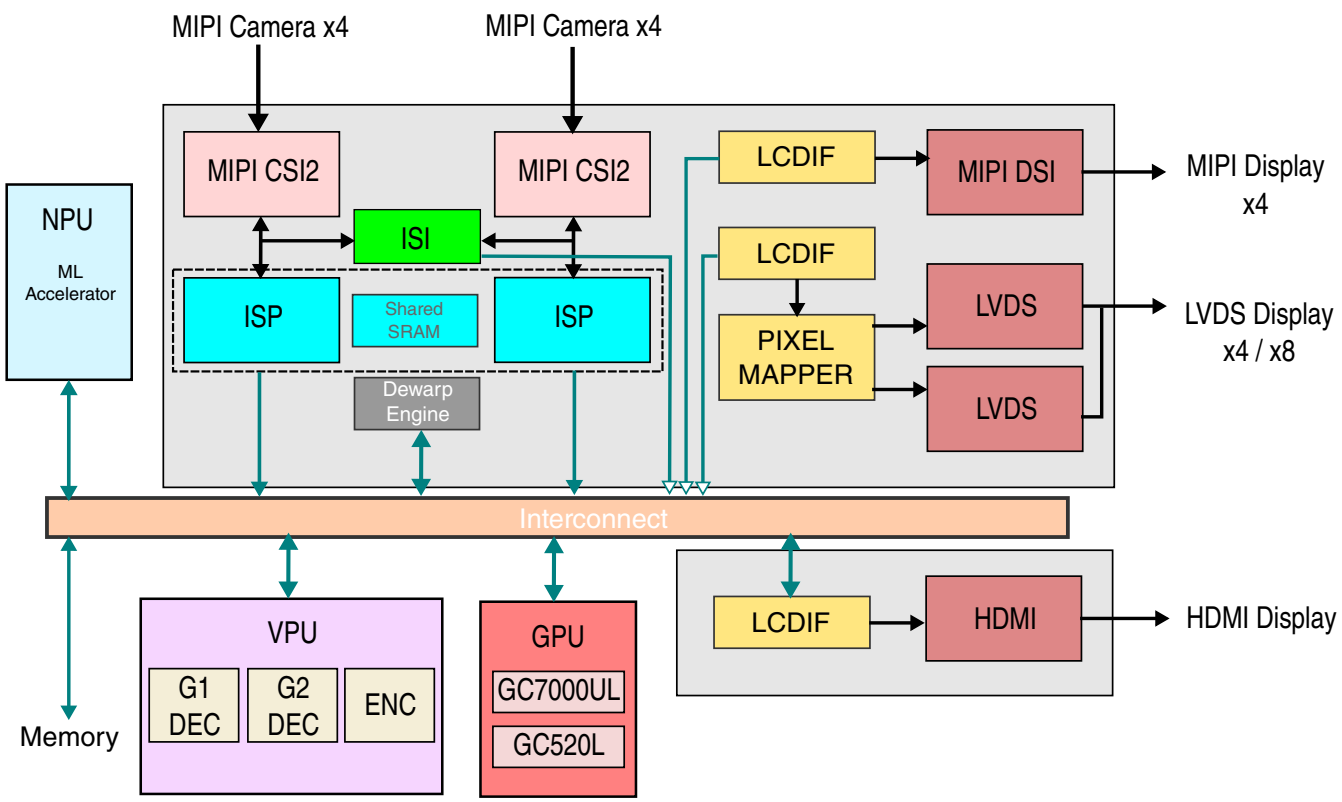

Figure 13-1. Display, Imaging, Camera I/F Diagram

13.1.2 Display Interface

The display and camera subsystem consists of several major blocks: LCDIF, LVDS Display Bridge and LVDS PHY, ISI, ISP, HDMI Tx Controller and PHY, MIPI CSI and MIPI DSI.

- The chip supports three LCDIF controllers. One LCDIF drives MIPI DSI, one LCDIF drives LVDS Tx, and one LCDIF drives HDMI Tx. The LCDIF is a simple display controller which has been widely used on i.MX chips. The key features of the display controller include:
  - Supports up to 1920x1200p60 display per LCDIF if no more than 2 instances used simultaneously, or 2x 1080p60 + 1x 4kp30 on HDMI if all 3 instances used simultaneously.
  - Supports 8-bit / 16-bit / 18-bit / 24-bit / 32-bit pixel depth
  - Supports DOTCLK mode for MIPI-DPI interface
  - Support one layer
- This chip supports one LVDS Tx display and Pixel Mapper. The LVDS port may be used as follows:
  - Single channel (4 lanes) supports resolutions up to 720p60.
  - Dual asynchronous channels (8 data, 2 clocks)
    - Supports resolutions up to 1920x1200p60.
    - Intended for a single panel with two interfaces, when transferring across two channels (even pixel/odd pixel).
    - The Pixel Mapper splits and reorders the pixels from the single LCDIF display output into an odd and even pixel stream.
- This chip supports one 4-lane MIPI DSI display with pixels from the LCDIF. The key features of the MIPI DSI (controller and PHY) include:
  - Compliant to MIPI-DSI standard v1.2
  - Support up to 4 data lanes
  - Maximum resolution limited to resolutions achievable with a 250MHz pixel clock and active pixel rate of 200Mpixel/s with 24-bit RGB. This includes resolutions such as:
    - 1080 p60
    - WUXGA (1920x1200) at 60 Hz
    - 1920x1440 at 60 Hz
    - UWHD (2560x1080) at 60 Hz
    - WQHD (2560x1440) can be supported by reduced blanking mode
  - Support 80Mbps - 1.5Gbps data rate in high speed operation
  - Support 10Mbps data rate in low power operation
- The ISI is a simple camera interface. It supports image processing and transfer via a bus master interface for up to 2 cameras. The key features of the ISI include:

- Many standard pixel formats commonly used in many camera input protocols
- Programmable resolutions up to 4K
- Image processing for
  - 2 processed camera stream at 1080p30
  - 2 unprocessed camera stream (i.e. no scaling) at 4Kp30, depending on system load and use case
- Image down scaling via decimation and bi-phase filtering
- Color space conversion
- Interlaced to progressive conversions

- The chip supports two instances of an ISP. Key features of each ISP include:
  - Bayer de-mosaicing and filtering (including denoising, sharpening and blurring)
  - Defect pixel cluster correction
  - Color processor
  - Chromatic aberration correction
  - Denoise
  - Histogram
  - Lens shading correction
  - Wide Dynamic Range (local tone mapping)
  - Color noise removal
  - Automatic white balance measurements (AWB)
  - Exposure measurement for AE (AEC/AGC) Auto focus measurement (AF)
  - High Dynamic Range (HDR), supported with:
    - Native HDR sensor with compand output
    - 2-exposure and 3-exposure Line-interleaved (staggered) HDR:
      - Full resolution for multiple exposures is output by the image sensor, and the sensor outputs are interleaved on a per-line basis. No impact to vertical resolution, but frame rate is reduced by a factor of 2 (for 2-exposure HDR) or 3 (for 3-exposure HDR).
  - High Dynamic Range (HDR) is not supported with:
    - 2-exposure Line-interlaced HDR
      - Even and odd rows are from two different exposures, reducing vertical resolution of each exposure by a factor of 2, but without impact to frame rate.
  - When one ISP is used, it supports:
    - maximum resolution up to 12MP (4096x3072)
    - maximum average pixel rate (averaged over blanking time) up to 300Mpixel/s at nominal voltage and 375Mpixel/s at overdrive voltage
    - maximum pixel clock (considering blanking time) up to 400MHz at nominal voltage and 500 MHz at overdrive voltage
  - When two ISPs are used simultaneously, each supports:
    - maximum resolution up to 1080p (1936x1188)

        - maximum average pixel rate (averaged over blanking time) up to 187.5Mpixel/s at nominal and overdrive voltage
        - maximum pixel clock (considering blanking time) up to 266MHz at nominal and overdrive voltage
    - A separate Dewarp engine is also supported, capable of reading from and writing to DRAM to adjust an image such as from a fisheye lens at resolution up to the maximum resolution supported by the ISP. One fisheye lens is supported at up to 4kp30 or 12MP (4096x3072) at 30fps.
- The chip supports two 4-lane MIPI CSI2 camera input. The key features of the MIPI CSI2 (controller and PHY) include:
    - Compliant to MIPI-CSI2 standard
    - Support up to 4 data lanes
    - When one ISP is used, MIPI CSI interface 1 supports:
        - Pixel clock up to 400MHz at nominal voltage and 500MHz at overdrive voltage
        - 80Mbps - 1.5Gbps per lane data rate in high speed operation
    - When two ISPs are used, both MIPI CSI interfaces supports:
        - Pixel clock up to 266MHz at nominal and overdrive voltage
        - 80Mbps - 1.5Gbps per lane data rate in high speed operation (maximum speed of 1.5Gbps per lane is only supported when 2 data lanes are used)
    - When used in conjunction with output to the ISP, the RAW8, RAW10, RAW12, and RAW14 image formats are supported
    - When used in conjunction with output to the ISI, the YUV420 (8-bit and 10-bit), YUV422 (8-bit and 10-bit), RGB565, RGB666, RGB888 image formats are supported
    - Support 10Mbps data rate in low power operation
- The chip supports a HDMI 2.0a Tx interface (controller and PHY). It supports following features:
    - HDMI 2.0a complaint
    - Supports a maximum display resolution of 4Kp30
    - HDMI 2.1 eARC is also supported

13.1.3 Graphics Processing Unit (GPU)

The GPU consists of a 3D graphics core and a 2D graphics core.

3D graphics core features include:
- Two Shader Execution Units
- Supports OpenGL ES 1.1, 2.0, 3.0, 3.1
- Supports OpenCL 3.0
- Supports OpenVG 1.1

- Supports OpenGL 4.0
- Supports EGL 1.5
- Supports Vulkan 1.1
- Supports tile format

2D graphics core features include:

- Supports multi-source composition
- Supports one-pass filter
- Supports tile format from 3D graphics core

13.1.4 Video Processing Unit (VPU)

The chip supports video decoding for various video format using the Hantro G2 + G1. Features include:

- 1080p60 VP9 Profile 0, 2 (10 bit) decoder (Hantro G2), input video stream can be 10-bit, the output decoded video is always 8-bit after post-processing in G2 core
- 1080p60 HEVC/H.265 decoder (Hantro G2)
- 1080p60 AVC/H.264 Baseline, Main, High decoder (Hantro G1)
- 1080p60 VP8 decoder (Hantro G1)

The video encoding features include:

- 1080p60 AVC/H.264 Encoder
- 1080p60 HEVC/H.265 Encoder

13.1.5 Image Signal Processor (ISP)

The Image Signal Processors (ISP) receive an image from the camera sensor and converts it from raw Bayer to YUV so it can be processed by the chip. The ISP also provides additional processing to improve the image quality. Supported image quality processes include:

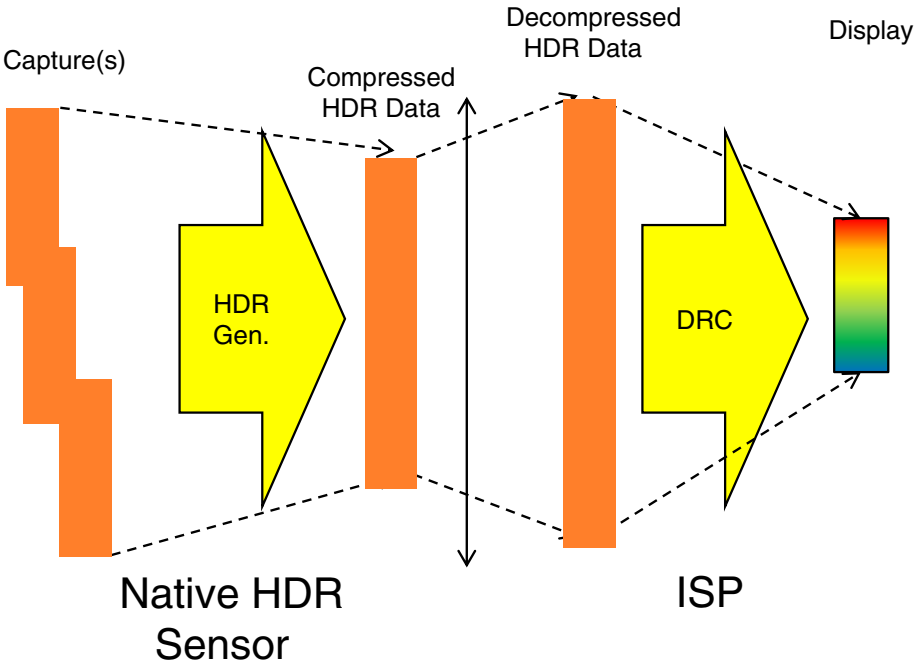
- HDR to retain image details in high contrast scenes
- Dewarp to correct the image geometry caused by lens distortion (e.g. fisheye lens)
- Image enhancements (e.g. AWB, Denoise, AE, etc)

There are two instances of ISP on the chip and each is connected to separate instances of MIPI CSI. Both ISP instances support YCbCr420, YCbCR422, RAW8, RAW10, and RAW12 output pixel formats. The supported resolutions and formats of the two ISPs are shown in the table below:

Table 13-1. Supported Resolution and Formats - 1 ISP

Resolution	Without HDR	2-exposure line-interleaved HDR	3-exposure line-interleaved HDR
12MP (4096x3072)	30 fps	15 fps	10 fps
4k (3848x2168)	45 fps	22.5 fps	15 fps
1080p (1936x1198)	120 fps	60 fps	40 fps

Table 13-2. Supported Resolution and Formats - 2 ISPs used simultaneously (capabilities for each ISP)



Resolution	Without HDR	2-exposure line-interleaved HDR	3-exposure line-interleaved HDR
12MP (4096x3072)	-	-	-
4k (3848x2168)	-	-	-
1080p (1936x1198)	80 fps	40 fps	27 fps

13.1.5.1 High-Dynamic Range (HDR)

The ISP supports the following HDR generation for high-quality on-the-fly dynamic range compression (DRC):

- Native HDR Sensor with compand output (max 14 bit compressed input)
- Digital Overlap High-Dynamic Range Sensor (DOL-HDR), staggered HDR

For Native HDR sensors, the multi-exposure stitching is done internally and has line buffers.

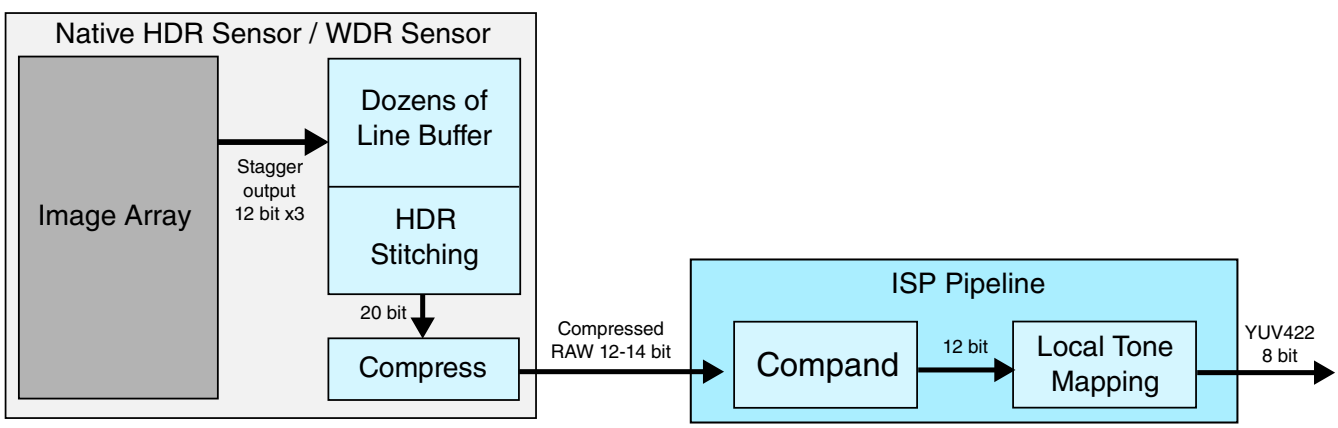


Figure 13-2. Native HDR

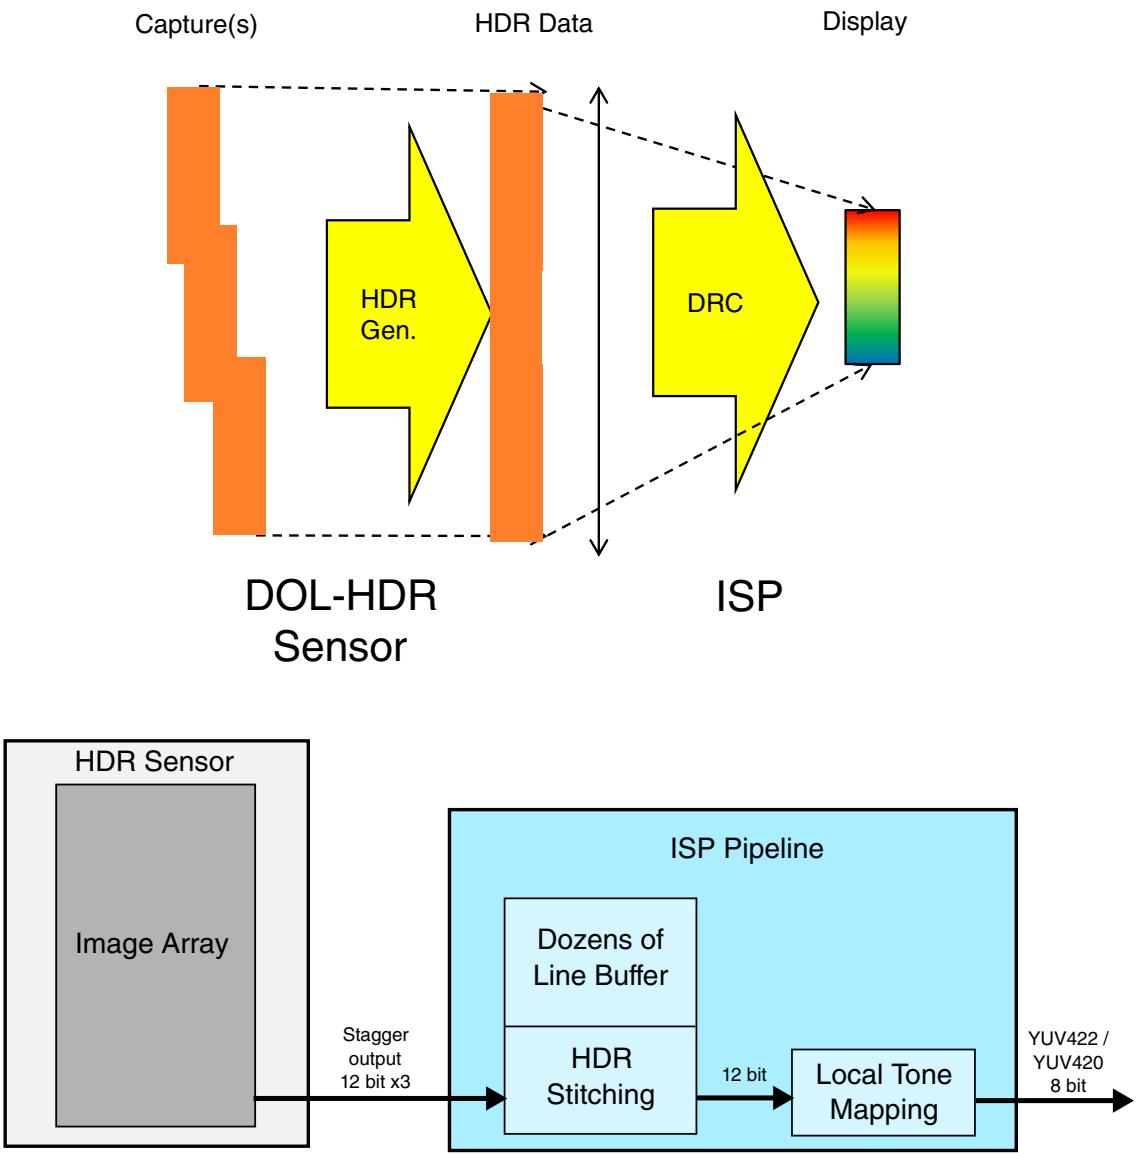

Figure 13-3. DOL-HDR

For 2 and 3-exposure DOL / Stagger HDR Sensors, the sensor outputs multi-exposure staggered pixels. The ISP allocates line buffers to buffer the exposure data and then does the stitching.

13.1.6 Dewarp Engine

A Dewarp Engine is supported on the chip that has a configurable index map to implement many different transforms to include:

- Wide FOV correction
- Lens distortion from low-cost lenses
- Keystone correction

- Fisheye correction
- Scaling and rotation

Dewarp supports one camera up to 4k or 12 MP (4096x3072) at 30 fps. Dewarp also supports two cameras up to 1080p60. YUV422 and YUV420 input and output formats are also supported

13.1.7 Neural Processing Unit (NPU)

The Neural Processing Unit (NPU) is a Machine Learning (ML) accelerator. The NPU accelerates vision image processing functions and provides enhanced performance for real-time use cases. The primary APIs supported are OpenVX 1.2.

13.2 MEDIA BLK_CTRL

13.2.1 Overview

The MEDIAMIX domain contains control and status registers known as Media Block Control (MEDIA BLK_CTRL). These registers have miscellaneous top-level controls for peripherals within the MEDIAMIX domain. Some of these controls includes clocking, interrupt, and reset sources. Please see the clock control chapter and interrupt chapter for more information regarding the clock input sources and IRQ event mapping to MEDIAMIX.

13.2.1.1 Block Diagram

The HDMI BLK_CTRL interface connects to the MEDIAMIX domain peripherals. A block diagram illustrating the MEDIAMIX domain is shown below.

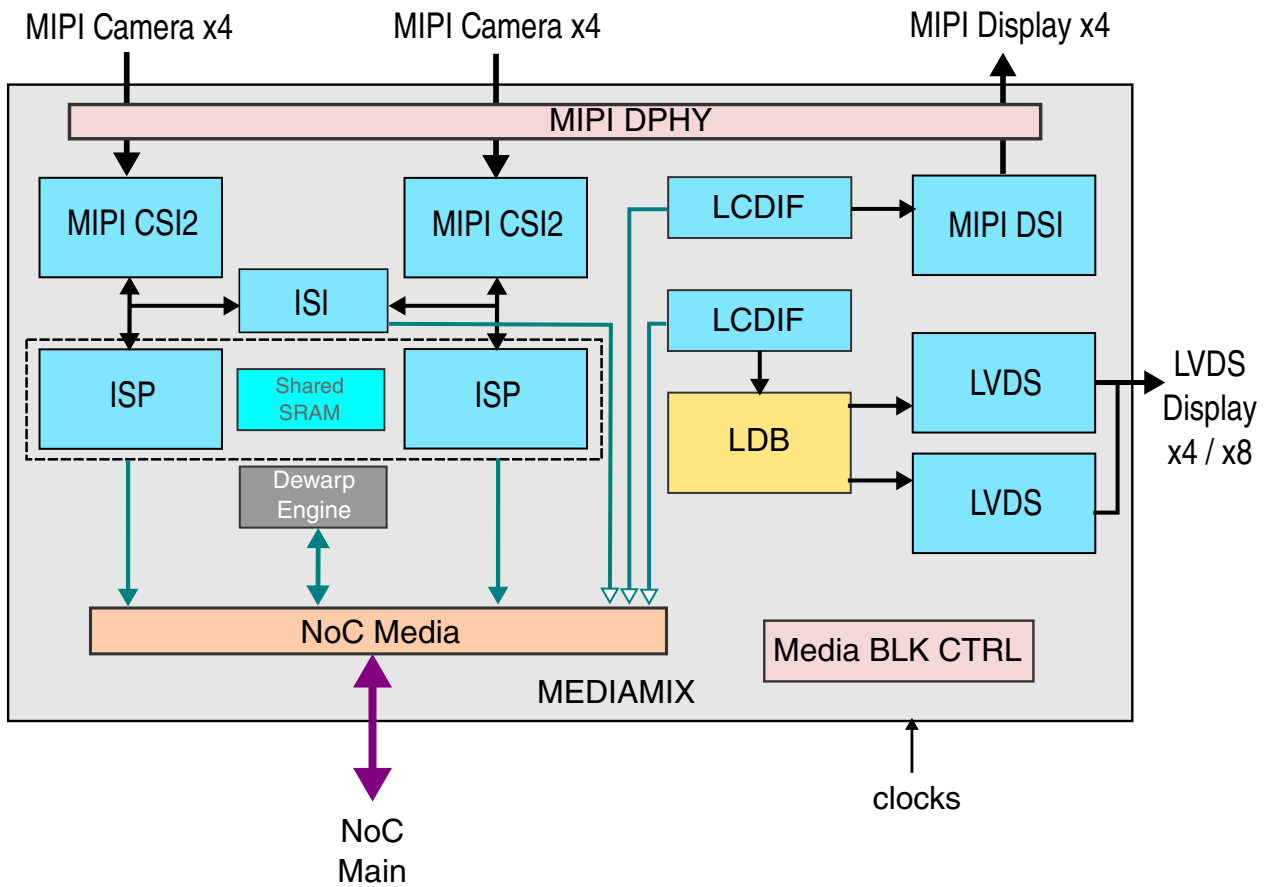

Figure 13-4. MEDIAMIX Block Diagram

13.2.2 Clocks and Resets

The Media BLK_CTRL contains clock distribution and gating controls, as well as reset handling to several of the MEDIAMIX peripherals. Please see related clock and reset controls in the BLK_CTRL register description. For more information about the input clocks, system-level resets, and IRQ to the domain, please see the related block guide and system-level assignments in the control blocks for clocks, reset, and IRQ assignments.

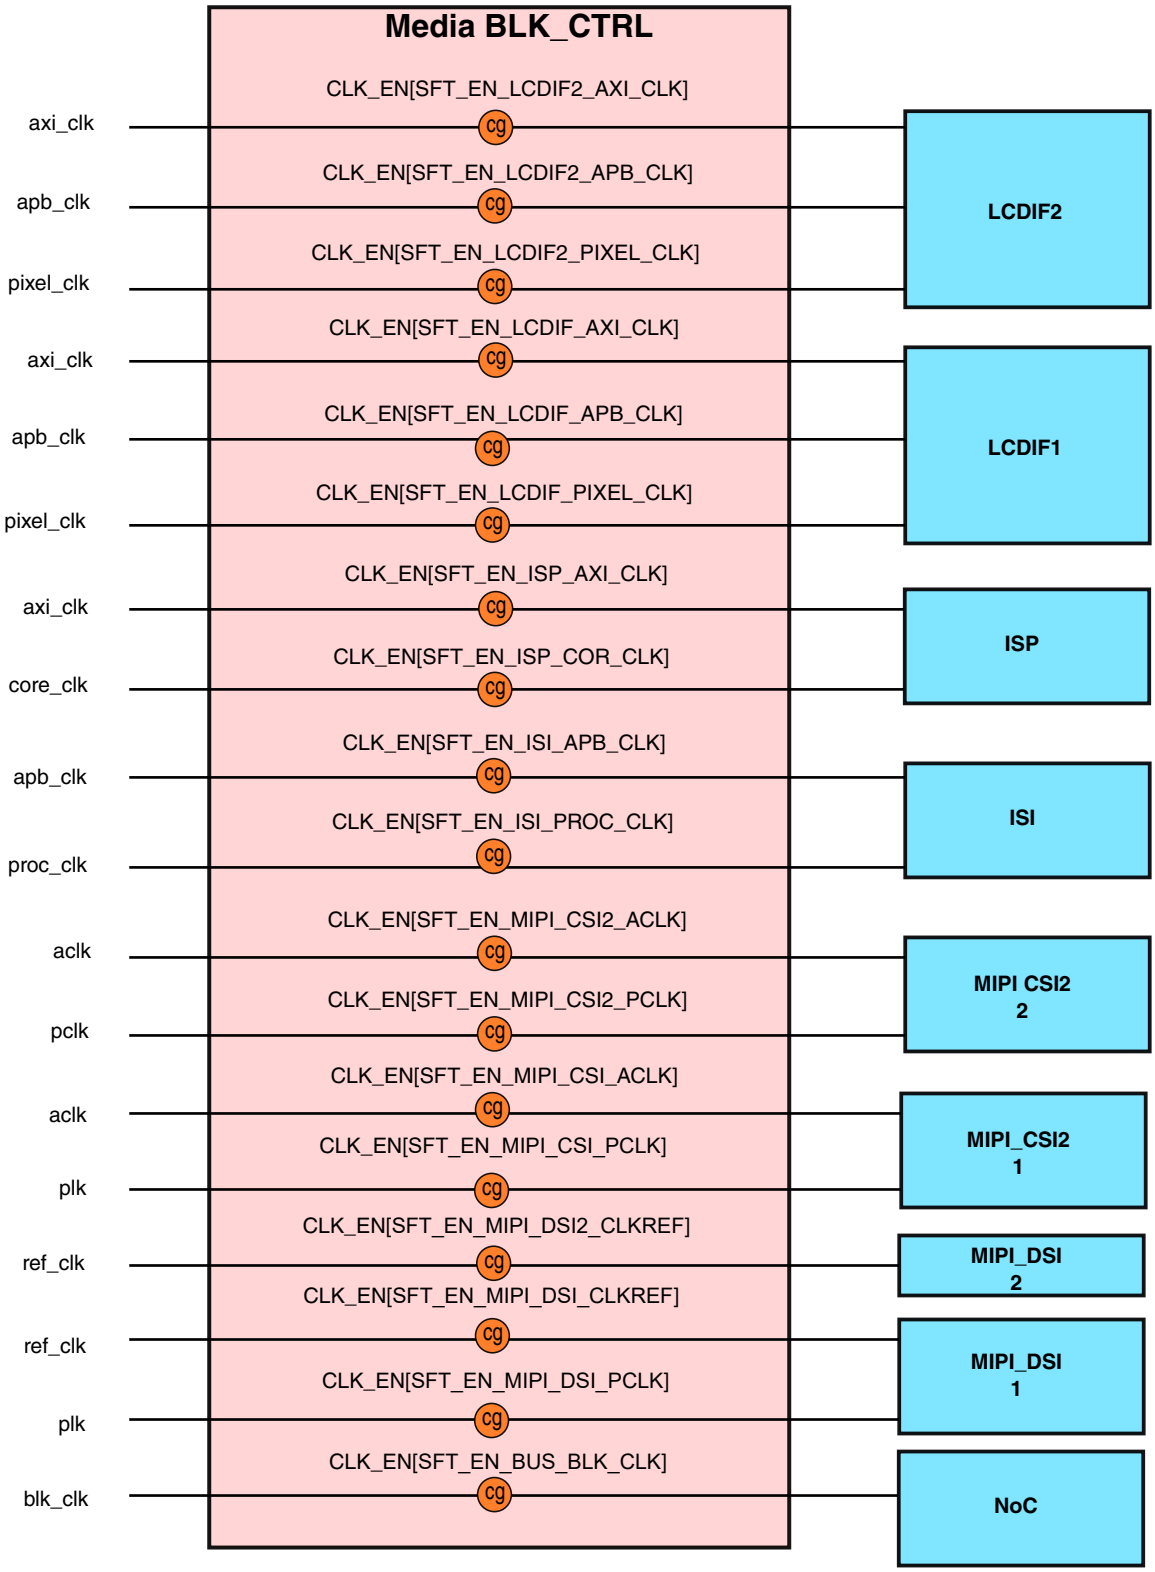

Figure 13-5. Media BLK_CTRL Clocks

13.2.3 Memory Map and register definition

This section includes the MEDIA BLK_CTRL module memory map and descriptions of all registers.

13.2.3.1 Register descriptions

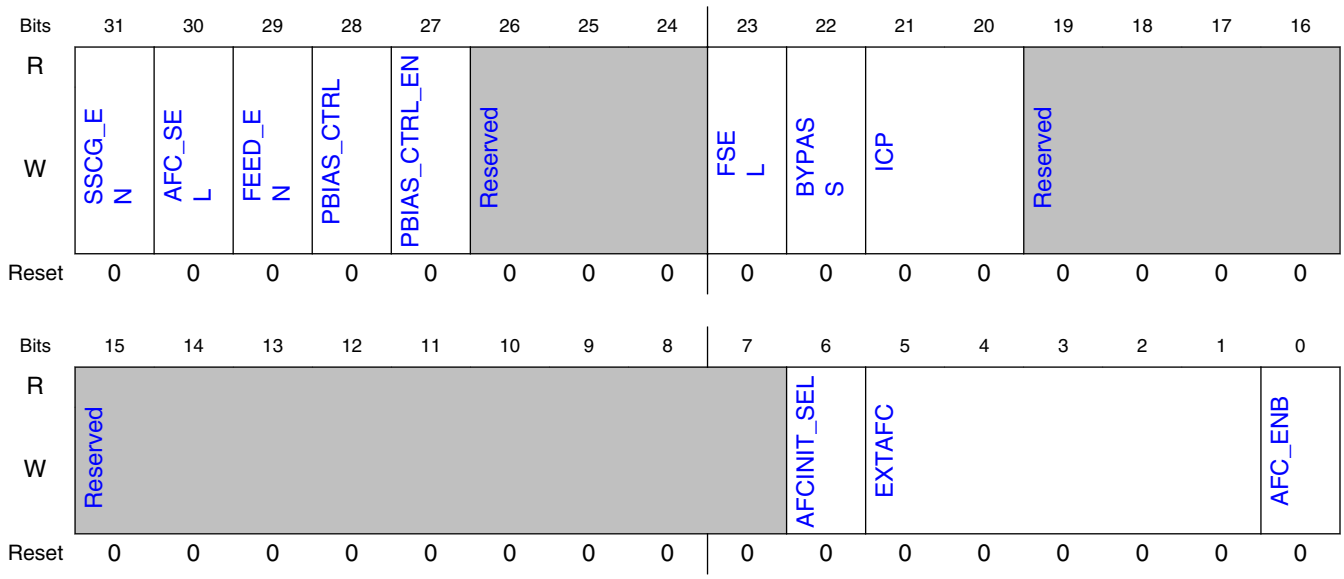
12-3 PMS_M	PMS_M Specifies the PLL PMS value for the M divider **NOTE:** The programmable divider range should be within 64 to 1023 to ensure PLL stability. **NOTE:** The M and P divider values should be considered together to ensure VCO ouput frequency (VCO_out) range is between 1050 MHz to 2100 MHz. Please refer to the topic DPHY PLL for more information. 000000000b - Do not program, can cause malfunction 000011001b - Divide by 25 000011010b - Divide by 26 000011011b - Divide by 27 000011100b - Divide by 28 000011101b - Divide by 29 001111010b - Divide by 122 001111011b - Divide by 123 001111100b - Divide by 124 001111101b - Divide by 125
2-0 PMS_S	PMS_S Specifies the PLL PMS value for the S divider Please refer to the topic DPHY PLL for more information. 00b - Divide by 1 01b - Divide by 2 10b - Divide by 4 11b - Divide by 8

13.2.3.1.6 Master PLL Control Low Register (MIPI_M_PLLCTL_LOW)



13.2.3.1.6.1 Offset

Register	Offset
MIPI_M_PLLCTL_LOW	10h

13.2.3.1.6.2 Function

This GPR is the lower 32-bits for the DPHY PLL Master PLL Control Register

13.2.3.1.6.3 Diagram

13.2.3.1.6.4 Fields

Field	Function
31 SSCG_EN	Enable pin for dithered mode. (Active-high)
30 AFC_SEL	AFC operation mode select pin Default value is 1
29 FEED_EN	FEED_OUT enable pin (active-high) Default value is 0
28 PBIAS_CTRL	PBIAS pull-down initial voltage control pin PBIAS_CTRL=1 : 0.50*VDD PBIAS_CTRL=0 : 0.67*VDD (default)
27 PBIAS_CTRL_EN	PBIAS voltage pull-down enable pin (active-high) Default value is 0
26-24 —	- -
23 FSEL	Monitoring frequency select pin FSEL = 0 for FEED_OUT = FREF FSEL = 1 for FEED_OUT = FEED
22 BYPASS	BYPASS BYPASS = 1, bypass mode is enabled If FOUT=FIN, BYPASS = 0, PLL operates normally
21-20	Controls the charge-pump current

Table continues on the next page...

Field	Function
ICP	Default value is 0
19-7 —	- -
6 AFCINIT_SEL	AFC initial delay select pin AFCINIT_SEL = 0 : nominal delay time (default) AFCINIT_SEL = 1 : increase delay time
5-1 EXTAFC	EXTAFC AFC_ENB =1, AFC is disabled. FVCO is calibrated manually by EXTAFC[4:0]
0 AFC_ENB	Automatic Frequency Control Enable/Disable 0b - AFC is enabled 1b - AFC is disabled

13.2.3.1.7 Master PLL Control High Register (MIPI_M_PLLCTL_HIGH)

13.2.3.1.7.1 Offset

Register	Offset
MIPI_M_PLLCTL_HIGH	14h

13.2.3.1.7.2 Function

This GPR is for the higher 32-bits of the DPHY Master PLL Control Register

13.2.3.1.7.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

13.3 LCD Interface (LCDIF)

13.3.1 Overview

The LCD Interface (LCDIF) is a system master that fetches graphics stored in memory and display them on a TFT LCD panel. A wide range of panel sizes is supported and the timing of the interface signals is highly configurable. Graphics are read directly from memory. Graphics may be encoded in a variety of formats to optimize memory usage.

13.3.1.1 Block diagram

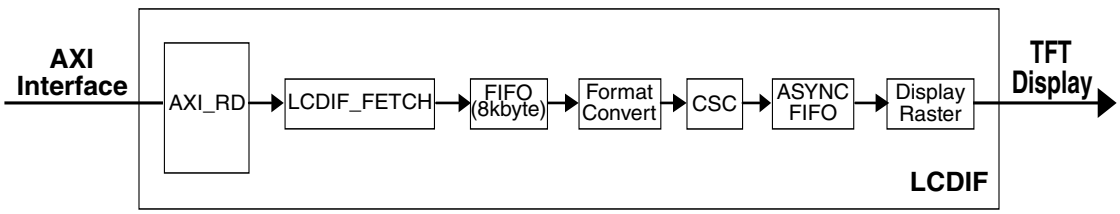

Figure 13-6. LCDIF block diagram

The above block diagram shows the LCDIF architecuture. The input source can be configured with:

- Horizontal and vertical size of graphic
- Position of graphic on the panel
- Address of graphic in memory
- Color formats or Color palettes

The values in the registers can be changed at any time, the panel content will be updated automatically in the panel refresh cycle when SHADOW_EN bit is set.

13.3.1.2 Features

The LCDIF includes the following features:

- The display mode supports DOTCLK mode only.
- One layer can support:
  - Programmable plane size (Width/Height/Pitch) and X/Y offset on the panel.
  - Index color support (1/2/4/8 bpp).

13.3.2 Functional description

The LCDIF is a master on the bus fabric; it fetches graphic source information directly from memory and sends data to a TFT LCD pannel.

As the LCDIF is a master on the NIC, it can access directly any memory or device connected to the NIC as a slave. Therefore, any compatiable graphic stored anywhere on-chip can be displayed on the connected TFT LCD panel with no further intervention from CPU.

13.3.2.1 Graphics and data format

The memory location of the graphic that is displayed on the layer is defined by register in the control descriptor for the layer . This 32-bit value can contain the address of any memory location in the memory map of the system.

The format of the data that describes the graphic is defined by the BPP bit field in the control descriptor for the layer . By choosing an appropriate format, it is possible to optimize the memory required by the graphics in use.

The CSC module receives pixels in any color space and can convert the pixels into any of RGB, YUV, or YCbCr color spaces.

All coefficients are programmable and in the two's compliment notation. The output pixels are passed onto the LUT and rotation engine for further processing.

The following equations indicate the CSC modules ALU architecture.

Selecting RGB output in CSC0_CTRL[CSC_MODE] configures the ALU in the following manner:

R = A1(Y-D1) + A2(U-D2) + A3(V-D3)

G = B1(Y-D1) + B2(U-D2) + B3(V-D3)

B = C1(Y-D1) + C2(U-D2) + C3(V-D3)

Selecting YUV output configures the ALU in the alternate manner:

Y = A1*R + A2*G + A3*B + D1

U = B1*R + B2*G + B3*B + D2

V = C1*R + C2*G + C3*B + D3

Saturation of each color channel is checked and corrected for excursions outside the nominal color space. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

13.3.2.2 Clocks

The table below shows the clocks described in this module:

Table 13-3. Clocks

Clocks	Description
pix_clk	Pixel Clock This clock should be configured according to TFT panel specification for supported display resolution
apb_clk	System Bus access clock
b_clk	LCDIF peripheral access bus clock connected to apb_clk

13.3.2.3 Reset

There is one asynchronous chip reset input to LCDIF, all the internal registers should be forced into their reset state when reset_n is active low.

There is one software reset bit (CTRL[SW_RESET]), which can reset all the internal registers except user configured registers.

13.3.2.4 Interrupts

There are two output interrupt signals (lcdif_d0_irq and lcdif_d1_irq) in this module. They have similar functions and can be used for different CPU domain in SoC.

The VSYNC interrupt flag indicates that the LCDIF has begun the next panel refresh period.

The UNDERRUN interrupt flag indicates the TXFIFO for display in underrun condition.

The VS_BLANK interrupt flag gives indication of the start of the vertical blanking period.

There are FIFO_EMPTY, DMA_DONE and DMA_ERR interrupt flags for each layer which indicate the status of pixel FIFO, frame buffer fetch and AXI interface respectively.

13.3.2.5 External Signals

There are no external signals pinned out for LCDIF.

13.3.2.6 Application information

The figure below shows the details of software flow for the LCDIF module.

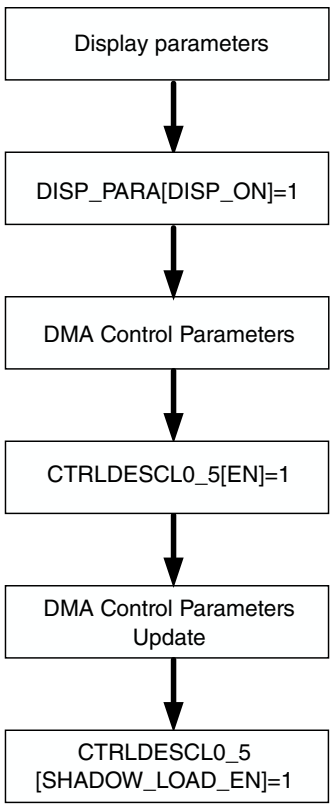

Figure 13-7. Software flow diagram

13.3.3 Memory Map and register definition

This section includes the LCDIF module memory map and detailed descriptions of all registers.

13.3.3.1 LCDIF register descriptions

13.3.3.1.1 LCDIF memory map

13.3.3.1.2 LCDIF display control Register (CTRL)

13.3.3.1.2.1 Offset

Register	Offset	Description
CTRL	0h	LCDIF display control Register
CTRL_SET	4h	Writing a 1 to a bit in this register sets the corresponding bit in CTRL

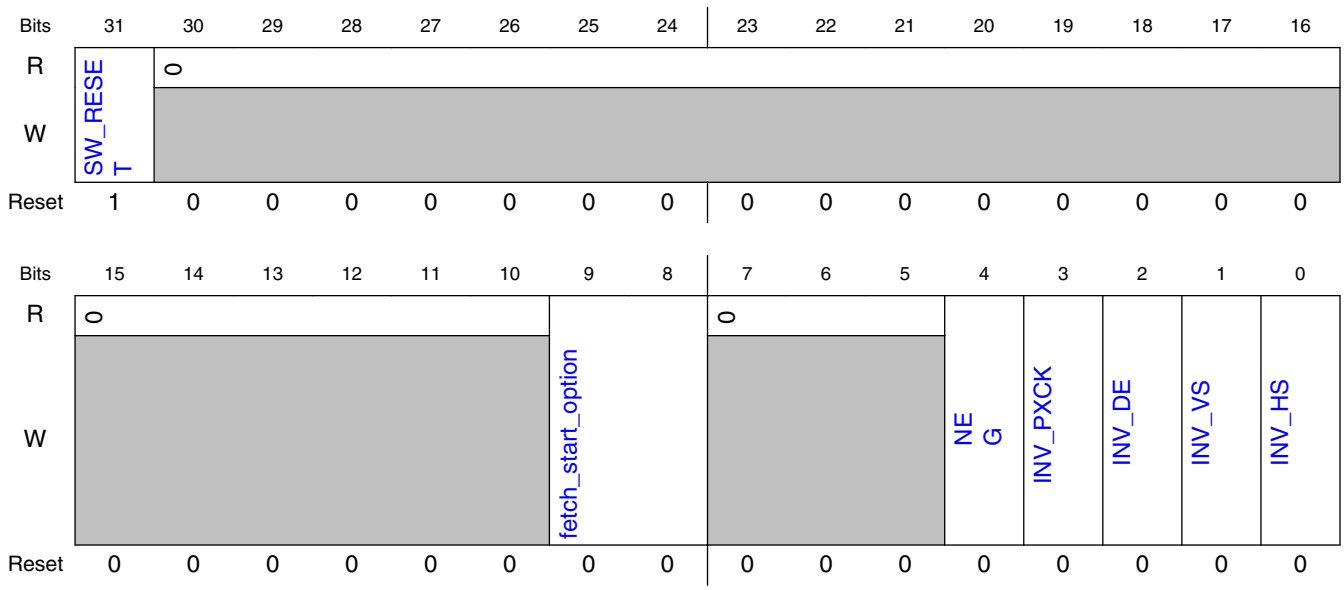

Table continues on the next page...

Register	Offset	Description
CTRL_CLR	8h	Writing a 1 to a bit in this register clears the corresponding bit in CTRL
CTRL_TOG	Ch	Writing a 1 to a bit in this register toggles the corresponding bit in CTRL

13.3.3.1.2.2 Function

This register control the polarity for HSYNC/VSYNC/DE of display.

13.3.3.1.2.3 Diagram

13.3.3.1.2.4 Fields

Field	Function
31 SW_RESET	SW_RESET Software reset, high active. When write 1 ,all logical will be reset. 0b - No action 1b - All LCDIF internal registers are forced into their reset state. User registers are not affected.
30-10 —	Reserved
9-8 fetch_start_option	Indicates when to start fetching for new frame. This signals also decide the shadow load, fifo clear time 00b - fetch start as soon as FPV begins(as the end of the data_enable) 01b - fetch start as soon as PWV begins 10b - fetch start as soon as BPV begins 11b - fetch start as soon as RESV begins(still have hsync blanking for margin)

Table continues on the next page...

Field	Function
7-5 —	Reserved
4 NEG	Indicates if value at the output (pixel data output) needs to be negated. 0b - Output is to remain same 1b - Output to be negated
3 INV_PXCK	Polarity change of Pixel Clock. 0b - Display samples data on the falling edge 1b - Display samples data on the rising edge
2 INV_DE	Invert Data Enable polarity 0b - Data enable is active high 1b - Data enable is active low
1 INV_VS	Invert Vertical synchronization signal. 0b - VSYNC signal not inverted (active HIGH). 1b - Invert VSYNC signal (active LOW).
0 INV_HS	Invert Horizontal synchronization signal. 0b - HSYNC signal not inverted (active HIGH). 1b - Invert HSYNC signal (active LOW).

13.3.3.1.3 Display Parameter Register (DISP_PARA)

13.3.3.1.3.1 Offset

Register	Offset
DISP_PARA	10h

13.3.3.1.3.3 Fields

Field	Function
31 DISP_ON	Display panel On/Off mode. 0b - Display Off. 1b - Display On.
30 SWAP_EN	output data swap enable. 0b - swap disable 1b - swap enbale, output data will swap the high 16bits with the low 16bits.
29-26 LINE_PATTERN	LCDIF line output order. 0000b - RGB/YUV. 0001b - RBG. 0010b - GBR. 0011b - GRB/UYV. 0100b - BRG. 0101b - BGR. 0110b - RGB555. 0111b - RGB565. 1000b - YUYV at [16:0]. 1001b - UYVY at [16:0]. 1010b - YVYU at [16:0]. 1011b - YUYV at [16:0]. 1100b - YUYV at [23:8]. 1101b - UYVY at [23:8]. 1110b - YVYU at [23:8]. 1111b - YUYV at [23:8].
25-24 DISP_MODE	LCDIF operating mode. 00b - Normal mode. Panel content controlled by layer configuration. 01b - Test Mode1.(BGND Color Display) 10b - Test Mode2.(Column Color Bar) 11b - Test Mode3.(Row Color Bar)
23-16 BGND_R	Red component of the default color displayed in the sectors where no layer is active.
15-8 BGND_G	Green component of the default color displayed in the sectors where no layer is active.
7-0 BGND_B	Blue component of the default color displayed in the sectors where no layer is active.

13.3.3.1.4 Display Size Register (DISP_SIZE)

13.3.3.1.4.1 Offset

Register	Offset
DISP_SIZE	14h

13.3.3.1.4.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	DELTA_X															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.3.3.1.4.3 Fields

Field	Function
31-16 DELTA_Y	Sets the display size vertical resolution in pixels.
15-0 DELTA_X	Sets the display size horizontal resolution in pixels.

13.3.3.1.5 Horizontal Sync Parameter Register (HSYN_PARA)

13.3.3.1.5.1 Offset

Register	Offset
HSYN_PARA	18h

13.3.3.1.5.2 Function

HSYN_PARA register sets timing parameters related to the horizontal synchronization signal generation for the TFT. The fields FP_H, BP_H, and PW_H stand for HSYNC signal front-porch, back-porch, and active pulse width, respectively.

13.3.3.1.5.3 Diagram

R W	FP_H															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

13.3.3.1.5.4 Fields

Field	Function
31-16 BP_H	HSYNC back-porch pulse width (in pixel clock cycles). Pulse width has a minimum value of 1.
15-0 FP_H	HSYNC front-porch pulse width (in pixel clock cycles). Pulse width has a minimum value of 1.

13.3.3.1.6 Vertical Sync Parameter Register (VSYN_PARA)

13.3.3.1.6.1 Offset

Register	Offset
VSYN_PARA	1Ch

13.3.3.1.6.2 Function

VSYN_PARA register sets timing parameters of the TFT related to the vertical synchronization signal generation. The fields FP_V, BP_V, and PW_V stand for VSYNC signal front-porch, back-porch, and active pulse width, respectively.

13.3.3.1.6.3 Diagram

R W	FP_V															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

13.3.3.1.6.4 Fields

Field	Function
31-16 BP_V	VSYNC back-porch pulse width (in horizontal line cycles). Pulse width has a minimum value of 1.
15-0 FP_V	VSYNC front-porch pulse width (in horizontal line cycles). Pulse width has a minimum value of 1.

13.3.3.1.7 Vertical and Horizontal Pulse Width Parameter Register (VSYN_HSYN_WIDTH)

13.3.3.1.7.1 Offset

Register	Offset
VSYN_HSYN_WIDTH	20h

13.3.3.1.7.2 Function

VSYN_PARA register sets timing parameters of the TFT related to the vertical synchronization signal generation. The fields FP_V, BP_V, and PW_V stand for VSYNC signal front-porch, back-porch, and active pulse width, respectively.

13.3.3.1.7.3 Diagram

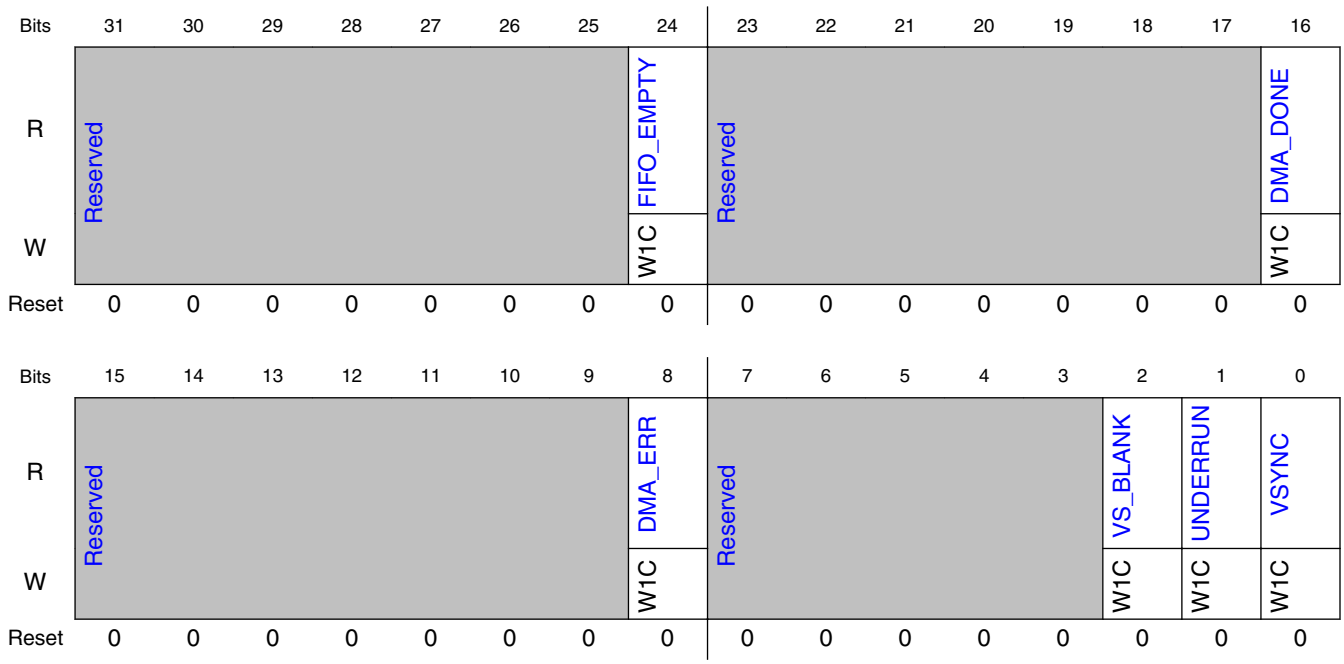
R W	PW_H															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

13.3.3.1.7.4 Fields



Field	Function
31-16 PW_V	VSYNC active pulse width (in horizontal line cycles). Pulse width has a minimum value of 1.
15-0 PW_H	HSYNC active pulse width (in pixel clock cycles). Pulse width has a minimum value of 1.

13.3.3.1.8 Interrupt Status Register for domain 0 (INT_STATUS_D0)

13.3.3.1.8.1 Offset

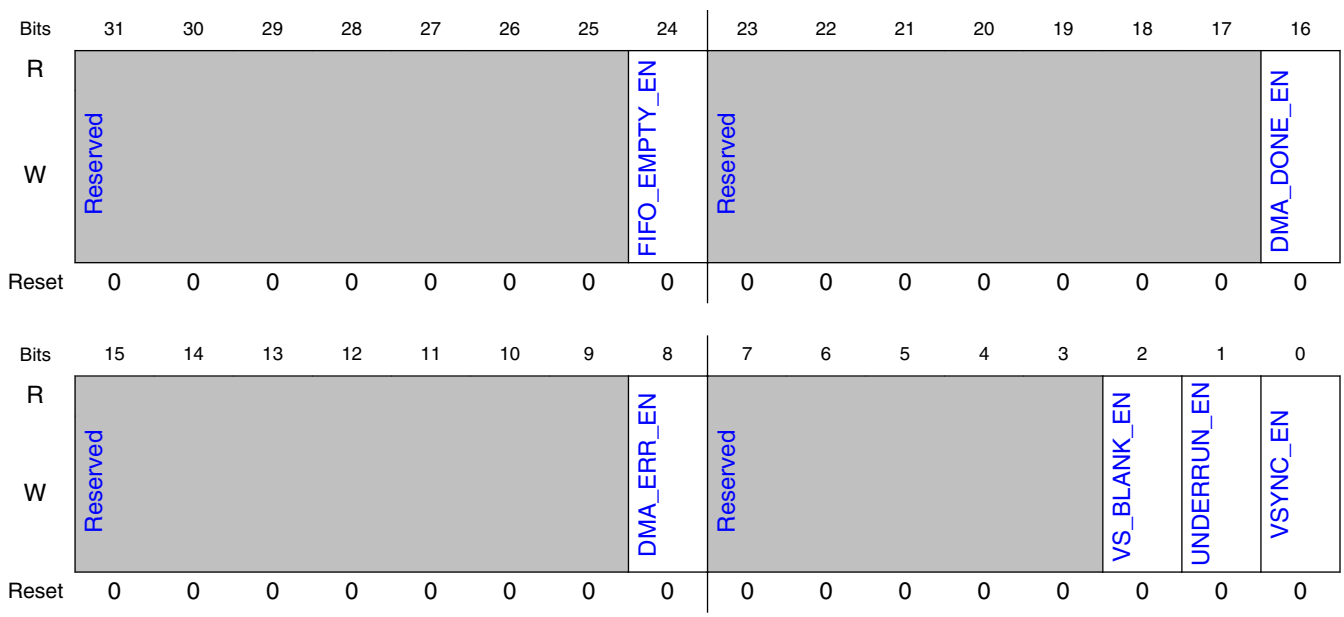
Register	Offset
INT_STATUS_D0	24h

13.3.3.1.8.2 Diagram

13.3.3.1.8.3 Fields

Field	Function
31-25 —	Reserved
24 FIFO_EMPTY	Interrupt flag to indicate that which FIFO in the pixel blending underflowed. • bit 0 -> FIFO has underflowed
23-17 —	Reserved
16 DMA_DONE	Interrupt flag to indicate that which PLANE has fetched the last pixel from memory. • bit 0 -> PLANE1 has fetched done
15-9 —	Reserved
8 DMA_ERR	Interrupt flag to indicate that which PLANE has Read Error on the AXI interface. • bit 0 -> PLANE1 has Read Error
7-3 —	Reserved
2 VS_BLANK	Interrupt flag to indicate vertical blanking period.
1 UNDERRUN	Interrupt flag to indicate the output buffer underrun condition.

Table continues on the next page...



Field	Function
0 VSYNC	Interrupt flag to indicate that the vertical synchronization phase(The beginning of a frame).

13.3.3.1.9 Interrupt Enable Register for domain 0 (INT_ENABLE_D0)

13.3.3.1.9.1 Offset

Register	Offset
INT_ENABLE_D0	28h

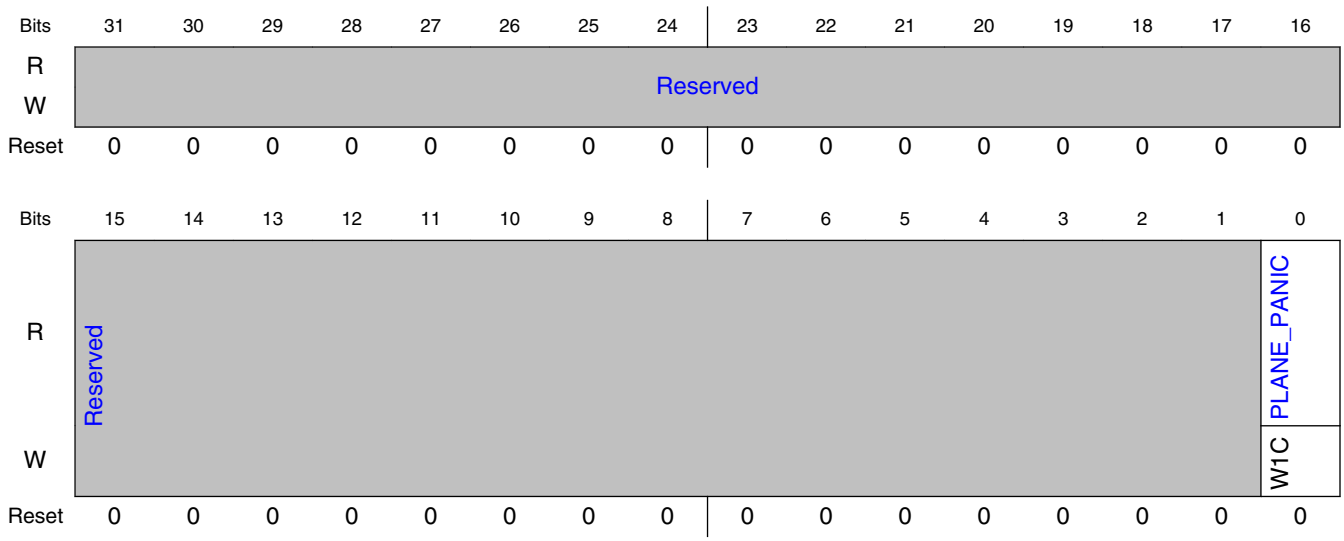
13.3.3.1.9.3 Fields

Field	Function
31-25 —	Reserved
24 FIFO_EMPTY_EN	Enable Interrupt flag to indicate that which FIFO in the pixel blending underflowed. • bit 0 -> FIFO1 underflowed enable
23-17	Reserved

Table continues on the next page...



Field	Function
—	
16 DMA_DONE_EN	Enable Interrupt flag to indicate that which PLANE has fetched the last pixel from memory. • bit 0 -> PLANE1 fetched done enable
15-9 —	Reserved
8 DMA_ERR_EN	Enable Interrupt flag to indicate that which PLANE has Read Error on the AXI interface. • bit 0 -> PLANE1 Read Error enable
7-3 —	Reserved
2 VS_BLANK_EN	Enable Interrupt flag to indicate vertical blanking period.
1 UNDERRUN_EN	Enable Interrupt flag to indicate the output buffer underrun condition.
0 VSYNC_EN	Enable Interrupt flag to indicate that the vertical synchronization phase(The beginning of a frame).

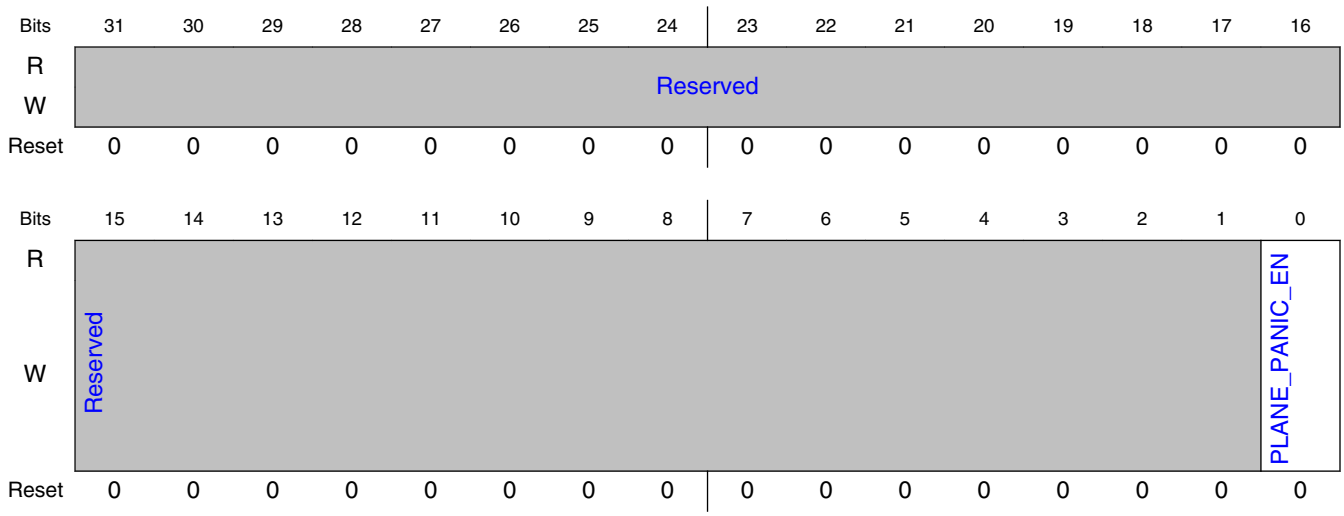
13.3.3.1.10 Interrupt Status Register for domain 0 (INT_STATUS_D1)

13.3.3.1.10.1 Offset

Register	Offset
INT_STATUS_D1	30h

13.3.3.1.10.2 Diagram

13.3.3.1.10.3 Fields



Field	Function
31-1 —	Reserved
0 PLANE_PANIC	plane panic to indicate that which FIFO reaches the panic threshold. • bit 0 -> FIFO1 panic

13.3.3.1.11 Interrupt Enable Register for domain 0 (INT_ENABLE_D1)

13.3.3.1.11.1 Offset

Register	Offset
INT_ENABLE_D1	34h

13.3.3.1.11.2 Diagram

13.3.3.1.11.3 Fields

Field	Function
31-1 —	Reserved
0 PLANE_PANIC_EN	Enable Interrupt flag to indicate that which FIFO in the pixel blending underflowed. • bit 0 -> FIFO1 panic enable

13.3.3.1.12 Control Descriptor Layer Register 1 (CTRLDESCL0_1)

13.3.3.1.12.1 Offset

Register	Offset
CTRLDESCL0_1	200h

13.3.3.1.12.2 Function

This register sets the height and width of the layer associated with the register.

13.3.3.1.12.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	HEIGHT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	WIDTH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.3.3.1.12.4 Fields

Field	Function
31-16 HEIGHT	Height of the layer in pixels.
15-0 WIDTH	Width of the layer in pixels. The layer width must be in multiples of the number of pixels that can be stored in 32 bits, and therefore differs depending on color encoding. For example, if 2 bits per pixel format is used, then the layer width must be configured in multiples of 16.

13.3.3.1.13 Control Descriptor Layer Register 3 (CTRLDESCL0_3)

13.3.3.1.13.1 Offset

Register	Offset
CTRLDESCL0_3	208h

13.3.3.1.13.2 Function

This register sets the buffer line pitch of layer data.

13.3.3.1.13.3 Diagram

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR_LOW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

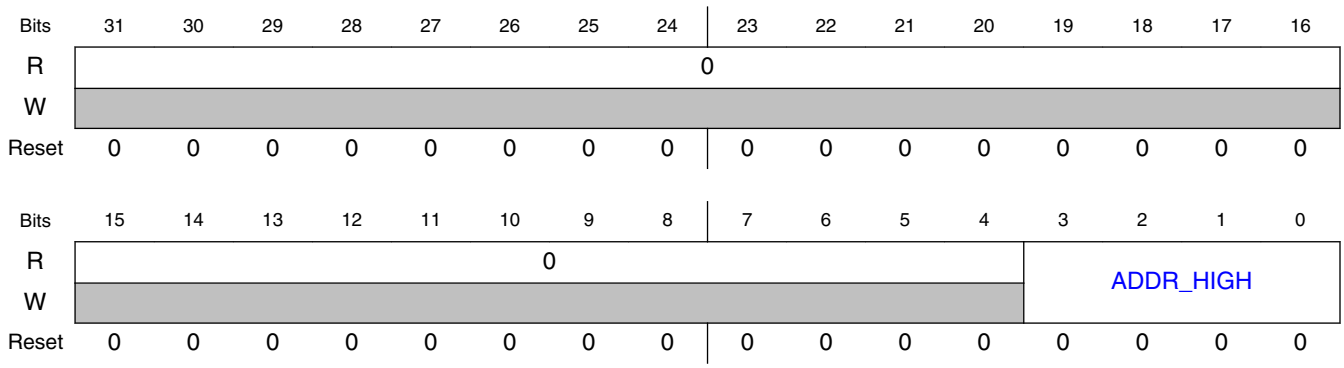
13.3.3.1.14.4 Fields

Field	Function
31-0 ADDR_LOW	Address of layer data in the memory. The address programmed should be 64-bit aligned.

13.3.3.1.15 Control Descriptor Layer Register 4 (CTRLDESCL_HIGH0_4)



13.3.3.1.15.1 Offset

Register	Offset
CTRLDESCL_HIGH0_4	210h

13.3.3.1.15.2 Function

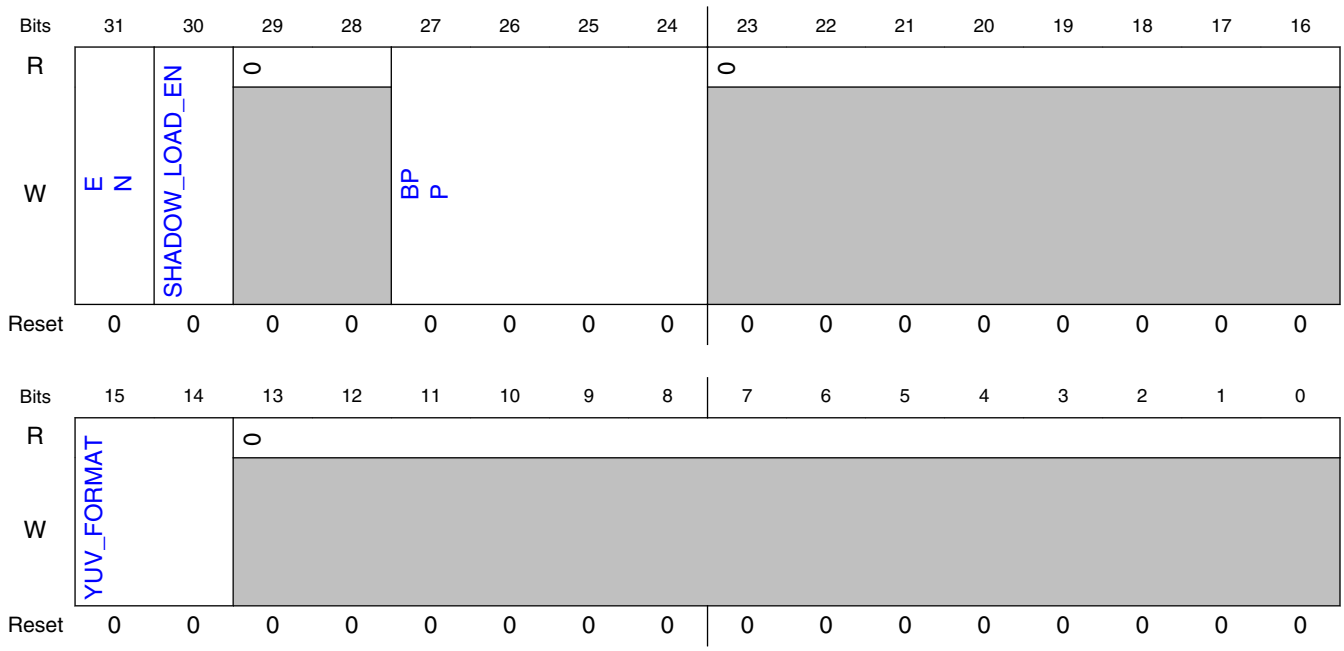
This register sets the high 4bits of the beginning address of layer data.

13.3.3.1.15.3 Diagram

13.3.3.1.15.4 Fields

Field	Function
31-4 —	Reserved
3-0 ADDR_HIGH	Address of layer data in the memory. The address programmed should be 64-bit aligned.

13.3.3.1.16 Control Descriptor Layer Register 5 (CTRLDESCL0_5)



13.3.3.1.16.1 Offset

Register	Offset
CTRLDESCL0_5	214h

13.3.3.1.16.2 Function

This register controls various graphics options and whether the layer is enabled.

13.3.3.1.16.3 Diagram

13.3.3.1.16.4 Fields

Field	Function
31 EN	Enable the layer for DMA. 0b - OFF 1b - ON
30 SHADOW_LOAD_EN	Shadow Load Enable The SHADOW_LOAD_EN bit is written to 1 by software after all DMA control registers are written. If set to 1, shadowed control registers are updated to the active control registers on VSYNC of next frame. If set to 0, shadowed control registers are not loaded into the active control registers. The previous active control register settings will be used to process the next frame. Hardware will automatically clear this bit, when the shadow registers are loaded to the active control regsisters.
29-28 —	Reserved
27-24 BPP	Layer encoding format (bit per pixel) 0100b - 16 bpp (RGB565) 0101b - 16 bpp (ARGB1555) 0110b - 16 bpp (ARGB4444) 0111b - YCbCr422 1000b - 24 bpp (RGB888) 1001b - 32 bpp (ARGB8888) 1010b - 32 bpp (ABGR8888)
23-16 —	Reserved
15-14 YUV_FORMAT	The YUV422 input format selection. 00b - The YUV422 32bit memory is {Y2,V1,Y1,U1}

Table continues on the next page...

Field	Function
	01b - The YUV422 32bit memory is {Y2,U1,Y1,V1} 10b - The YUV422 32bit memory is {V1,Y2,U1,Y1} 11b - The YUV422 32bit memory is {U1,Y2,V1,Y1}
13-0 —	Reserved

13.3.3.1.17 Color Space Conversion Ctrl Register (CSC0_CTRL)

13.3.3.1.17.1 Offset

Register	Offset
CSC0_CTRL	21Ch

13.3.3.1.17.2 Function

The CSC control register will configure the CSC module to perform color space converison between the RGB/YUV/YCbCr color spaces

// Converting from YUV/YCbCr color spaces to the RGB color space uses the

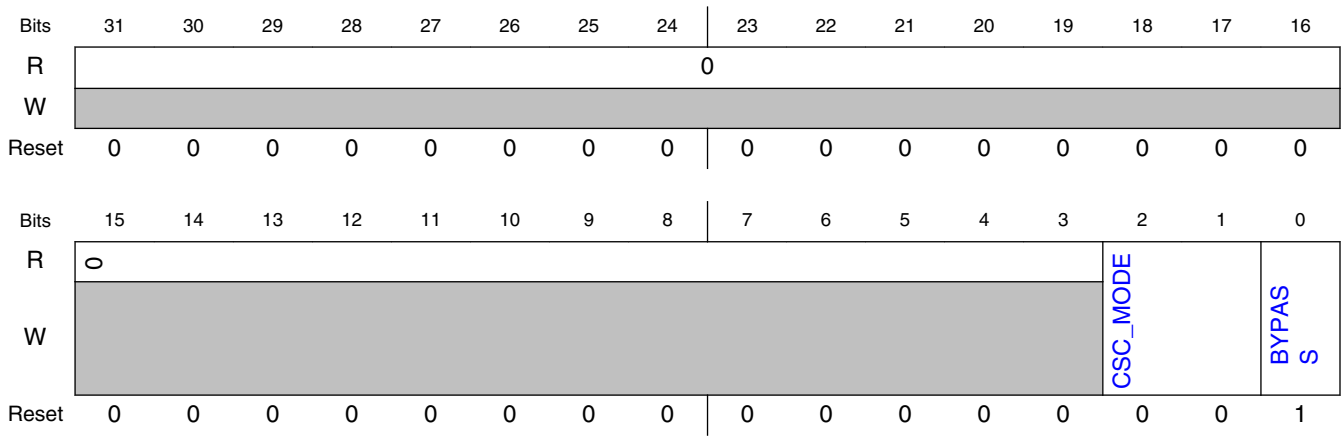
// R = A1(Y-D1) + A2(U-D2) + A3(V-D3)

// G = B1(Y-D1) + B2(U-D2) + B3(V-D3)

// B = C1(Y-D1) + C2(U-D2) + C3(V-D3)

//Converting from the RGB color space to YUV/YCbCr color spaces uses the

//following equation structure:



// Y = A1*R + A2*G + A3*B + D1

// U = B1*R + B2*G + B3*B + D2

// V = C1*R + C2*G + C3*B + D3

//All math is signed, so all coefficients come in as two's comp numbers

13.3.3.1.17.3 Diagram

13.3.3.1.17.4 Fields

Field	Function
31-3 —	Reserved
2-1 CSC_MODE	This field controls how the CSC unit operates on pixels when the CSC is not bypassed. 0x0 YUV2RGB-- Convert from YUV to RGB. 0x1 YCbCr2RGB-- Convert from YCbCr to RGB. 0x2 RGB2YUV -- Convert from RGB to YUV. 0x3 RGB2YCbCr -- Convert from RGB to YCbCr.
0 BYPASS	This bit controls whether the pixels entering the CSC2 unit get converted or not. When BYPASS is set, no operations occur on the pixels. When BYPASS is cleared, the selected CSC operation takes place.

13.3.3.1.18 Color Space Conversion Coefficient Register 0 (CSC0_COEF0)

13.3.3.1.18.1 Offset

Register	Offset
CSC0_COEF0	220h

13.3.3.1.18.2 Function

This register contains color space conversion coefficients in two's complement notation.

24-16 PANIC_THRES_LOW	This value should be set to a value of pixels, from (0+1)*128bits to (511+1)*128bits. When the number of pixels in the input pixel FIFO is less than this value, the panic control output will be raised.This signal can be used to raise the access LCDIF's access priority. • 0: threshold is 1*128bits • 1: threshold is 2*128bits • . • . • . • 511:threshold is 512*128bits
15-9 —	Reserved
8-0 PANIC_THRES_HIGH	This value should be set to a value of pixels, from (0+1)*128bits to (511+1)*128bits. When the number of pixels in the input pixel FIFO is more than this value, the panic control output will be removed.This signal can be used to raise the access LCDIF's access priority. • 0: threshold is 1*128bits • 1: threshold is 2*128bits • . • . • . • 511:threshold is 512*128bits

13.4 Image Sensing Interface (ISI)

13.4.1 Overview

Image Sensor Interface (ISI) module interfaces up to 2 pixel link sources to obtain the image data for processing in its pipeline channels. Each pipeline processes the image line from a configured source and performs one or more functions that are configured by software, such as down scaling, color space conversion, de-interlacing, alpha insertion, cropping and rotation (horizontal and vertical). The processed image is stored into programmable memory locations.

This module can process up to 2 image sources at the same time and can concatenate the internal line buffers such that higher resolution images can be processed at the expense of keeping some channels unused. This module implements limited flow control mechanism to control output from its internal buffer flushing or sourcing an image from memory. Depending on the format type, this module is capable of processing and storing one line of pixels from the incoming frame.

13.4.1.1 Block diagram

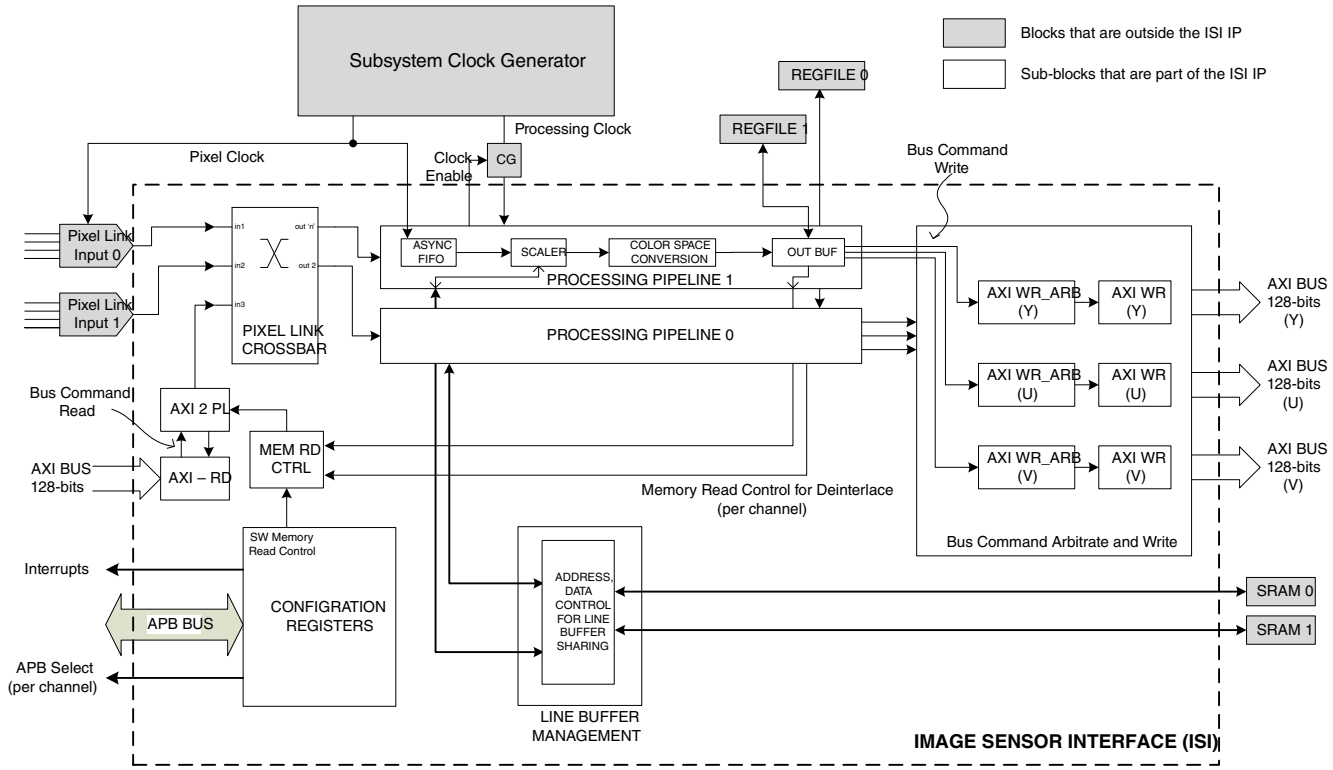

Figure 13-8. ISI block diagram

13.4.1.2 Features

The ISI includes the following features:

- Supports one source of 4K resolution at 30 fps (24bpp).
- Supports up to 2K resolution at 30 or 60 fps (24bpp) on each channel.
- Input sources supported:
  - 2 pixel link interfaces running in parallel that can interface to 2 camera sensors.
  - System Memory (AXI master; internally converted to Pixel Link Interface).
- Each processing pipeline or channel can be assigned to the same or different pixel input source.
- Stream Multiplexing
  - Duplicates input stream into multiple outputs.
  - Simple De-Interlacing methods supported for interlaced input sources:
    - Weaving
    - Line Doubling
    - Linear Interpolation or Averaging
  - One input source can be processed in more than one processing channels.
- Stream Manipulation Features
  - Supported Pixel Formats when storing image into memory
    - RAW8, RAW10, RAW12, RAW16

        - RGB888, BGR888, RGB565, RGB 10-bit, BGR 10-bit
        - YUV444, YUV422, YUV420 (8-bit, 10-bit, 12-bit) in planar or semi-planar formats
        - Plus more formats listed in the description of FORMAT field in the channel's IMG_CTRL register
    - Downscaling of input image via Decimation and Bilinear filtering
        - Decimation by 2, 4, or 8 supported
        - Bilinear filter further downscales by 1.0 to 2.0 (fractional downscaling)
    - Color Space Conversion (CSC)
        - RGB, YUV, YCbCr
        - User defined color space matrix based conversion
    - Alpha channel insertion for RGB formats
        - Global alpha value.
        - Separate rectangular region of interest (ROI) alpha value. ROI alpha values have higher priority than global alpha value.
            - Up to 4 ROI non-overlapping rectangles supported
    - Mirroring (Image Flip): Horizontal and Vertical flips supported.
    - Frame Awareness, Frame Skipping
        - Clean frame start, shutdown based on HSYNC and VSYNC.
        - Buffer overrun protection.
        - Buffer under run deterministic behavior.
- Stream Output Options
    - Output to Memory
        - Input source will be converted to and processed by the processing pipeline as YUV444 or RGB.
        - Processed images will be output from pipeline and stored into memory location specified by software.
        - Full line storage available at processing channel output before outputting data to AXI. This storage can automatically split or combine depending on the output format being used.
        - Dual buffered addresses used in ping pong fashion with active buffer status indication.
        - Line and Frame stored interrupt status to software to track progress of frame.
- Flow Control
    - Panic indication to software and device to increase priority of its write transactions to avoid potential overflow in output buffers. Software can configure thresholds for panic indication.

- When pixels are sourced from memory or input line buffers are flushed, software has the option to program the rate at which pixels will be sent out. By default, one pixel per clock is sent out.
- Back pressure mechanism to stall the channel pipeline during line buffer flushing and sourcing image from memory, when AXI bus is unable accept data and the output buffers are low on storage.

13.4.2 Design Overview

The design architecture and data flow can be understood by going one block at a time.

Pixel Link Crossbar: The ISI module comprises of 2 parallel processing pipelines which can be assigned to any of the input image source via the Pixel Link Crossbar. The crossbar is a 3 input, 2 output multiplexer where each output port can be configured to connect to any of the 3 inputs. The 3 inputs are numbered from 0 to 2; of which input 3 is always a memory location. One input can be assigned to multiple outputs on the crossbar. There is no latency in the crossbar. The image input to the module is through the Pixel Line Slave port which provides the clock, data & control buses and HSYNC and VSYNC signals. The crossbar connects these slave port signals to any of the 2 processing channels which pull the pixel data out from the asynchronous FIFO in the Pixel Line Slave port. The only exception is when the image is read from memory. In this case, the ISI module will convert the lines read from memory into Pixel Link Slave interface signals so that the signals seen at the crossbar and processing channels are same as other sources.

Processing Pipeline: Each processing channel comprises of a Down Scaling Engine, Color Space Conversion (CSC) block and Output Buffer Control block. The scaler performs decimation and bilinear filtering of the input image. The output buffer control perform various functions like alpha insertion, cropping, horizontal or vertical flipping and generating AXI Write transactions for storing the processed image into the memory. It supports storing the image as 1/2/3 planar at different memory locations. Each processing channel has one line buffer associated with it. Each line buffer can store up to 2048 pixels with 8-bits per color component. For processing higher resolution images (like 4K), line buffer from other channels can be combined to provide more storage. However, in this case, the channels from which line buffers are borrowed will remain disabled and cannot function. There is a restriction on software that buffers from adjacent channels can only be concatenated. This means channel 1 line buffer can be connected to channel 2 line buffer and no other channel. Additionally, when performing scaling on YUV420 input data, an additional line buffer is needed which can be configured independently of line buffer concatenation. Software must ensure correct channel's line buffers are used.

Line Buffer Management: Processing channels are capable of handling up to 4K image resolution. However, the line buffer storage in one channel is enough for 2K image resolution. In order to be able to process and store a 4K image, line buffer from adjacent channel needs to be chained with the current channel's line buffer. The very last channel's line buffer cannot be concatenated with other channels, hence 4K resolution cannot be supported on that channel. The line buffer management block handles the muxing and concatenation of line buffers across channels. Software will configure chaining of line buffers and how many buffers to use in parallel. Thus, for example, if channel 2 is processing a 4K image then the address bus of this channel will be able to access line buffers from channels 2 and 3. Channel 1 will be able to address line buffer 1 only since it can process a lower resolution image only. When line buffers get chained, the output buffers or ping pong buffers also get chained automatically.

NOTE

For Line Buffer Management, each channel has a corresponding clock which is used. The CHNLn_CTRL[CLK_EN] bit must also be set for each channel in order to enable chain buffering.

This sub-block also handles sharing of line buffer as second line buffer for a primary channel that is performing YUV420 scaling, which requires two line buffers. The software configures the channel number whose line buffer acts as the second line buffer for the primary channel performing the scaling. This block routes the read/write data between the primary or second line buffers as addressed by the primary channel. Note that output buffers are not shared between primary and secondary channels and hence the secondary channel can be used in bypass mode to process images as required by software or can remain disabled.

Output Buffer Control and AXI Output: The output buffer control block of each processing channel will perform image cropping, flipping (horizontal and vertical) and alpha value insertion, in addition to collecting the processed image pixels in a ping pong buffer and send out bursts of 128 bytes or 256 bytes (configurable) of data over the AXI interface to memory. This block also performs the function of de-interlacing the frames while storing them into memory. The final processed image pixels can be formatted to be stored in any of the multiple image formats mentioned in the description of the FORMAT field of the IMG_CTRL register. The output buffer control also manages the concatenation of ping pong buffers per component based on output image format. The combined storage of the 3 ping pong buffers is up to a full line of the image frame depending on the output image format. Flow control and panic mechanisms are implemented to ensure the data is sent out at a rate acceptable to the system and output buffers do not overlow.

AXI Memory Read: The ISI module is capable of reading an image from memory in different formats as mentioned in the MEM_RD_CTRL register. The module reads the image via AXI read and internally drives the image through a pixel to the processing channel. This operation is also flow controlled and software can configure the rate at which pixels are processed in the channel and sent out. By default, one pixel per clock is processed when the read FIFO is not empty.

Configuration Registers: Each channel has the same set of configuration registers which are aligned to a 4 KB boundary and will be programmable via APB interface. The module does not check for correctness of values being programmed. It is up to the software to ensure this.

13.4.3 Functional description

The following sections describe functional details of the ISI module.

13.4.3.1 Initialization and Channel Configuration

This section describes the suggested steps to configure the individual channels in ISI and handle interrupts for proper and efficient image processing. Every channel that needs to be configured must follow these suggested initialization steps for correct operation of the module.

First the general channel configuration is done as follows:

- Set the CNHL_CTRL[CLK_EN] bit to 1 to enable the clock to the channel. This is required to access other registers in the channel and also for image processing by channel.
- If the channel is supposed to be bypassed i.e. No Scaling and No Color Conversion is needed; set the CHNL_CTRL[CHNL_BYPASS] bit to 1, else set to 0. This will cause the image coming into the channel to be directly stored into memory without any kind of processing. However, image flipping (horizontal and/or vertical), image cropping, alpha insertion (RGB format only) and format conversion (YUV444 to YUV422 or YUV420) can still be done while bypass is enabled.
- Select the source of input image. The input can be any of the 2 Pixel Links (0 to 1). An additional pixel link, (Pixel Link 2), can be selected as a source. Pixel Link 2 will always read an image from a programmed location in memory. Configure the source in CHNL_CTRL[SRC] field.

NOTE

- Please refer to SOC Configuration for actual source types connected to Pixel Links 0 to 1.

- Select the type of source for the channel between non-memory Pixel Links (image sourced from camera sensor, SRC_TYPE = 0) and Memory Pixel Link (image sourced from memory, SRC_TYPE = 1). A memory Pixel Link refers to a Pixel Link 2 which sources the image from a programmed memory location only. This is useful for de-interlacing and processing image directly from memory. For channels that do not support sourcing image from memory, the source type is always a Non-memory Pixel Link. Configure the source type for channel in CHNL_CTRL[SRC_TYPE] field.
- Configure the image width and height in channel's CHNL_IMG_CFG register. For example, a 1920x1080 image will have CHNL_IMG_CFG[WIDTH] = 0x780 and CHNL_IMG_CFG[HEIGHT] = 0x438.
- Configure the memory address where the processed or bypassed data from the channel has to be stored. The image can be stored as 1-planar (all color components stored together), 2-planar (Y component stored in one memory address and UV stored into a different memory address), and 3-planar (each component stored in different memory address). For 1-planar addressing, configure the 32-bit address in CHNL_OUT_BUF1_ADDR_Y and CHNL_OUT_BUF2_ADDR_Y registers. For 2-planar and 3-planar addressing, the CHNL_OUT_BUF1_ADDR_U and CHNL_OUT_BUF2_ADDR_U are additionally used. For 3-planar addressing, the CHNL_OUT_BUF1_ADDR_V and CHNL_OUT_BUF2_ADDR_V are additionally used. Refer to section on Output Buffer Addressing for more details on how the two buffer addresses are used.

NOTE

RGB and RAW images are always stored as 1-planar while other YUV formats can be stored as 1/2/3-planar.

- Configure the output buffer line pitch in the CHNL_OUT_BUF_PITCH[LINE_PITCH] register. The line pitch is the number of bytes between the start location of two lines. It is mainly used to have line addresses start at an aligned boundary.

NOTE

- The line pitch is same for all image components irrespective of they being stored in 1-planar, 2-planar, or 3-planar. In 2 and 3-planar output, the U and V component will have the same line pitch as the Y component.
- Ensure that line pitch is programmed to be greater than number of bytes in one line.

- Toggle the address load bits i.e. CHNL_OUT_BUF_CTRL[LOAD_BUF1_ADDR] and CHNL_OUT_BUF_CTRL[LOAD_BUF2_ADDR] to allow new configured addresses to be picked and used in the channel, when it is enabled later.

Follow the steps detailed in appropriate sections based on which functionality is to be used for the application.

- Refer to the Scaling Operation section for details about scaler and configuring the scaler for use.
- Refer to the Color Space Conversion (CSC) section for details about CSC and configuring the block for use.
- Refer to the Image De-interlacing section for details about different de-interlacing methods and configuration for enabling each de-interlacing method for the channels.
- Refer to the High-Res Image Handling section for enabling controls to allow higher than 2K image resolution to be handled by the channel.
- Refer to the Sourcing Image from Memory section for details on how to configure channel 0 to read and process an image that is sourced from memory.
- Refer to the Output Buffer Management section for details on how to configure controls for image cropping, flipping, alpha insertion, handle buffer overflows and request higher AXI channel priority for emptying the buffers.
- Refer to the Flow Control section for details on how to configure the rate of pixel outout from this module on to the AXI bus.

Once the above steps are completed, the channel can now be enabled and monitored using the following steps:

- Enable the necessary interrupt by writing '1' to appropriate interrupt enable bits in the CHNL_IER register.
- Enable the channel by writing '1' to the CHNL_CTRL[CHNL_EN] bit. This is enable to channel to start accepting images from the selected source.

- Monitor the status of channel through the CHNL_STS register. Each bit provides a status or error indication for the software to take appropriate action. Interrupt status bits can be cleared by writing 1 to respective bits.
- When required, the complete channel can be reset to its default reset state by writing '1' to the CHNL_CTRL[SW_RST] bit. Software must keep this bit '1' for at least 5 to 6 NOP cycles to allow reset to propagate and then set this bit to '0' to complete the reset cycle. After the software reset, the channel will return to the same default state as it would have been after a hardware reset. No configuration register is reset during the software reset. Software may additionally clear the CHNL_CTRL[CHNL_EN] bit while software reset is asserted to control the restarting of channel after software reset completes.

When configuring multiple channels, the above suggested steps must be carried out for all channels.

13.4.3.2 Scaling Operation

The scaling engine works in two parts. It performs pre-decimation of the image followed by bilinear filtering to achieve the desired down scaling factor.

The decimation filter provide a maximum down scaling factor of 8, and the subsequent bilinear filter provides a maximum down scaling factor of 2. Combined, the maximum scaling factor can be up to 16. The decimation and bilinear scaling engines are independently programmable. There is also an initial offset that is programmable to allow more source data to be considered in the bilinear scaling engine. The scaled output image is presented to the CSC module as YUV444 or RGB888 pixels with a single byte for each color channel.

13.4.3.2.1 Configuring the scaler

Channel initialization is a prerequisite to configuring the scaler. Steps to configure scaler are as follows:

- Configure the scale offset values for X and Y dimensions in CHNL_SCALE_OFSET register. This is the initial offset from (0,0) coordinate, where the first output scaled pixel will be computed.
- Configure the scale factor values for X and Y dimensions in CHNL_SCALE_FACTOR register. This is step factor through which the image will be sampled for down scaling.
- Configure the decimation factor values for X and Y dimensions in CHNL_IMG_CTRL[DEC_X] and CHNL_IMG_CTRL[DEC_Y] fields. The final scaling factor that will be used by scaler is: = (Decimation Factor) x (Scale Factor)

- Set the CHNL_IMG_CTRL[YCBCR_MODE] bit to 1 if the incoming image or the converted image is in $YC_b C_r$ format.
- Set the CHNL_SCL_IMG_CFG register to the dimension of image after scaling. This register must be configured whenever scaler is enabled, even with 1:1 scaling.
- **Special Consideration for YUV420 image input:** When a channel has to handle YUV420 image type at the scaler input, it must follow these additional steps:
  - If scaler is bypassed, no additional action is needed. The scaler will convert the input YUV420 image to YUV444 for processing in the channel.
  - If scaler is enabled, an additional line buffer is needed by the channel to perform scaling correctly. Set the CHNL_CTRL[SEC_LB_SRC] to the channel number whose line buffer is to be used. The channel whose line buffer is being shared cannot be used and will remain disabled.
  - For higher than 2K resolution, it is important to set the CHNL_CTRL[CHAIN_BUF] in both channels i.e. channel performing the scaling and the channel whose line buffer is being shared.

NOTE

For both types of YUV420 data format with scaler enabled, it must be ensured that the minimum VSYNC width should be 2 lines. Additionally for YUV420 Type 2 format, the minimum HYSNC front porch width should be 1 clock. For all other cases, the minimum VSYNC width should be 1 line and minimum HSYNC porch (front and back) width should be 0 clock.

- Return to initialization steps to complete the initialization of other blocks and enabling the channel.

Example: If the image needs to be down scaled by a factor of 4.5 in the X and Y dimension, then the software can program the scaler as:

- CHNL_IMG_CTRL[DEC_X] and CHNL_IMG_CTRL[DEC_Y] = 10 or decimate by 4
- CHNL_SCALE_FACTOR[X_SCALE] and CHNL_SCALE_FACTOR[Y_SCALE] = 0x2200 indicating a scaling factor of 1.125
- This will give the overall down scaling by 4 x 1.125 = 4.5

13.4.3.3 Color Space Conversion (CSC)

The Color Space Conversion or CSC is a full duplex color space converter that can convert into either RGB or YUV (or YC_bC_r) color spaces depending on the desired output pixel format. All coefficients are programmed as two's compliment numbers. The

CSC unit can be individually bypassed on a channel if it is not desired in the application. The output of the CSC is sent to the output buffer control block for further processing and storing into memory.

The following equations indicate the CSC module's ALU architecture.

(a) RGB to YUV (or YC_bC_r) conversion

- Y = (A1 x R) + (A2 x G) + (A3 x B) + D1
- U = (B1 x R) + (B2 x G) + (B3 x B) + D2
- V = (C1 x R) + (C2 x G) + (C3 x B) + D3

(b) YUV (or YC_bC_r) to RGB conversion

- R = (A1 x (Y - D1)) + (A2 x (U - D2)) + (A3 x (V - D3))
- G = (B1 x (Y - D1)) + (B2 x (U - D2)) + (B3 x (V - D3))
- B = (C1 x (Y - D1)) + (C2 x (U - D2)) + (C3 x (V - D3))

where A1 to A3, B1 to B3, C1 to C3 and D1 to D3 are the programmable coefficients and YUV and RGB refer to the pixel values.

Saturation of each color channel is checked and corrected for excursions outside the nominal color space. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

13.4.3.3.1 Configuring the CSC

Channel initialization is a prerequisite to configuring the CSC. Steps to configure CSC are as follows:

- If CSC is not required to be run and the channel is not bypassed, then CSC block can be bypassed by setting the CHNL_IMG_CTRL[CSC_BYP].
- If CSC is required then configure the coefficients in the CHNL_CSC_COEFF0 to CHNL_CSC_COEFF5 registers.
- Set the CHNL_IMG_CTRL[YCBCR_MODE] bit to 1 if the incoming image or the image after color space conversion is in $YC_b C_r$ mode.
- Set the CHNL_IMG_CTRL[CSC_MODE] field to configure the required conversion method.
- Return to initialization steps to complete the initialization of other blocks and enabling the channel.

13.4.3.4 Image De-interlacing

ISI supports image de-interlacing for images that are interlaced across frames. One of the following de-interlace methods can be used to form the de-interlaced image.

- ***Weaving -*** Weaving is done by combining consecutive fields together to form the new frame. Weaving will result in artifacts known as "combing," when the pixels in one frame do not line up with the pixels in the other, forming a jagged edge.
  - To perform weaving in an ISI channel, one field's lines are stored in memory with double line pitch; thereby leaving one line space in memory for the second field's lines to be stored. The two interlaced frames get woven while being stored to memory. Software has the choice to have odd frame on top or even frame on top.

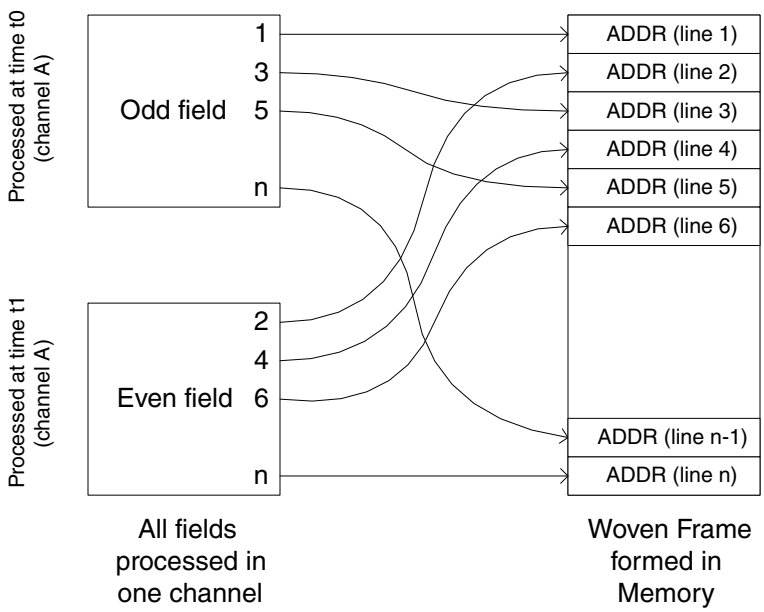

Figure 13-9. Weave De-interlacing

- ***Line Doubling -***Line doubling takes the lines of each interlaced field (consisting of only even or odd lines) and doubles them, filling the entire frame. This results in the video having a frame rate identical to the field rate, but each frame having half the vertical resolution, or resolution equal to that of each field that the frame was made from. Line doubling prevents combing artifacts but causes a noticeable reduction in picture quality since each frame displayed is doubled and really only at the original half field resolution.
  - To perform line doubling in an ISI channel, two channels are enabled and configured the same way except for the output memory address. One channel will store the image at location ADDR, while the other channel will store the

image at location ADDR + Line Pitch. Both channels will process the same image lines and store them at a line pitch distance in memory thereby causing the line to be doubled.

- Any two channels can be used to perform line doubling.

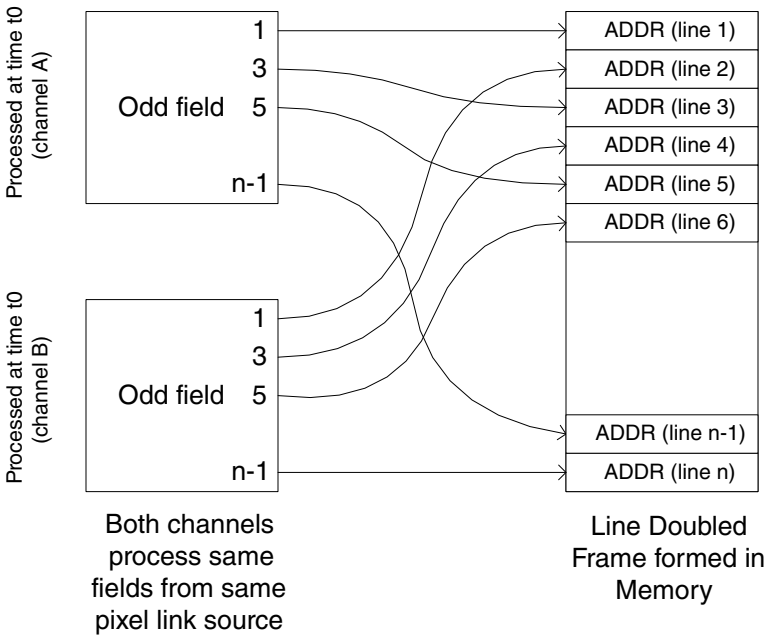

Figure 13-10. Line Doubling De-interlace

- ***Blending (linear interpolation)* -** is done by averaging consecutive fields to be displayed as one frame. Combing is avoided because the images are on top of each other. This instead leaves an artifact known as ghosting.
  - To perform blending in an ISI channel, two channels are required because blending is carried out in two steps:
    1. Perform weaving of the two fields and store them to an intermediate (or temporary) location.
    2. Read back from temporary location using another channel, perform averaging using the scaler and store the final frame into the desired memory location.

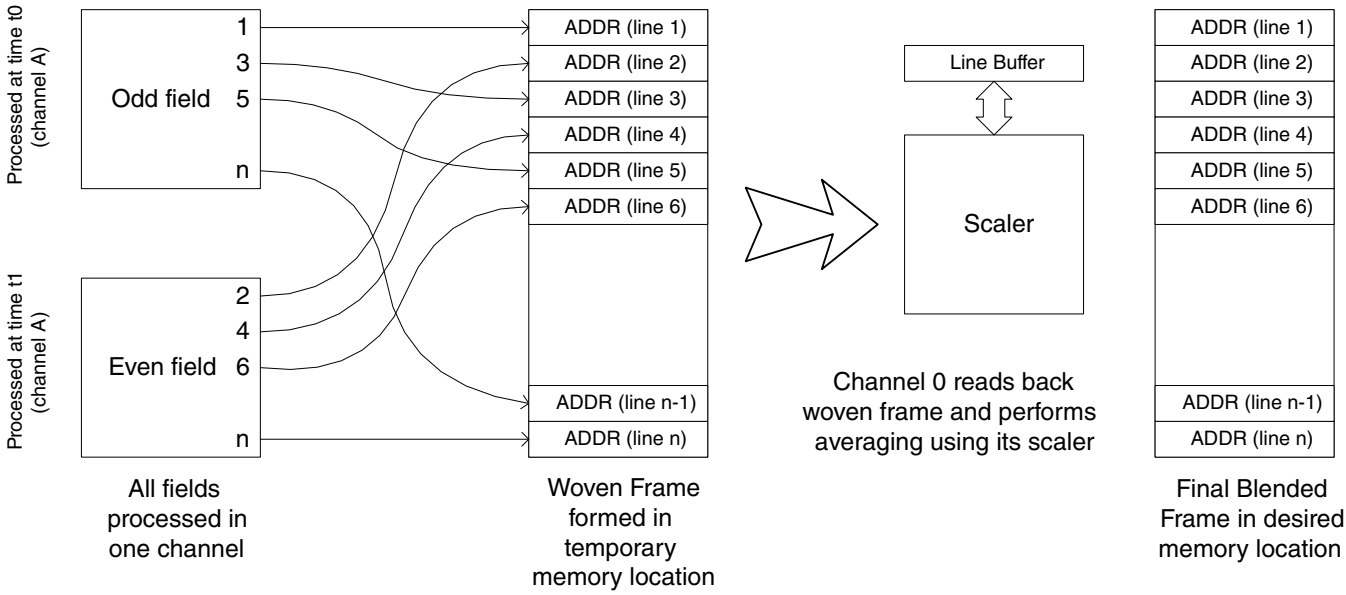

Figure 13-11. Blend De-interlace

13.4.3.4.1 Configuring de-interlacing

Channel initialization is a prerequisite to configuring the de-interlace block. Steps to configure the de-interlace block are as follows:

- ***Weaving -*** Configure the weaving de-interlace method by writing "010" or "011" to the CHNL_IMG_CTRL[DEINT] field to enable weave de-interlace with Odd frame first or Even frame first, respectively.
- ***Line Doubling -*** Two channels need to be configured to perform line double de-interlacing. Configure line doubling de-interlace method by writing "11x" to the CHNL_IMG[DEINT] field to enable line doubling in each field to form a complete de-interlaced frame. Both channels should be configured with the same configuration except for the final output memory address which should differ by one line pitch between the channels. If the address in one channel is configured as "A", then the other channel should have the address configured as "A + line_pitch". The line pitch is configured in the CHNL_OUT_BUF_PITCH[LINE_PITCH] field.
- ***Blending (linear interpolation) -*** Two channels need to be configured when performing blend de-interlacing. One channel performs weaving and the other channel (now referred to as read channel) performs the averaging. Configure blend de-interlace method by writing "100" or "101" to the CHNL_IMG_CTRL[DEINT] field of that channel's register that performs the weaving operation (this is also the channel that aources the image from the interlaced camera sensor). The read channel which performs the averaging should have this field set to "00x", i.e. no de-interlacing (this channel sources the image from memory).
    - Configure the temporary memory location as output address, line pitch and frame pitch in CHNL_IN_BUF_ADDR[ADDR], CHNL_IN_BUF_PITCH[FRM_PITCH] and

CHNL_IN_BUF_PITCH[LINE_PITCH] respectively, for the channel performing the weave operation. Software must allocate enough memory to store two frames with a frame pitch before the previous frames get overwritten. CHNL_OUT_BUF_PITCH, CHNL_OUT_BUF1_ADDR_U/V and CHNL_OUT_BUF2_ADDR_Y/U/V are not used.

- Set the output format in CHNL_IMG_CTRL[FORMAT] field of the channel performing the weave operation to one of the formats mentioned in CHNL_MEM_RD_CTRL[IMG_TYPE] field. This will ensure that output of weave channel is same as that can be read by the read channel.
- Configure the read channel CHNL_IN_BUF_ADDR[ADDR] and CHNL_IN_BUF_PITCH to point to the temporary memory location and pitch values (which are CHNL_OUT_BUF1_ADDR_Y[ADDR], CHNL_IN_BUF_PITCH of the weave channel).
- Configure the read channel CHNL_SCALE_OFFSET[Y_OFFSET] to 0.5 to perform averaging of the lines.
- Configure the read channel CHNL_OUT_BUF1_ADDR_*[ADDR], CHNL_OUT_BUF2_ADDR_*[ADDR] and CHNL_OUT_BUF_PITCH[LINE_PITCH] registers to configure the final output memory location of the blended frame.
- Configure the read channel CHNL_MEM_RD_CTRL[IMG_TYPE] same as the channel output format of the channel performing the weaving operation. There is no need to configure the CHNL_MEM_RD_CTRL[READ_MEM] bit in channel 0 for blend de-interlacing since the weaving channel automatically initiates the reads from the read channel.

- Return to initialization steps to complete the initialization of other blocks and enabling the channel.

NOTE

For all channels which have the CHNL_IMG_CTRL[DEINT] set to values other than "00x; the scaler & CSC will be automatically bypassed. However, the read channel scaler and CSC will work for blend de-interlacing since we do not set the CHNL_IMG_CTRL[DEINT] field for the read channel.

NOTE

Other image operations (alpha insertion, cropping, horizontal and vertical flipping) can still be carried out along with de-interlacing with the only exception that these operations *should not* be done in the weaving channel during blending de-interlace. They can be carried out on the final blended image frame in the read channel.

13.4.3.5 High-Res Image Handling

Each channel in ISI is capable of handling up to 4K image resolution. However, the line buffer and output buffer storage in one channel is enough for 2K image resolution. In order to be able to process and store a 4K image, line buffer and output buffers from adjacent channel need to be chained with the current channel's line buffer and output buffers respectively. Chaining of line buffers and output buffers has a limitation that only the subsquent channels can be chained. For example, if channel 1 has to handle a 4K image, its line buffer and output buffers can be chained to line buffer and output buffers from channel 2, respectively and no other channel. In generic terms, line buffer and output buffers of channel 'n' can be chained with line buffer and output buffers, respectively, of channel 'n+1' only.

NOTE

If a channel's line buffer and output buffers are chained with another channel, then that channel should be kept disabled and cannot be used for any image processing.

Channel initialization is a prerequisite to configuring chain control in the channel. Steps to configure chaining of line buffers are as follows:

- Configure the channel's CHNL_CTRL[CHAIN_BUF] field to "01" to support a line resolution up to 4096 or 4K pixels.
- Ensure that the CHNL_CTRL[CHNL_EN] = 0 for the channel whose line buffer has been chained with a previous channel's line buffer.
- Return to initialization steps to complete the initialization of other blocks and enabling the channel.

13.4.3.6 Output Buffer Management

The output buffer block in ISI provides some further image processing options, like:

- ***Alpha Insertion in RGB fomrats***
  - ISI supports global alpha value insertion to RGB images in which one alpha value is inserted to all pixels in the image.
  - ISI supports up to 4 non-overlapping regions of interests or ROIs in which different alpha values can be inserted.
  - If both ROI Alpha and Global Alpha values are enabled, then ROI Alpha values takes priority over Global Alpha value.

  - Pixels that do not lie in any of the ROI can have a global alpha value (if enabled) or not have any alpha value inserted (if global alpha insertion is disabled).
  - The Upper Left Coordinate (ULC) and the Lower Right Coordinate (LRC) can be configured individually for each ROI. The ULC and LRC should lie within the dimensions specified by the scaled image configuration register (CHNL_SCL_IMG_CFG).
- ***Image Flipping***
  - ISI supports horizontal and vertical image flipping.
  - Either one or both flipping can be enabled.
- ***Image Cropping***
  - ISI support cropping in both X and Y dimensions based on the programmed ULC and LRC. The ULC and LRC should lie within the dimensions specified by the scaled image configuration register (CHNL_SCL_IMG_CFG).

NOTE

The order in which the above operations are carried out are: Alpha Insertion, Cropping and Flipping.

The above image manipulation operations are carried out before the image is stored into the output buffers. The image input to the output buffer block (from scaler/CSC) is in either RGB or YUV444. The output buffer logic then formats each pixel from these two formats to the desired output format as specified in the CHNL_IMG_CTRL[FORMAT] field. The output buffers consolidate the formatted image pixel bytes and send out 128-bytes or 256-bytes AXI Write Bursts to store the image into memory. ISI has in-built pre-overflow warning mechanism through which it can warn the subsystem and request higher AXI write channel priority to avoid any overflows in its buffers. In any case, if an overflow does occur, ISI will stop storing pixels for that line and starts storing pixels from the next line. This will cause the frame to be corrupted and software should take appropriate action for such frames. For images sourced from memory, ISI can stall its internal pipeline or control the rate at which pixels are processed in the pipeline. More details in Flow Control section.

There are two destination addresses (CHNL_OUT_BUF1_ADDR_* and CHNL_OUT_BUF2_ADDR_*) that need to be programmed. The BUF1 address is used when the channel is enabled for the first time. This address is internally incremented by a line pitch (CHNL_OUT_BUF_PITCH) at end of each line, except last line, to compute the address for each line storage. ISI generates a line_stored interrupt when a full line is completely stored and a frame_stored after the last line is completely stored in memory. The next frame is stored at BUF2 address in the same way. Software may update CHNL_OUT_BUF1_ADDR_* at this point, if desired. On every frame_stored interrupt, the ISI toggles between the two buffer addresses. Status bits provide indication to

software on which buffer is currently active. Software can update the buffer address regiters at any time but they will take effect only on when corresponding load address bits are toggled. The new address gets loaded when the current frame completes.

The ISI automatically manages the output buffer size depending on the output image format. For 2 and 3-planar formats, the output buffer is divided accordingly to each component based on amount of bytes used by the component. For 1-planar, RGB and RAW, the output buffer function as a unified buffer. This allows efficient utilization of output buffers even when they are concatenated.

13.4.3.6.1 Configuring additional image processing options

Please follow the channel initialization steps prior to configuring the additional image processing controls. To configure the image processing options:

- ***Alpha Insertion***
  - Configure CHNL_IMG_CTRL[GBL_ALPHA_VAL] to set the global alpha value and set CHNL_IMG_CTRL[GBL_ALPHA_EN] = '1' if a global alpha value is to be inserted in the image. This should be set when both global and regional alpha values are to be inserted.
  - Configure CHNL_ROI_n_ALPHA[ALPHA] and CHNL_ROI_n_ALPHA[ALPHA_EN] = 1 (where 'n' = 0, 1, 2, or 3) to have region specific alpha values.
  - Configure the region of interest coordinates in CHNL_ROI_n_ULC and CHNL_ROI_n_LRC registers, where 'n' = 0, 1, 2, 3. Regions should not overlap nor should they lie outside the scaled image dimensions.
- ***Image Flipping***
  - Configure horizontal flipping of output image by setting CHNL_IMG_CTRL[HFLIP_EN] = 1.
  - Configure vertical flipping of output image by setting CHNL_IMG_CTRL[VFLIP_EN] = 1.
- ***Image Cropping***
  - Configure the cropped region of image in CHNL_CROP_ULC and CHNL_CROP_LRC registers. This is region that will be stored to memory.
  - Enable cropping by setting CHNL_IMG_CTRL[CROP_EN] = 1.

NOTE

The ULC and LRC (both for alpha insertion and cropping) should be configured based on the image resolution output from scaler and not the original image resolution. The output buffer block works on the output from CSC (when no bypass) or Scaler (if CSC is bypassed). Only during a channel bypass or 1:1 scaling should the original resolution be used for determining the ULC and LRC.

13.4.3.6.2 Configuring output buffer controls

Please follow the channel initialization steps prior to configuring the output buffer controls. To configure the output buffer controls:

- Output Memory Addressing
  - Configure the destination memory address in the CHNL_OUT_BUF1_ADDR_n and CHNL_OUT_BUF2_ADDR_n (where n = Y, U, V).
  - Configure the output image line pitch in CHNL_OUT_BUF_PITCH[LINE_PITCH]. The line pitch is the spacing between two lines in terms of number of bytes.
  - Toggle the address load bits i.e. CHNL_OUT_BUF_CTRL[LOAD_BUF1_ADDR] and CHNL_OUT_BUF_CTRL[LOAD_BUF2_ADDR] to allow new configured addresses to be picked and used in the channel.
  - On every CHNL_STS[FRM_STRD] interrupt assertion, software must update the appropriate buffer 1 or buffer 2 address. If this is not done, the same address will be used and frame will be overwritten.
  - On every update to the CHNL_OUT_BUF1_ADDR_n or CHNL_OUT_BUF2_ADDR_n registers, the appropriate address load bits should be set to '1'. Without setting the load bit, the new address will not be picked.
  - The active buffer to which the current frame is being stored to is indicated via status bits - CHNL_STS[BUF1_ACTIVE], CHNL_STS[BUF2_ACTIVE].

NOTE

When performing de-interlace, the output memory addressing changes for that channel. Please refer to Image De-interlacing section for configuring the destination memory addresses for that channel.

NOTE

Ensure that line pitch is programmed to be greater than number of bytes in one line.

- Return to initialization steps to complete the initialization of other blocks and enabling the channel.

13.4.3.7 Sourcing Image from Memory

A channel can be configured to read image from memory in two cases:

- During Blending De-interlace, hardware controlled memory reads occur. Refer to Image Deinterlacing section for more details.
- Software controlled memory read.

This section details the configuration required for software controlled memory reads. Please follow the channel initialization steps prior to configuring the memory image read on a channel. The steps to configure channel are:

- Configure the memory address from where the image is to be sourced in the CHNL_IN_BUF_ADDR[ADDR].
- Configure the line and frame pitch in the CHNL_IN_BUF_PITCH register.
- Configure the read image format in the CHNL_MEM_RD_CTRL[IMG_TYPE] field.
- Complete the initialization of other blocks and interrupts for channel 0 and set CHNL_CTRL[CHNL_EN] = 1.
- Set the CHNL_MEM_RD_CTRL[READ_MEM] = 1 to enable reading of frame from memory.
- Wait for CHNL_STS[MEM_RD_DONE] interrupt to set before initiating a new image read. When this interrupt occurs, set CHNL_MEM_RD_CTRL[READ_MEM] = 0 followed by CHNL_MEM_RD_CTRL[READ_MEM] = 1 to start the next read.

NOTE

- When hardware controlled reading is enabled, then software controlled reads will not be available, and vice-versa.
- Only one channel can perform read at a given time.

13.4.3.8 Flow Control

The ISI implements the following flow control mechanisms to compensate for low bandwidth on the device's AXI bus:

- **Panic and overflow**
  - ISI provides a "panic" signal to the subsystem to request for higher priority on the AXI write channel to empty the ping pong buffers before they overflow. The assertion of panic signal can be set to assert when the output ping pong buffers get filled to a certain configurable threshold. Depending on the reaction time from subsystem, the appropriate threshold can be set in the CHNL_OUT_BUF_CTRL[OFLW_PANIC_SET_THD_n] bits, where n = Y, U, V. The panic signal de-asserts when the amount of data inside the ping pong buffers goes below the configurable threshold.
  - The panic status is also indicated via interrupt bits - CHNL_STS[PANIC_n_BUF], where n = Y, U, V. The status bits do not clear if the amount of data inside the ping pong buffers goes below the configurable threshold.

    - In case an overflow does occur, ISI aborts storing pixels from the current line and resyncs to the next line and starts storing pixels thereon. The status of overflow in buffers is indicated via interrupt bits - CHNL_STS[OFLW_n_BUF], where n = Y, U, V.
    - Enable overflow and panic interrupts for the channel in the CHNL_IER register.
- **Back pressure to stall internal pipeline**
    - ISI implements an automatic back pressure to stall the channel's pipeline in case the AXI bus is not ready to accept data and the ping pong buffers have 128-bytes of space left.
    - The back pressure to the channel pipeline is asserted when scaler line buffers are flushed between frames or image is sourced from memory.
    - However, data can still be lost during scaler line buffer flushing if the back pressure stalls the pipeline for too long. This could happen when a new frame starts and flush is not completed due to back pressure. In this case, ISI moves to process the next frame and indicates an overflow error.
- **Adjustable flow rate**
    - ISI provides registers to configure the rate at which pixels are processed in the pipeline when image is sourced from memory and/or when scaler line buffers are flushed. By default the rate is one pixel per clock, assuming read buffers are full with data.
    - Normally, the camera rate would be less than 1 pixel per clock and during flushing the high rate can peak the bandwidth demand on AXI bus. Using the CHNL_FLOW_CTRL register, software can program the rate to match the camera rate as desired.
    - The rate is programmed as a ratio in the CHNL_FLOW_CTRL[FC_NUMER] and CHNL_FLOW_CTRL[FC_DENOM]. ISI will send pixels for FC_NUMER number of clocks out of FC_DENOM clocks.

Return to initialization steps to complete the initialization of other blocks and enabling the channel.

13.4.3.9 Error Resiliency

ISI implements resiliency against possible error frames and recovery from them. An error frame can have one of the following:

- HSYNC at the wrong time, thereby causing less/more pixels in frame. ISI recovers silently and there is no indication of this error event.

- VSYNC at the wrong time, thereby causing less/more lines in frame. ISI asserts CHNL_STS[EARLY_VSYNC] or CHNL_STS[LATE_VSYNC] interrupts bits to indicate to the software about this condition and ISI resyncs to the next frame. Enable the interrupt by writing '1' to the corresponding interrupt enable bit in the CHNL_IER regsiter.
- Unequal lines between interlaced fields. The ISI expects both frames to have equal number of lines and will assert CHNL_STS[EARLY_VSYNC] for the interlaced frame that has less lines that the other frame.
- Missing or extra interlaced field (odd or even). ISI will mask out the unexpected field and not flag any error in this event.
- Frame with no pixels. ISI recovers silently and there is no indication of this error event.
- Frame line with no pixels. ISI recovers silently and there is no indication of this error event.

All the error resiliency mechanisms ensure that the frame is not stored outside its given memory range in the event of an error frame being received by ISI.

13.4.3.10 Clocking constraint

The clocking requirement for ISI module is that the processing clock must be greater than or equal to the incoming pixel link clock. The reason for this is that ISI can process one pixel per processing clock while the incoming pixel link can input one pixel per pixel link clock. If the incoming pixel link is faster than the processing clock, then the ISI can lose data as data is coming in faster than it can process it.

13.4.4 External Signals

There are no device I/O signals associated with this module.

13.4.5 Memory Map and register definition

This section includes the ISI module memory map and detailed descriptions of all registers.

NOTE

Software must ensure correctness of values being programmed to ensure smooth operation. The module does not check for correctness.

13.4.5.1 ISI Memory Map register descriptions

The memory map comprises of 32-bit aligned registers which can be accessed via 32-bit accesses only. Write access to reserved locations will generate transfer error. Read access to reserved locations will also generate transfer error and the read data bus will show all 0s.

The module will not check for correctness of programmed values in the registers and software must ensure that correct values are being written.

13.4.5.1.1 ISI memory map

ISI base address: 32E0_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h	Channel Control Register (CHNL_CTRL)	32	RW	0000_0000h

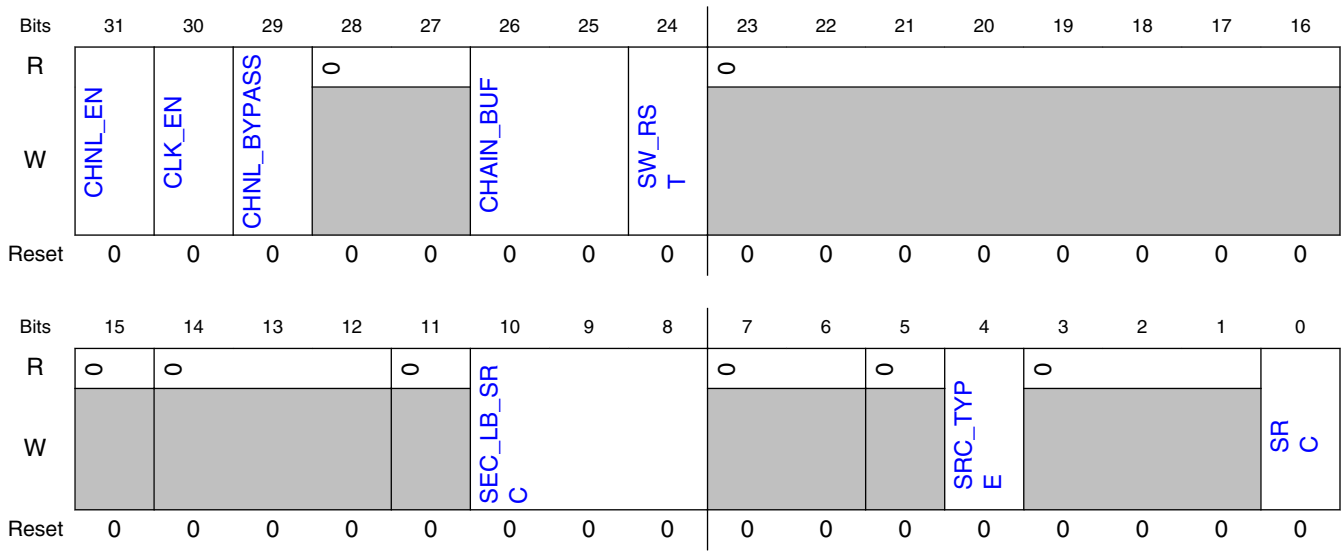
13.4.5.1.2 Channel Control Register (CHNL_CTRL)



13.4.5.1.2.1 Offset

Register	Offset
CHNL_CTRL	0h

13.4.5.1.2.2 Function

This register provides the global settings for the channel pipeline and controls how the internal blocks and line buffer perform the image processing.

13.4.5.1.2.3 Diagram

13.4.5.1.2.4 Fields

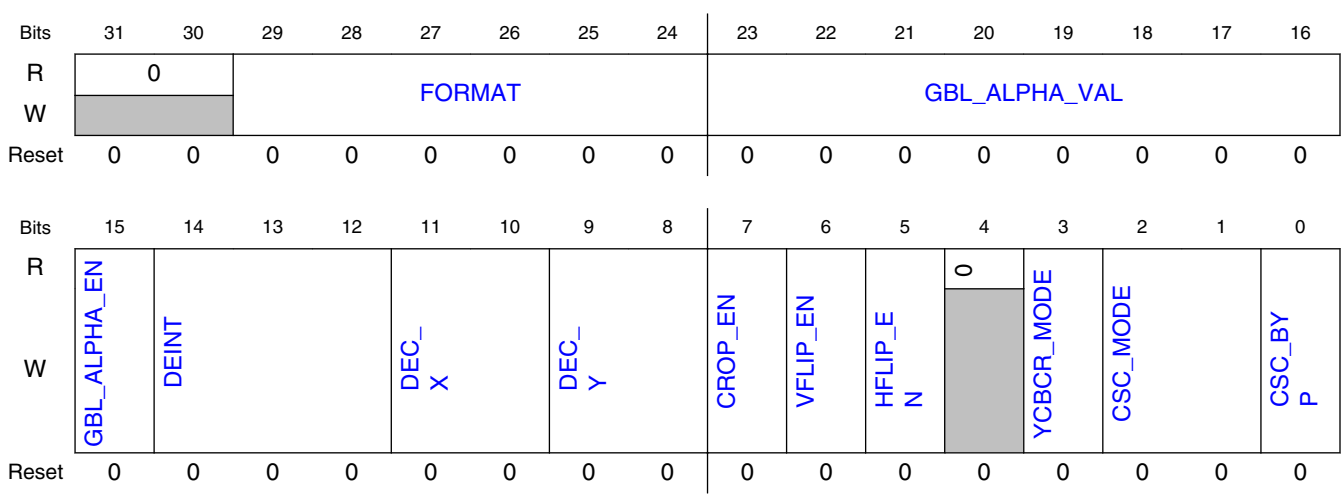
Field	Function
31 CHNL_EN	Enable channel processing Enables the image processing in the channel. This bit must be set last. All other channel configuration must happen prior to setting this bit. 0b - Processing channel is disabled 1b - Processing channel is enabled
30 CLK_EN	Channel clock enable This bit controls the clock enable for the channel processing clock. When set to '1' the clock gating (outside the ISI block) is disabled and clock to the channel is enabled. 0b - Channel processing clock is disabled 1b - Channel processing clock is enabled
29 CHNL_BYPASS	Channel bypass enable For certain applications, the ISI module might not be required to do any scaling nor color space conversion on the image. For such cases, this bit should be set to bypass the channel pipeline and store the image into memory. The output image format CHNLn_IMG_CTRL[FORMAT] field should be set to same as the incoming image format. Image flipping, cropping and alpha insertion can still be carried out. **NOTE:** For de-interlacing purposes, the channel is automatically bypassed for one frame; but this bit should not be set for de-interlacing **NOTE:** If this bit is set, CSC will be bypassed even if CHNL_IMG_CTRL[CSC_BYP] is not set. 0b - Channel is not bypassed 1b - Channel is bypassed
28-27 —	Reserved field. Reads only zeros
26-25 CHAIN_BUF	Chain line buffer control For images having higher than 2048 horizontal resolution (pixels), the line buffer RAM (for channel 'n') will require to be concatenated with channel 'n+1' line buffer RAM to provide a larger storage. This field

Table continues on the next page...

Field	Function
	controls how the adjacent channel line buffer RAM are chained together. For example when this field is set to '01', line buffers (for channel 'n' and 'n+1') are chained; the channel 'n+1' cannot be enabled and are blocked for use. 00b - No line buffers chained (supports 2048 or less horizontal resolution) 01b - 2 line buffers chained (supports 4096 horizontal resolution). Line buffers of channels 'n' and 'n +1' are chained. 10b - Reserved for future use 11b - Reserved for future use
24 SW_RST	Software reset bit Writng a '1' to this bit will reset the processing pipeline similar to a hardware reset. This bit does not self clear and hence when writing a '1', software must allow suffucient delay (4 to 6 NOP cycles) for reset propagation before writing a '0' to disable the software reset. **NOTE:** Asserting the software reset does not clear the registers. It will affect the processing pipeline and the Memory Read Control. Any on-going AXI transactions will complete and will not be interrupted by the software reset. 0b - No Reset 1b - Channel pipeline is under software reset
23-15 —	Reserved field. Reads only zeros
14-12 —	Reserved field. Reads only zeros
11 —	Reserved field. Reads only zeros
10-8 SEC_LB_SRC	Secondary line buffer source Specifies the channel number whose line buffer will be used as the secondary line buffer in the primary channel performing YUV420 scaling. This field will be ignored for other cases. When this field is set, the primary channel takes over control of the secondary channel's line buffer. The secondary channel cannot be used for any processing. **NOTE:** When performing YUV420 scaling, care should be given that an existing functional channel's line buffer should not be used including the same channel itself. Doing so could result in unexpected results in both channels. Note that the line buffers are the internal storage of the channel and not the output memory buffers.
7-6 —	Reserved bits. Reads only zeros.
5 —	Reserved field. Reads only zeros
4 SRC_TYPE	Type of selected input image source Defines the type of image input source. Should be set to '1' only when source of image is from memory. For all other sources, this bit is '0'. 0b - Image input source is Pixel Link 1b - Image input source is Memory
3-1 —	Reserved field. Reads only zeros
0 SRC	Input image source port selection

Field	Function
	Source selects the desired input port of the Pixel Link Crossbar from which the image will be sourced. This field should not be changed when the channel pipeline is working and must be configured prior to enabling the channel processing. 0b - Image will be sourced from input port 0 of the Pixel Link Crossbar 1b - Image will be sourced from input port 1 of the Pixel Link Crossbar When SRC_TYPE is set to select Memory as the image input source, this bit is ignored.

13.4.5.1.3 Channel Image Control Register (CHNL_IMG_CTRL)



13.4.5.1.3.1 Offset

Register	Offset
CHNL_IMG_CTRL	4h

13.4.5.1.3.2 Function

This register prvoides bits that control how the input image is processed in the processing pipeline/channel.

13.4.5.1.3.3 Diagram

13.4.5.1.3.4 Fields

Field	Function
31-30	Reserved field. Reads only zeros

Table continues on the next page...

Field	Function
RSVD0	
29-24 FORMAT	Output image format This field specifies the image format to be used when storing the image output from channel pipeline to memory. The UV byte lanes are synonymous with CbCr byte lanes for YUV output pixel formats. For example, the YUV420_2P* formats should be selected when the output is YCbCr 2-plane 420 output format. **NOTE:** For RAW pixel formats, if the output pixel format has few bits per pixel than the input pixel format, the most significant bits of each pixel are truncated by the ISP. 000000b - RGBA8888 - RGB format with alpha in LSB; 8-bits per component. 'A' indicates alpha value. 000001b - ABGR8888 - BGR format with alpha in MSB; 8-bits per component. 'A' indicates alpha value. 000010b - ARGB8888 - RGB format with alpha in MSB; 8-bits per component. 'A' indicates alpha value. 000011b - RGBX888 - RGB format with 8-bits per color component (unpacked and MSB-alinged in 32-bit DWORD). 'X' indicates the waste bits. 000100b - XBGR888 - BGR format with 8-bits per color component (unpacked and LSB aligned in 32-bit DWORD). 'X' indicates the waste bits. 000101b - XRGB888 - RGB format with 8-bits per color component (unpacked and LSB aligned in 32-bit DWORD). 'X' indicates the waste bits. 000110b - RGB888P - RGB format with 8-bits per color component (packed into 24-bits). No waste bits. 000111b - BGR888P - BGR format with 8-bits per color component (packed into 24-bits). No waste bits. 001000b - A2BGR10 - BGR format with 2-bits alpha in MSB; 10-bits per color component. 'A' indicates alpha value. 001001b - A2RGB10 - RGB format with 2-bits alpha in MSB; 10-bits per color component. 'A' indicates alpha value. 001010b - RGB565 - RGB format with 5-bits of R, B; 6-bits of G (packed into 16-bits WORD). No waste bits. 001011b - RAW8 - 8-bit RAW data packed into 32-bit DWORD 001100b - RAW10 - 10-bit RAW data packed into 16-bit WORD with 6 LSBs waste bits 001101b - RAW10P - 10-bit RAW data packed into 32-bit DWORD 001110b - RAW12 - 12-bit RAW data packed into 16-bit DWORD with 4 LSBs waste bits 001111b - RAW16 - 16-bit RAW data packed into 32-bit DWORD 010000b - YUV444_1P8P with 8-bits per color component; 1-plane, YUV interleaved packed bytes 010001b - YUV444_2P8P with 8-bits per color component; 2-plane, UV interleaved packed bytes 010010b - YUV444_3P8P with 8-bits per color component; 3-plane, non-interleaved packed bytes 010011b - YUV444_1P8 with 8-bits per color component; 1-plane YUV interleaved unpacked bytes (8 MSBs waste bits in 32-bit DWORD) 010100b - YUV444_1P10 with 10-bits per color component; 1-plane, YUV interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 010101b - YUV444_2P10 with 10-bits per color component; 2-plane, UV interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 010110b - YUV444_3P10 with 10-bits per color component; 3-plane, non-interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 010111b - Reserved for future use 011000b - YUV444_1P10P with 10-bits per color component; 1-plane, YUV interleaved packed bytes (2 MSBs waste bits in 32-bit DWORD) 011001b - YUV444_2P10P with 10-bits per color component; 2-plane, UV interleaved packed bytes (2 MSBs waste bits in 32-bit DWORD) 011010b - YUV444_3P10P with 10-bits per color component; 3-plane, non-interleaved packed bytes (2 MSBs waste bits in 32-bit DWORD) 011011b - Reserved for future use

Table continues on the next page...

Field	Function
	011100b - YUV444_1P12 with 12-bits per color component; 1-plane, YUV interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD) 011101b - YUV444_2P12 with 12-bits per color component; 2-plane, UV interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD) 011110b - YUV444_3P12 with 12-bits per color component; 3-plane, non-interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD) 011111b - Reserved for future use 100000b - YUV422_1P8P with 8-bits per color component; 1-plane, YUV interleaved packed bytes 100001b - YUV422_2P8P with 8-bits per color component; 2-plane, UV interleaved packed bytes 100010b - YUV422_3P8P with 8-bits per color component; 3-plane, non-interleaved packed bytes 100011b - Reserved for future use 100100b - YUV422_1P10 with 10-bits per color component; 1-plane, YUV interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 100101b - YUV422_2P10 with 10-bits per color component; 2-plane, UV interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 100110b - YUV422_3P10 with 10-bits per color component; 3-plane, non-interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 100111b - Reserved for future use 101000b - YUV422_1P10P with 10-bits per color component; 1-plane, YUV interleaved packed bytes (2 MSBs waste bits in 32-bit DWORD) 101001b - YUV422_2P10P with 10-bits per color component; 2-plane, UV interleaved packed bytes (2 MSBs waste bits in 32-bit DWORD) 101010b - YUV422_3P10P with 10-bits per color component; 3-plane, non-interleaved packed bytes (2 MSBs waste bits in 32-bit DWORD) 101011b - Reserved for future use 101100b - YUV422_1P12 with 12-bits per color component; 1-plane, YUV interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD) 101101b - YUV422_2P12 with 12-bits per color component; 2-plane, UV interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD) 101110b - YUV422_3P12 with 12-bits per color component; 3-plane, non-interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD) 101111b - Reserved for future use 110000b - Reserved for future use 110001b - YUV420_2P8P with 8-bits per color component; 2-plane, UV interleaved packed bytes 110010b - YUV420_3P8P with 8-bits per color component; 3-plane, non-interleaved packed bytes 110011b - Reserved for future use 110100b - Reserved for future use 110101b - YUV420_2P10 with 10-bits per color component; 2-plane, UV interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 110110b - YUV420_3P10 with 10-bits per color component; 3-plane, non-interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 110111b - Reserved for future use 111000b - Reserved for future use 111001b - YUV420_2P10P with 10-bits per color component; 2-plane, UV interleaved packed bytes (2 MSBs waste bits in 32-bit DWORD) 111010b - YUV420_3P10P with 10-bits per color component; 3-plane, non-interleaved packed bytes (2 MSBs waste bits in 32-bit DWORD) 111011b - Reserved for future use 111100b - Reserved for future use 111101b - YUV420_2P12 with 12-bits per color component; 2-plane, UV interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD) 111110b - YUV420_3P12 with 12-bits per color component; 3-plane, non-interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD) 111111b - Reserved for future use
23-16	Global alpha value

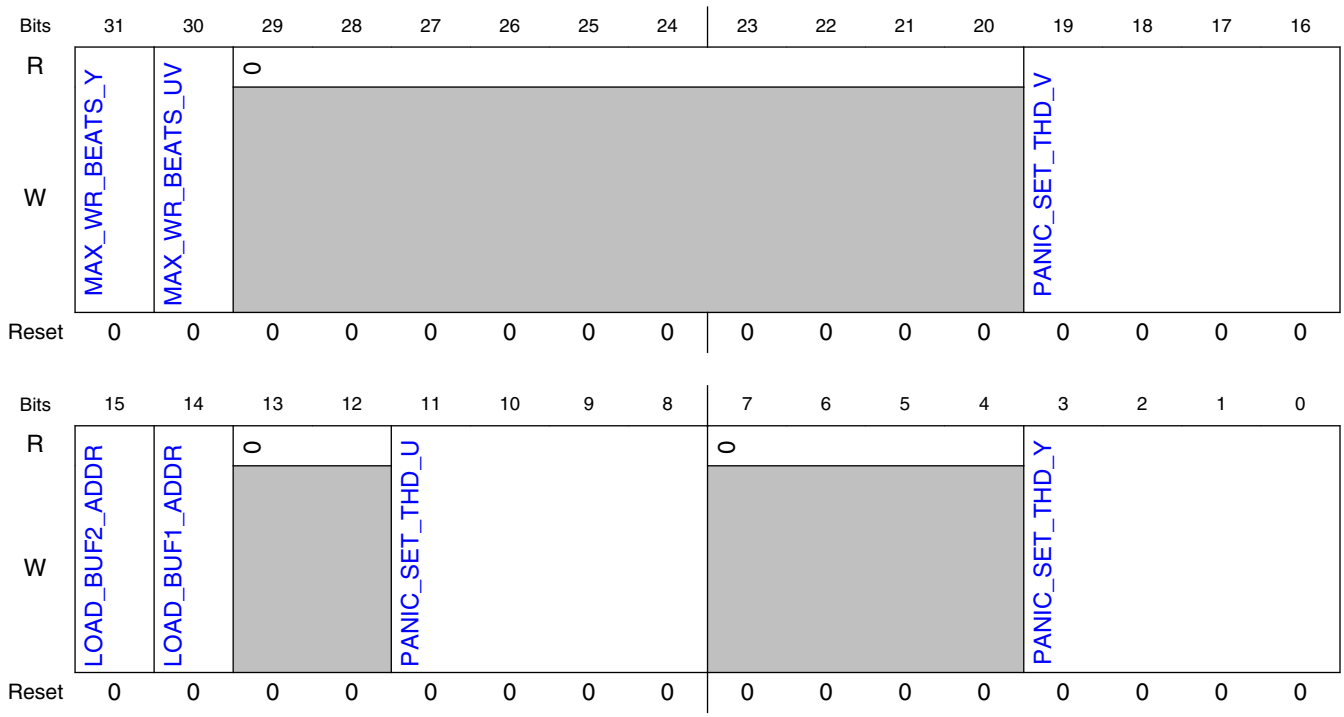
Table continues on the next page...

Field	Function
GBL_ALPHA_VAL	This is the alpha value that will be inserted with all RGB pixels in the image when being stored into the memory. For RGB 10-bit formats, only 2 MSbits will be used as alpha value for insertion. When different alpha values are required to be inserted in upto 4 regions of interest then the ROI_x_ALPHA, ROI_x_ULC and ROI_x_LRC regsiters should be used. 00000000-11111111b - Alpha value to be inserted with all RGB pixels
15 GBL_ALPHA_EN	Global alpha value insertion enable This bit controls if the global alpha value will be inserted in the RGB image or not. When different alpha values are required to be inserted in upto 4 regions of interest then the ROI_x_ALPHA, ROI_x_ULC and ROI_x_LRC regsiters should be used. 0b - Global Alpha value insertion is disabled 1b - Global Alpha value insertion is enabled
14-12 DEINT	De-interlace control Frames that are interlaced when sent over the pixel link require de-interlacing. This field defines the basic de-interlacing method that will be used to combine the interlaced frames. Refer to Functional Description for more details on deinterlacing techniques and how to configure the channels to perform de-interlacing. 000, 001b - No de-interlacing done 010b - Weave de-interlacing (Odd, Even) method used 011b - Weave de-interlacing (Even, Odd) method used 100b - Blending or linear interpolation (Odd + Even) de-interlacing method used 101b - Blending or linear interpolation (Even + Odd) de-interlacing method used 110, 111b - Line doubling de-interlacing method used. Both Odd and Even fields are doubled.
11-10 DEC_X	Horizontal pre-decimation control This field controls the pre-decimation filter for down scaling of the input image in the horizontal direction. 00b - Pre-decimation filter is disabled. Bilinear scaling filter is still operational. 01b - Decimate by 2 10b - Decimate by 4 11b - Decimate by 8
9-8 DEC_Y	Vertical pre-decimation control This field controls the pre-decimation filter for down scaling of the input image in the vertical direction. 00b - Pre-decimation filter is disabled. Bilinear scaling filter is still operational. 01b - Decimate by 2 10b - Decimate by 4 11b - Decimate by 8
7 CROP_EN	Output image cropping enable When set to '1', this bit enables cropping of the image. Cropping of image is carried out after down scaling. Hence, the cropping coordinates should be programmed with respect to scaled image. The cropping coordinates are configured in the CROP_ULC and CROP_LRC registers. 0b - Image cropping is disabled 1b - Image cropping is enabled
6 VFLIP_EN	Veritical flip control When set to '1', this bit enables vertical image flipping. 0b - Vertical image flip disabled 1b - Vertical image flip enabled
5 HFLIP_EN	Horizontal flip control When set to '1', this bit enables horizontal image flipping. 0b - Horizantal image flip disabled 1b - Horizontal image flip enabled
4 RSVD2	Reserved field. Reads only zeros
3	YCbCr Mode

Table continues on the next page...

Field	Function
YCBCR_MODE	Set to 1 when performing YCbCr conversion to RGB. Set to 0 when converting RGB to YUV data. This bit changes the behavior of the scaler when performing U/V scaling. 0b - YCbCr mode is disabled 1b - YCbCr mode is enabled
2-1 CSC_MODE	Color Space Conversion operating mode This field controls how the CSC unit operates on pixels when the CSC is not bypassed. 00b - Convert from YUV to RGB 01b - Convert from YCbCr to RGB 10b - Convert from RGB to YUV 11b - Convert from RGB to YCbCr
0 CSC_BYP	Color Space Conversion bypass control When set to '1', the color space convertor block is bypassed and no operation occurs on the pixels. When set to '0', color conversion selected by the CSC_MODE bits takes place. 0b - CSC is operational 1b - CSC is bypassed

13.4.5.1.4 Channel Output Buffer Control Register (CHNL_OUT_BUF_CTRL)



13.4.5.1.4.1 Offset

Register	Offset
CHNL_OUT_BUF_CTRL	8h

13.4.5.1.4.2 Function

This register controls how the output buffer loads the destination memory address and configures the overflow panic controls.

13.4.5.1.4.3 Diagram

13.4.5.1.4.4 Fields

Field	Function
31 MAX_WR_BEATS_Y	Maximum AXI write beats for Y-buffer When Y-buffer is concatenated with other buffers (i.e. Y+U+V or Y+V), software has the option to increase throughput by increasing the maxmium write beats to 16 (i.e. 256 bytes) per write request. When buffer is not combined, this bit has no effect and maximum of 8-beats per write request are supported. 0b - Maximum write beats per write request are 8 (i.e. 128 bytes) 1b - Maximum write beats per write request are 16 (i.e. 256 bytes)
30 MAX_WR_BEATS_UV	Maximum AXI write beats for U and V-buffers When U-buffer and V-buffer are concatenated, software has the option to increase throughput by increasing the maxmium write beats to 16 (i.e. 256 bytes) per write request. When buffers are not combined, this bit has no effect and maximum of 8-beats per write request are supported. 0b - Maximum write beats per write request are 8 (i.e. 128 bytes) 1b - Maximum write beats per write request are 16 (i.e. 256 bytes)
29-20 —	Reserved field. Reads only zeros
19-16 PANIC_SET_THD_V	Overflow panic set threshold value for V output buffer This field provides the threshold after which the Potential Overflow Panic Alert Interrupt (STS[OFLW_PANIC_V_BUF]) and Panic signal to subsystem will be asserted to request higher priority on AXI to drain the output buffers of the channel. Panic signal will de-assert when the amount of filled rows in ping pong buffer fall below the programmed threshold. Panic interrupt bit will clear when a '1' is written to it. 0000b - No panic alert will be asserted

Table continues on the next page...

Field	Function
	0001-1111b - Panic will assert when buffer is n * 6.25% full, where n = 1 to 15
15 LOAD_BUF2_ADDR	Load Buffer 2 Address from CHNLOUT_BUF2_ADDR_* registers When a new value is required to be used, software must toggle this bit to indicate a new buffer address has been programmed for use. On every toggle of this bit, the new address values will be shadowed in design.
14 LOAD_BUF1_ADDR	Load Buffer 1 Address from CHNLOUT_BUF1_ADDR_* registers When a new value is required to be used, software must toggle this bit to indicate a new buffer address has been programmed for use. On every toggle of this bit, the new address values will be shadowed in design.
13-12 —	Reserved field. Reads only zeros
11-8 PANIC_SET_THD_U	Overflow panic set threshold value for U output buffer This field provides the threshold after which the Potential Overflow Panic Alert Interrupt (STS[OFLW_PANIC_U_BUF]) and Panic signal to subsystem will be asserted to request higher priority on AXI to drain the output buffers of the channel. Panic signal will de-assert when the amount of filled rows in ping pong buffer fall below the programmed threshold. Panic interrupt bit will clear when a '1' is written to it. 0000b - No panic alert will be asserted 0001-1111b - Panic will assert when buffer is n * 6.25% full, where n = 1 to 15
7-4 —	Reserved field. Reads only zeros
3-0 PANIC_SET_THD_Y	Overflow panic set threshold value for Y/RGB output buffer This field provides the threshold after which the Potential Overflow Panic Alert Interrupt (STS[OFLW_PANIC_Y_BUF]) and Panic signal to subsystem will be asserted to request higher priority on AXI to drain the output buffers of the channel. Panic signal will de-assert when the amount of filled rows in ping pong buffer fall below the programmed threshold. Panic interrupt bit will clear when a '1' is written to it. 0000b - No panic alert will be asserted 0001-1111b - Panic will assert when buffer is n * 6.25% full, where n = 1 to 15

13.4.5.1.5 Channel Image Configuration (CHNL_IMG_CFG)

13.4.5.1.5.1 Offset

Register	Offset
CHNL_IMG_CFG	Ch

13.4.5.1.5.2 Function

This register provides the details about the image width (pixels) and height (lines). This register can be used to specify the image resolution for any type of source for the processing channel.

13.4.5.1.5.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

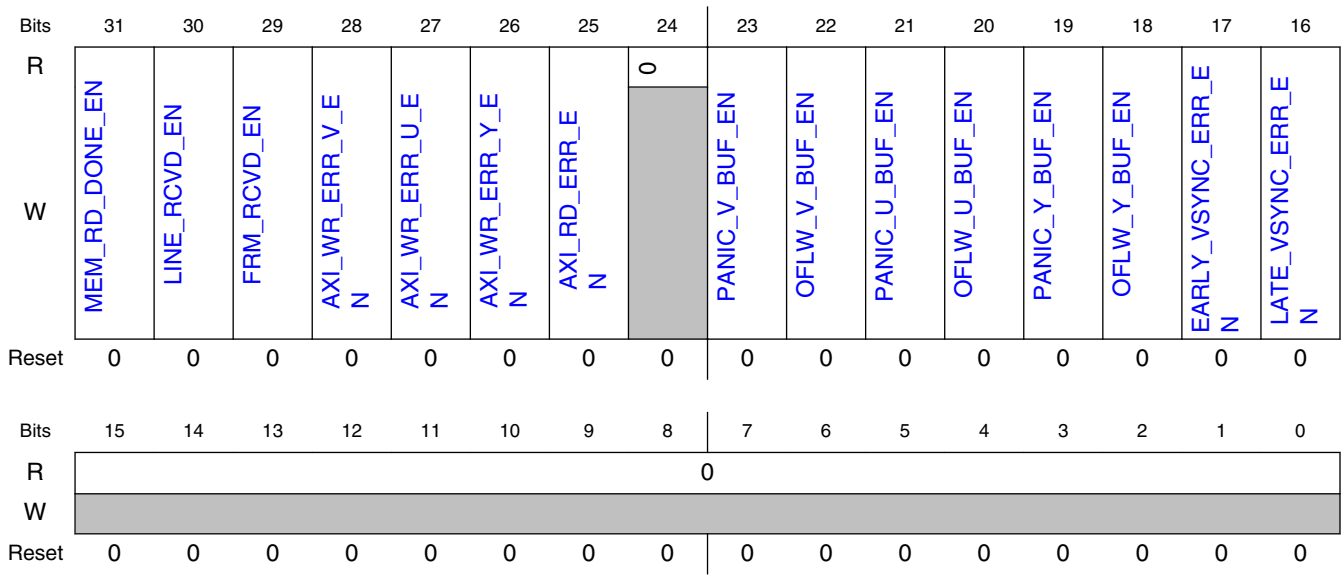
13.4.5.1.5.4 Fields

Field	Function
31-29 RSVD1	Reserved field. Reads only zeros.
28-16 HEIGHT	Input image height (lines) This field provides the height of input image in terms of number of lines for both cases when the image is input from pixel link or from memory. Default height is 1080 lines.
15-13 RSVD0	Reserved field. Reads only zeros.
12-0 WIDTH	Input image width (pixels) This field provides the width of input image in terms of number of pixels for both cases when the image is input from pixel link or from memory. Default width is 1920 pixels.

13.4.5.1.6 Channel Interrupt Enable Register (CHNL_IER)



13.4.5.1.6.1 Offset

Register	Offset
CHNL_IER	10h

13.4.5.1.6.2 Function

This register provides bits to enable the generation of interrupt to the processor.

13.4.5.1.6.3 Diagram

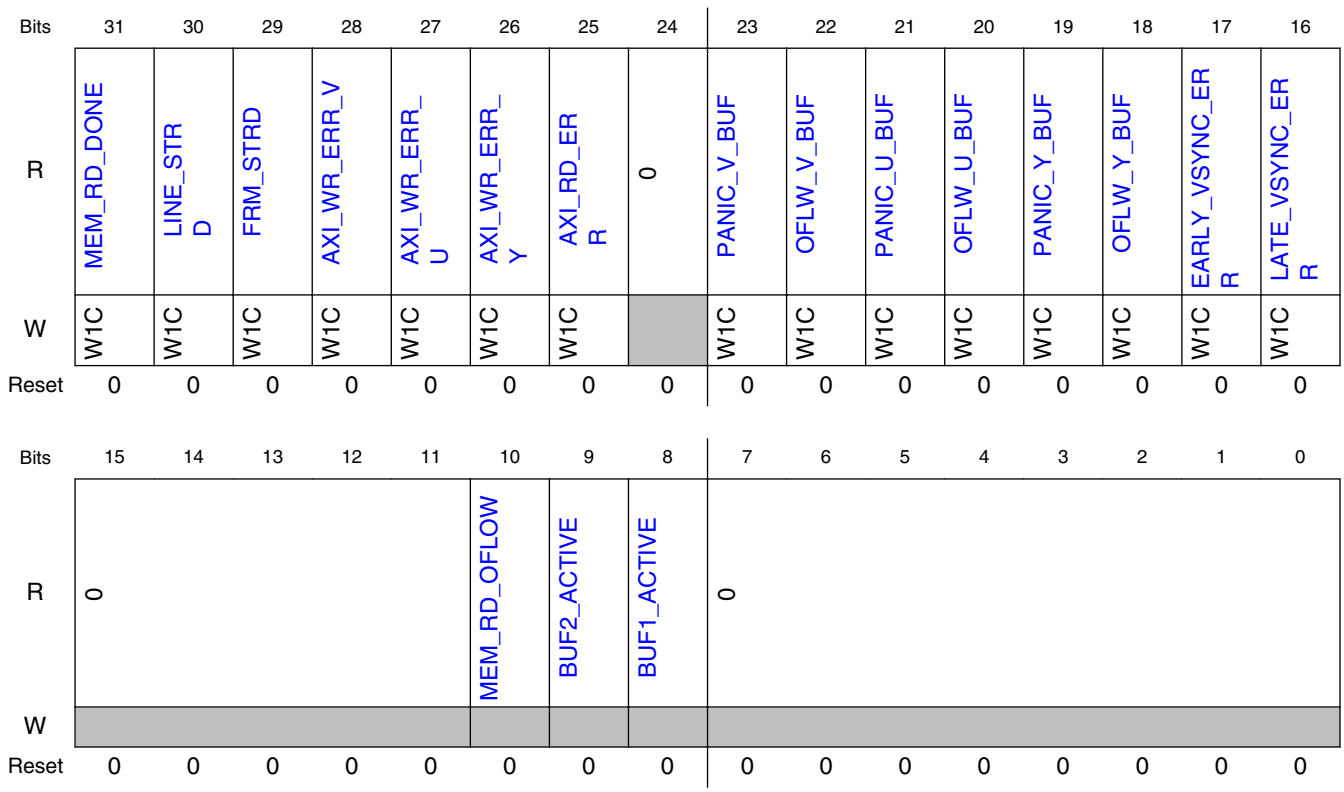
13.4.5.1.6.4 Fields

Field	Function
31 MEM_RD_DONE_EN	Memory read complete interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
30 LINE_RCVD_EN	Line received interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
29 FRM_RCVD_EN	Frame received interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
28 AXI_WR_ERR_V_EN	AXI bus read error interrupt enable bit for V data buffer Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
27 AXI_WR_ERR_U_EN	AXI bus read error interrupt enable bit for U data buffer Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
26 AXI_WR_ERR_Y_EN	AXI bus read error interrupt enable bit for Y/RGB data buffer Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled

Table continues on the next page...

Field	Function
25 AXI_RD_ERR_EN	AXI bus read error interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
24 —	Reserved
23 PANIC_V_BUF_EN	V output buffer potential overflow panic interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
22 OFLW_V_BUF_EN	V output buffer overflow interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
21 PANIC_U_BUF_EN	U output buffer potential overflow panic interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
20 OFLW_U_BUF_EN	U output buffer overflow interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
19 PANIC_Y_BUF_EN	Y output buffer potential overflow panic interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
18 OFLW_Y_BUF_EN	Y output buffer overflow interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
17 EARLY_VSYNC_ERR_EN	VSYNC timing (Early) error interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
16 LATE_VSYNC_ERR_EN	VSYNC timing (Late) error interrupt enable bit Enables assertion of interrupt from the channel when corresponding status bit is asserted. 0b - Interrupt is disabled 1b - Interrupt is enabled
15-0 RSVD0	Reserved field. Reads only zeros.

13.4.5.1.7 Channel Status Register (CHNL_STS)



13.4.5.1.7.1 Offset

Register	Offset
CHNL_STS	14h

13.4.5.1.7.2 Function

This register provides the interrupt bits and read only bits that give the status of the module.

13.4.5.1.7.3 Diagram

13.4.5.1.7.4 Fields

Field	Function
31 MEM_RD_DONE	Memory read complete interrupt flag Indicates that the channel has read the full image from the input memory location (IN_BUF_ADDR) and software should configure the system for next image to be read from memory. 0b - Image read from memory not complete or not started 1b - Image read from memory completed

Table continues on the next page...

Field	Function
30 LINE_STRD	Line received and stored interrupt flag Indicates that a line has been received and stored into memory. This interrupt flag asserts for every line received and stored into memory. 0b - No new line received 1b - New line received and stored into memory
29 FRM_STRD	Frame stored successfully interrupt flag Indicates that a frame has been received and stored into memory. This interrupt flag will assert for every frame received and stored into memory. 0b - No frame being received or in progress 1b - One full frame has been received and stored in memory
28 AXI_WR_ERR_V	AXI Bus write error interrupt flag for V data buffer Indicates an error occured on the AXI Bus when storing V data to memory. 0b - No error 1b - Error occured during write
27 AXI_WR_ERR_U	AXI Bus write error interrupt flag for U data buffer Indicates an error occured on the AXI Bus when storing U data to memory. 0b - No error 1b - Error occured during write
26 AXI_WR_ERR_Y	AXI Bus write error interrupt flag for Y/RGB data buffer Indicates an error occured on the AXI Bus when storing Y/RGB data to memory. 0b - No error 1b - Error occured during write
25 AXI_RD_ERR	AXI Bus read error interrupt flag Indicates an error occured on the AXI Bus when reading image data to memory. 0b - No error 1b - Error occured during read
24 —	Reserved
23 PANIC_V_BUF	V output buffer potential overflow panic alert interrupt flag Indicates that the channel requires the software to increase the AXI bus priority for the V channel so that it can empty its output buffers otherwise the buffer might overflow and loose valid pixel data. Software must take action on this interrupt such that buffers are emptied out before any overflow occurs. The threshold for this panic interrupt can be set in the OUT_BUF_CTRL register. 0b - Buffer has not crossed the panic threshold limit 1b - Panic threshold limit crossed. Software must take action.
22 OFLW_V_BUF	Overflow in U output buffer interrupt flag Indicates overflow due to internal buffers not being read via AXI and are now full and not accepting new valid pixels in the output buffer control stage. The number of bytes lost during the overflow event is also reported in the status register. 0b - No overflow 1b - Overflow has occured in the channel
21 PANIC_U_BUF	U output buffer potential overflow panic alert interrupt flag Indicates that the channel requires the software to increase the AXI bus priority for the U channel so that it can empty its output buffers otherwise the buffer might overflow and loose valid pixel data. Software must take action on this interrupt such that buffers are emptied out before any overflow occurs. The threshold for this panic interrupt can be set in the OUT_BUF_CTRL register. 0b - Buffer has not crossed the panic threshold limit 1b - Panic threshold limit crossed. Software must take action.

Table continues on the next page...

Field	Function
20 OFLW_U_BUF	Overflow in U output buffer interrupt flag Indicates overflow due to internal buffers not being read via AXI and are now full and not accepting new valid pixels in the output buffer control stage. The number of bytes lost during the overflow event is also reported in the status register. 0b - No overflow 1b - Overflow has occured in the channel
19 PANIC_Y_BUF	Y/RGB output buffer potential overflow panic alert interrupt flag Indicates that the channel requires the software to increase the AXI bus priority for the Y/RGB channel so that it can empty its output buffers otherwise the buffer might overflow and loose valid pixel data. Software must take action on this interrupt such that buffers are emptied out before any overflow occurs. The threshold for this panic interrupt can be set in the OUT_BUF_CTRL register. 0b - Buffer has not crossed the panic threshold limit 1b - Panic threshold limit crossed. Software must take action.
18 OFLW_Y_BUF	Overflow in Y/RGB output buffer interrupt flag Indicates overflow due to internal buffers not being read via AXI and are now full and not accepting new valid pixels in the output buffer control stage. The number of bytes lost during the overflow event is also reported in the status register. 0b - No overflow 1b - Overflow has occured in the channel
17 EARLY_VSYNC_ERR	VSYNC timing (Early) error interrupt flag Indicates that the VSYNC for the frame was detected earlier than expected. The resultant frame will have corrupt data. 0b - No error 1b - VSYNC detected earlier than expected
16 LATE_VSYNC_ERR	VSYNC timing (Late) error interrupt flag Indicates that the VSYNC for the frame was detected later than expected. The resultant frame will have correct data. The extra lines in frame will be ignored. 0b - No error 1b - VSYNC detected later than expected
15-11 RSVD1	Reserved field. Reads only zeros.
10 MEM_RD_OFLOW	Memory read FIFO overflow error status Read only bit that indicates that read from memory has caused an internal FIFO to overflow. Data loss has occurred during memory read. Status is valid only when a memory read has been initiated. 0b - No overflow occurred during memory read 1b - FIFO overflow occurred during memory read
9 BUF2_ACTIVE	Current frame being stored in Buffer 2 Address Read only bit that indicates Buffer 2 Address is being used to store current frame. 0b - Buffer 2 Address inactive 1b - Buffer 2 Address in use
8 BUF1_ACTIVE	Current frame being stored in Buffer 1 Address Read only bit that indicates Buffer 1 Address is being used to store current frame. 0b - Buffer 1 Address inactive 1b - Buffer 1 Address in use
7-0 —	Reserved

13.4.5.1.8 Channel Scale Factor Register (CHNL_SCALE_FACTOR)

13.4.5.1.8.1 Offset

Register	Offset
CHNL_SCALE_FACTOR	18h

13.4.5.1.8.2 Function

This register provides the scale factor for the Bilinear Filter in the Scaling Engine. The maximum down scaling factor is 1/2 such that the output image in either axis is 1/2 the size of the source. The scale down factor can range from 1.0 to 2.0. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.

To reduce the image by a factor of two in the output frame buffer, a value of 10.0000_0000_0000 should be loaded into this register.

13.4.5.1.8.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0		Y_SCALE													
W																
Reset	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0

R	0		X_SCALE													
W																
Reset	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0

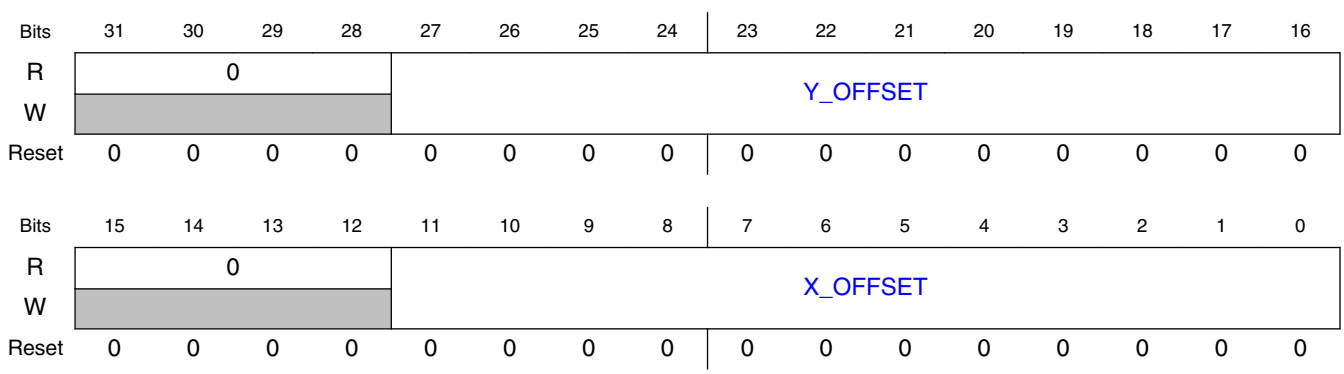
13.4.5.1.8.4 Fields

Field	Function
31-30 RSVD0	Reserved field. Reads only zeros
29-16 Y_SCALE	Vertical scaling factor This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the Y-dimension scaling factor for the bilinear filter. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter.
15-14 RSVD1	Reserved field. Reads only zeros

Table continues on the next page...

Field	Function
13-0 X_SCALE	Horizontal scaling factor This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the X-dimension scaling factor for the bilinear filter. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter.

13.4.5.1.9 Channel Scale Offset Register (CHNL_SCALE_OFFSET)



13.4.5.1.9.1 Offset

Register	Offset
CHNL_SCALE_OFFSET	1Ch

13.4.5.1.9.2 Function

This register provides the initial scale offset for the Bilinear Filter. The X and Y offset provides the ability to access the source image with a per sub-pixel granularity. This provides the capability to use all source pixels to effect the output image. The fixed offset values can be used for sub-pixel adjustments in the bilinear scaling filter. For example, when scaling an image down by a factor of 2, an initial offset of 0x0 would result in sub-sampling every other pixel. If a fixed offset of 0x800 (1/2), all pixels are used in scaling the final output pixel value. In this case, the first output pixel would be the sum of (1/2*P0) + (1/2*P1). This fixed offset is applied after the decimation filter stage, and before the bilinear filter stage.

13.4.5.1.9.3 Diagram

13.4.5.1.9.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 Y_OFFSET	Vertical scaling offset This is a 12 bit fractional representation (0.####_####_####) of the Y-dimension scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 X_OFFSET	Horizontal scaling offset This is a 12 bit fractional representation (0.####_####_####) of the X-dimension scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.

13.4.5.1.10 Channel Crop Upper Left Corner Coordinate Register (CHNL_CROP_ULC)

13.4.5.1.10.1 Offset

Register	Offset
CHNL_CROP_ULC	20h

13.4.5.1.10.2 Function

This register provides the upper left coordinate of the source image which has to be cropped. The ULC should be set as per the scaled image resolution (if scaler is enabled) and as per the input image resolution (if scaler is bypassed). The output image after cropping will comprise of pixels of the source image that are within the region specified by the upper left coordinate (ULC) and lower right coordinate (LRC) registers. Cropping operation will be done when CROP_EN bit is set to '1' in the IMG_CTRL register.

13.4.5.1.10.3 Diagram

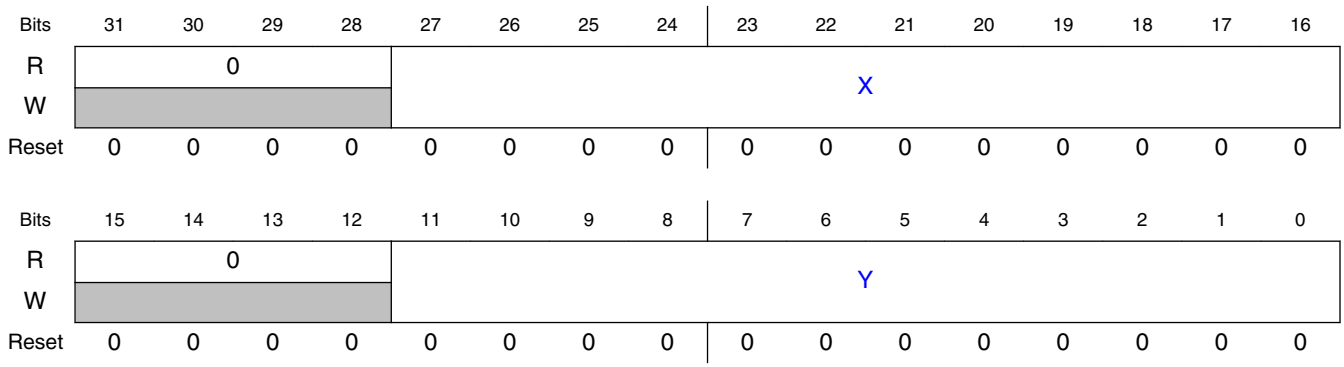
13.4.5.1.10.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Upper Left X-coordinate This field indicates the upper left X-coordinate (in pixels) of the scaled image. The range of valid values includes 0 to WIDTH - 1.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Upper Left Y-coordinate This field indicates the upper left Y-coordinate (in pixels) of the scaled image. The range of valid values includes 0 to HEIGHT - 1.

13.4.5.1.11 Channel Crop Lower Right Corner Coordinate Register (CHNL_CROP_LRC)

13.4.5.1.11.1 Offset



Register	Offset
CHNL_CROP_LRC	24h

13.4.5.1.11.2 Function

This register provides the lower right coordinate of the source image which has to be cropped. The LRC should be set as per the scaled image resolution (if scaler is enabled) and as per the input image resolution (if scaler is bypassed). The output image will comprise of pixels of the source image that are within the region specified by the upper

left coordinate (ULC) and lower right coordinate (LRC) registers. Cropping operation will be done when CROP_EN bit is set to '1' in the IMG_CTRL register.

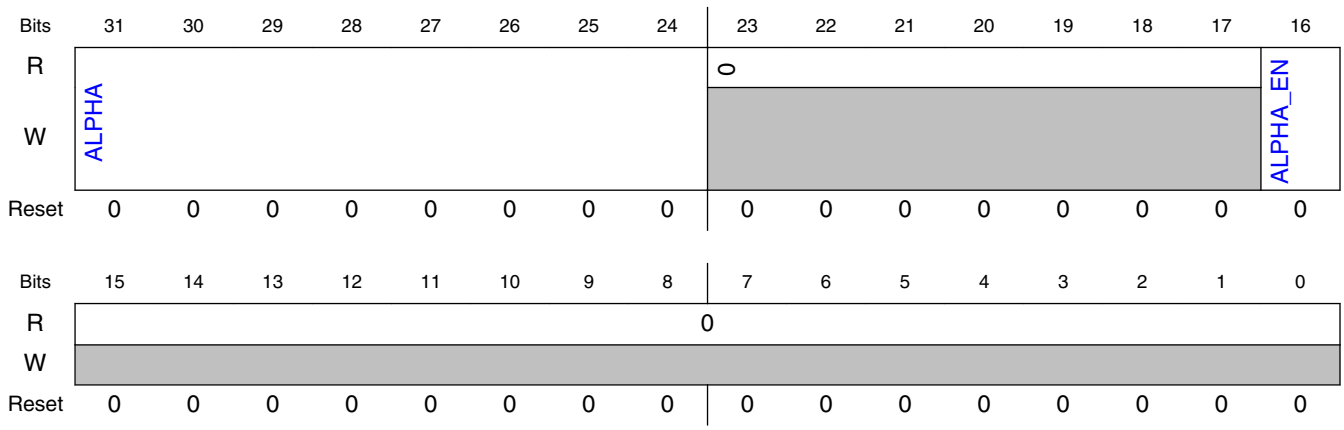
13.4.5.1.17.4 Fields

Field	Function
31-25 RSVD0	Reserved Field. Reads only zeros
24-16 D3	CSC Coefficient D3 value Two's complement coefficient integer offset to be added.
15-9 RSVD1	Reserved Field. Reads only zeros
8-0 D2	CSC Coefficient D2 value Two's complement coefficient integer offset to be added.

13.4.5.1.18 Channel Alpha Value Register for Region of Interest 0 (CHNL_ROI_0_ALPHA)

13.4.5.1.18.1 Offset

Register	Offset
CHNL_ROI_0_ALPHA	40h



13.4.5.1.18.2 Function

This register provides the alpha value and control to enable alpha value insertion into region of interest 0 of an image. The region is defined by the ROI_0_ULC and ROI_0_LRC registers. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions.

NOTE

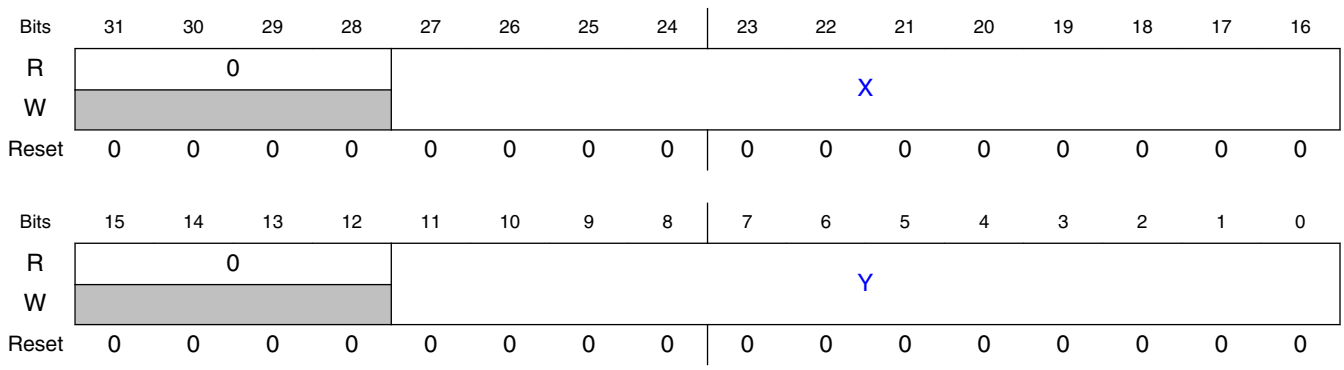
If one value of alpha is to be inserted globally for the whole image then use the IMG_CTRL register to provide the global alpha value and enable control. The ROI_* register will not be used.

13.4.5.1.18.3 Diagram

13.4.5.1.18.4 Fields

Field	Function
31-24 ALPHA	Alpha Value to be inserted with image Alpha value to be inserted into a region of interest of an image if ALPHA_EN is set to '1'. The region of interest is defined by the ROI_0_ULC and ROI_0_LRC regsiters.
23-17 RSVD0	Reserved field. Reads only zeros
16 ALPHA_EN	Alpha value insertion enable Controls whether alpha value is inserted or not into a region of interest of an image. The region of interest is defined by the ROI_0_ULC and ROI_0_LRC regsiters. 0b - Alpha value insertion is disabled 1b - Alpha value insertion is enabled
15-0 RSVD1	Reserved field. Reads only zeros

13.4.5.1.19 Channel Upper Left Coordinate Register for Region of Interest 0 (CHNL_ROI_0_ULC)



13.4.5.1.19.1 Offset

Register	Offset
CHNL_ROI_0_ULC	44h

13.4.5.1.19.2 Function

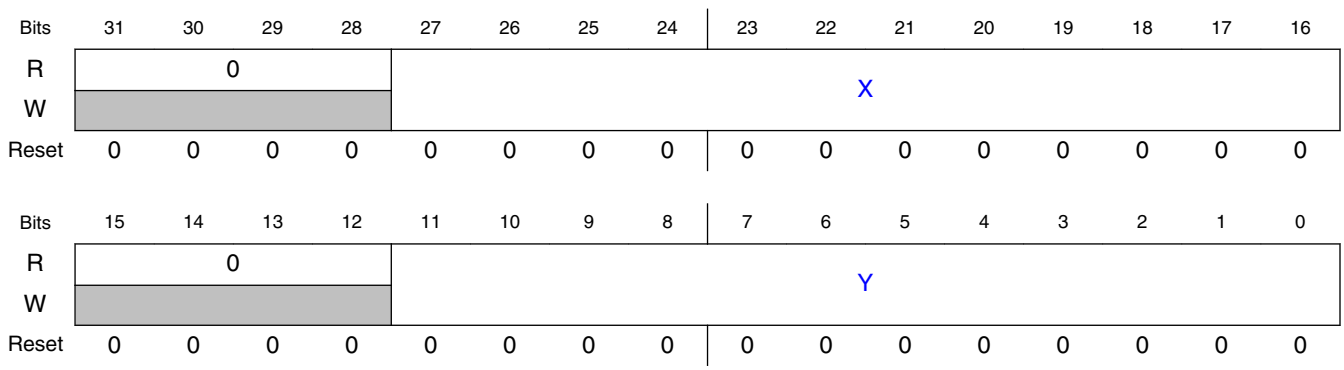
Defines the upper left coordinate for the region of interest 0. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions. Pixel locations that are greater than or equal to the upper left coordinates and less than or equal to the lower right coordinates define the region of interest.

13.4.5.1.19.3 Diagram

13.4.5.1.19.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Upper Left X-coordinate This field indicates the upper left X-coordinate (in pixels) of the region of interest 0.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Upper Left Y-coordinate This field indicates the upper left Y-coordinate (in pixels) of the region of interest 0.

13.4.5.1.20 Channel Lower Right Coordinate Register for Region of Interest 0 (CHNL_ROI_0_LRC)



13.4.5.1.20.1 Offset

Register	Offset
CHNL_ROI_0_LRC	48h

13.4.5.1.20.2 Function

Defines the lower right coordinate for the region of interest 0. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions. Pixel locations that are greater than or equal to the upper left coordinates and less than or equal to the lower right coordinates define the region of interest.

13.4.5.1.20.3 Diagram

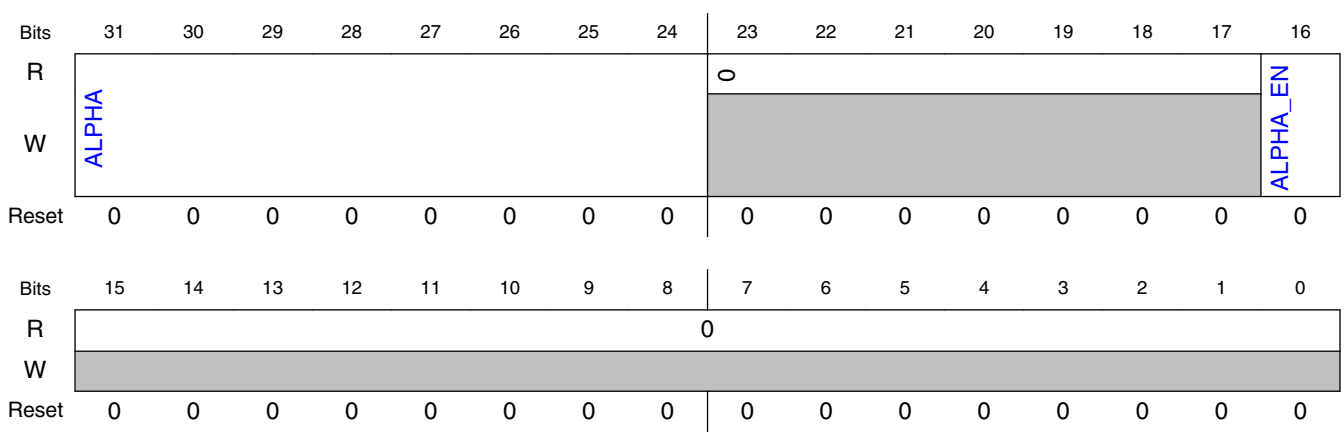
13.4.5.1.20.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Lower Right X-coordinate This field indicates the lower right X-coordinate (in pixels) of the region of interest 0.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Lower Right Y-coordinate This field indicates the lower right Y-coordinate (in pixels) of the region of interest 0.

13.4.5.1.21 Channel Alpha Value Register for Region of Interest 1 (CHNL_ROI_1_ALPHA)

13.4.5.1.21.1 Offset

Register	Offset
CHNL_ROI_1_ALPHA	4Ch



13.4.5.1.21.2 Function

This register provides the alpha value and control to enable alpha value insertion into region of interest 1 of an image. The region is defined by the ROI_1_ULC and ROI_1_LRC registers. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions.

NOTE

If one value of alpha is to be inserted globally for the whole image then use the IMG_CTRL register to provide the global alpha value and enable control. The ROI_* register will not be used.

13.4.5.1.21.3 Diagram

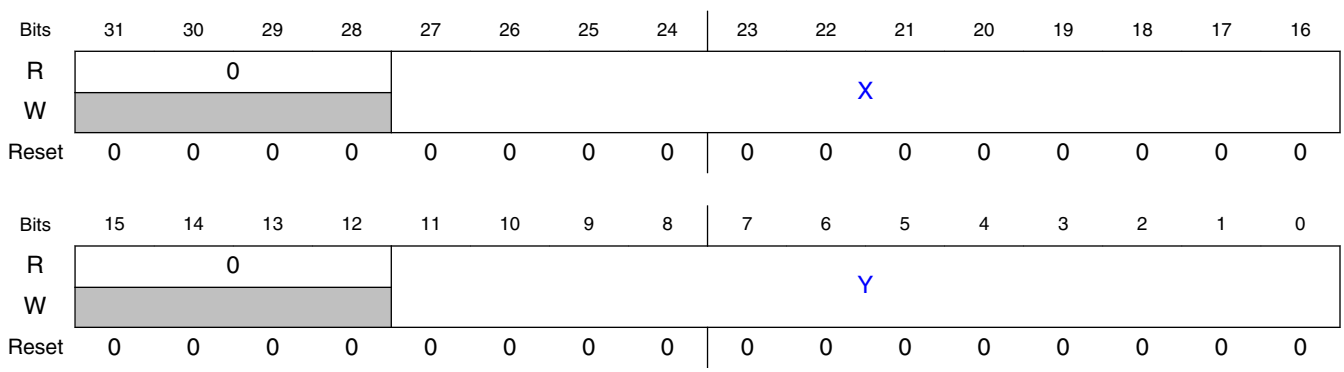
13.4.5.1.21.4 Fields

Field	Function
31-24 ALPHA	Alpha Value to be inserted with image

Table continues on the next page...

Field	Function
	Alpha value to be inserted into a region of interest of an image if ALPHA_EN is set to '1'. The region of interest is defined by the ROI_1_ULC and ROI_1_LRC regsiters.
23-17 RSVD0	Reserved field. Reads only zeros
16 ALPHA_EN	Alpha value insertion enable Controls whether alpha value is inserted or not into a region of interest of an image. The region of interest is defined by the ROI_1_ULC and ROI_1_LRC regsiters. 0b - Alpha value insertion is disabled 1b - Alpha value insertion is enabled
15-0 RSVD1	Reserved field. Reads only zeros

13.4.5.1.22 Channel Upper Left Coordinate Register for Region of Interest 1 (CHNL_ROI_1_ULC)



13.4.5.1.22.1 Offset

Register	Offset
CHNL_ROI_1_ULC	50h

13.4.5.1.22.2 Function

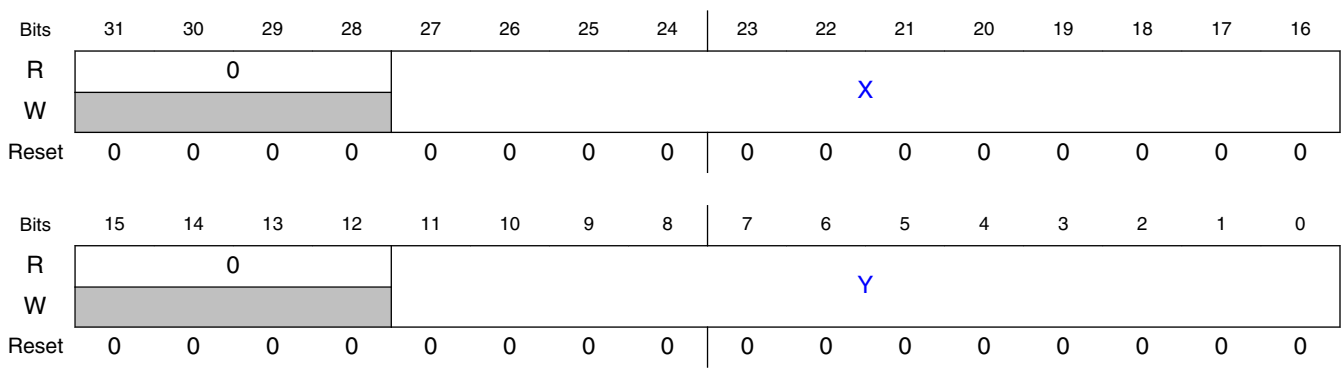
Defines the upper left coordinate for the region of interest 1. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions. Pixel locations that are greater than or equal to the upper left coordinates and less than or equal to the lower right coordinates define the region of interest.

13.4.5.1.22.3 Diagram

13.4.5.1.22.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Upper Left X-coordinate This field indicates the upper left X-coordinate (in pixels) of the region of interest 1.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Upper Left Y-coordinate This field indicates the upper left Y-coordinate (in pixels) of the region of interest 1.

13.4.5.1.23 Channel Lower Right Coordinate Register for Region of Interest 1 (CHNL_ROI_1_LRC)



13.4.5.1.23.1 Offset

Register	Offset
CHNL_ROI_1_LRC	54h

13.4.5.1.23.2 Function

Defines the lower right coordinate for the region of interest 1. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions. Pixel locations that are greater than or equal to the upper left coordinates and less than or equal to the lower right coordinates define the region of interest.

13.4.5.1.23.3 Diagram

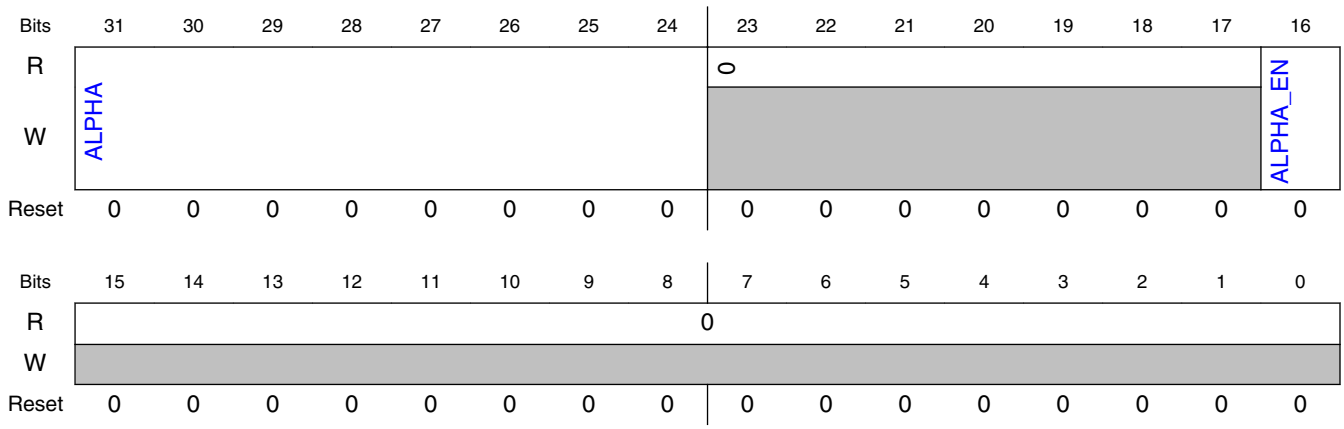
13.4.5.1.23.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Lower Right X-coordinate This field indicates the lower right X-coordinate (in pixels) of the region of interest 1.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Lower Right Y-coordinate This field indicates the lower right Y-coordinate (in pixels) of the region of interest 1.

13.4.5.1.24 Channel Alpha Value Register for Region of Interest 2 (CHNL_ROI_2_ALPHA)

13.4.5.1.24.1 Offset

Register	Offset
CHNL_ROI_2_ALPHA	58h



13.4.5.1.24.2 Function

This register provides the alpha value and control to enable alpha value insertion into region of interest 2 of an image. The region is defined by the ROI_2_ULC and ROI_2_LRC registers. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions.

NOTE

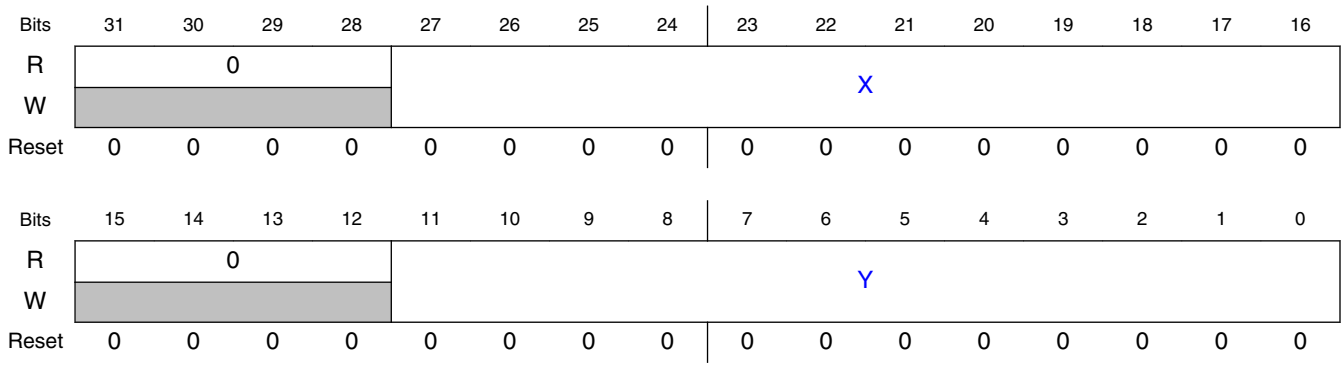
If one value of alpha is to be inserted globally for the whole image then use the IMG_CTRL register to provide the global alpha value and enable control. The ROI_* register will not be used.

13.4.5.1.24.3 Diagram

13.4.5.1.24.4 Fields

Field	Function
31-24 ALPHA	Alpha Value to be inserted with image Alpha value to be inserted into a region of interest of an image if ALPHA_EN is set to '1'. The region of interest is defined by the ROI_2_ULC and ROI_2_LRC regsiters.
23-17 RSVD0	Reserved field. Reads only zeros
16 ALPHA_EN	Alpha value insertion enable Controls whether alpha value is inserted or not into a region of interest of an image. The region of interest is defined by the ROI_2_ULC and ROI_2_LRC regsiters. 0b - Alpha value insertion is disabled 1b - Alpha value insertion is enabled
15-0 RSVD1	Reserved field. Reads only zeros

13.4.5.1.25 Channel Upper Left Coordinate Register for Region of Interest 2 (CHNL_ROI_2_ULC)



13.4.5.1.25.1 Offset

Register	Offset
CHNL_ROI_2_ULC	5Ch

13.4.5.1.25.2 Function

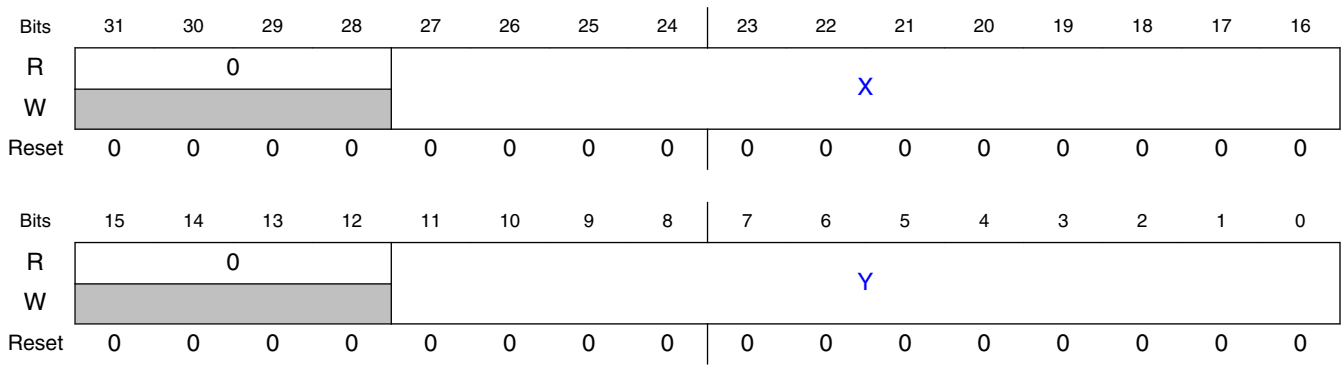
Defines the upper left coordinate for the region of interest 2. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions. Pixel locations that are greater than or equal to the upper left coordinates and less than or equal to the lower right coordinates define the region of interest.

13.4.5.1.25.3 Diagram

13.4.5.1.25.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Upper Left X-coordinate This field indicates the upper left X-coordinate (in pixels) of the region of interest 2.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Upper Left Y-coordinate This field indicates the upper left Y-coordinate (in pixels) of the region of interest 2.

13.4.5.1.26 Channel Lower Right Coordinate Register for Region of Interest 2 (CHNL_ROI_2_LRC)



13.4.5.1.26.1 Offset

Register	Offset
CHNL_ROI_2_LRC	60h

13.4.5.1.26.2 Function

Defines the lower right coordinate for the region of interest 2. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions. Pixel locations that are greater than or equal to the upper left coordinates and less than or equal to the lower right coordinates define the region of interest.

13.4.5.1.26.3 Diagram

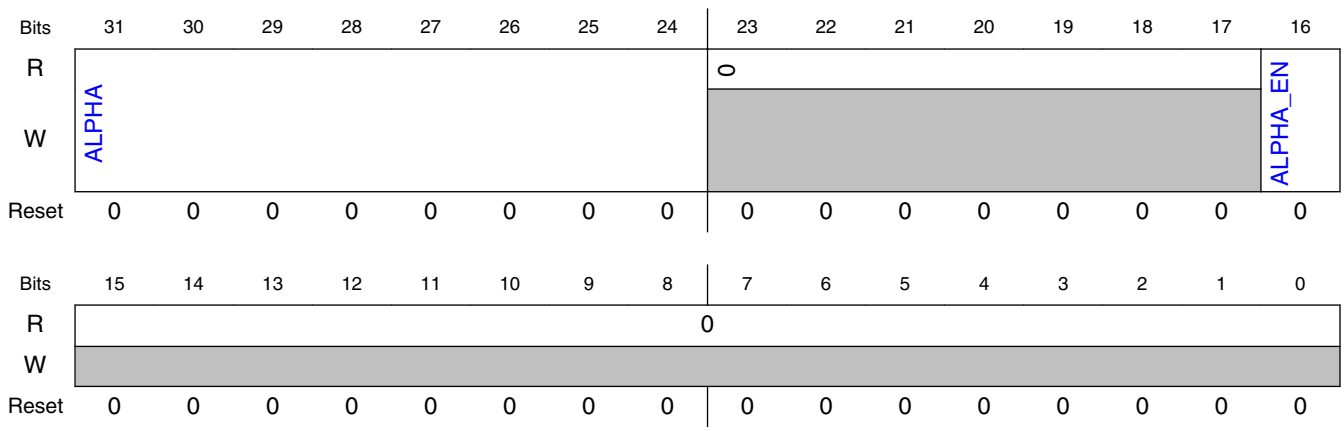
13.4.5.1.26.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Lower Right X-coordinate This field indicates the lower right X-coordinate (in pixels) of the region of interest 2.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Lower Right Y-coordinate This field indicates the lower right Y-coordinate (in pixels) of the region of interest 2.

13.4.5.1.27 Channel Alpha Value Register for Region of Interest 3 (CHNL_ROI_3_ALPHA)

13.4.5.1.27.1 Offset

Register	Offset
CHNL_ROI_3_ALPHA	64h



13.4.5.1.27.2 Function

This register provides the alpha value and control to enable alpha value insertion into region of interest 3 of an image. The region is defined by the ROI_3_ULC and ROI_3_LRC registers. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions.

NOTE

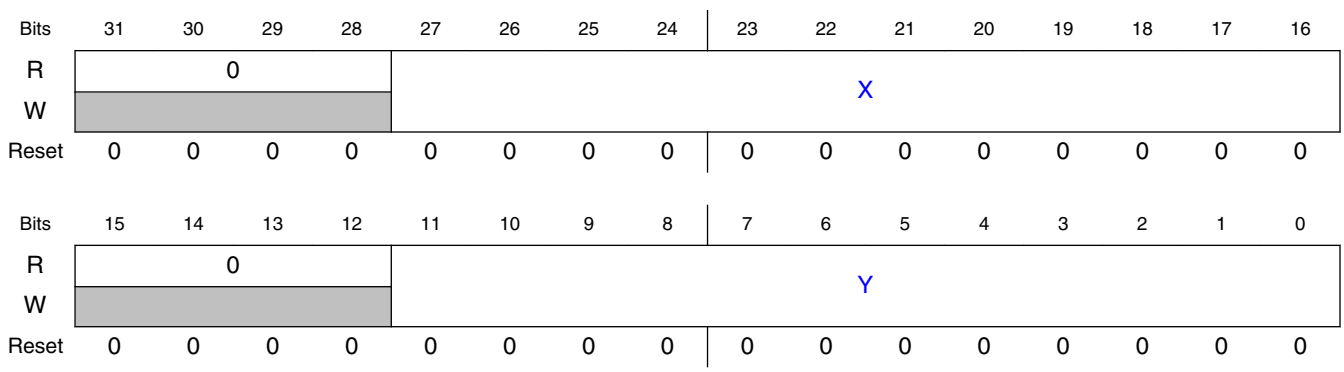
If one value of alpha is to be inserted globally for the whole image then use the IMG_CTRL register to provide the global alpha value and enable control. The ROI_* register will not be used.

13.4.5.1.27.3 Diagram

13.4.5.1.27.4 Fields

Field	Function
31-24 ALPHA	Alpha Value to be inserted with image Alpha value to be inserted into a region of interest of an image if ALPHA_EN is set to '1'. The region of interest is defined by the ROI_3_ULC and ROI_3_LRC regsiters.
23-17 RSVD0	Reserved field. Reads only zeros
16 ALPHA_EN	Alpha value insertion enable Controls whether alpha value is inserted or not into a region of interest of an image. The region of interest is defined by the ROI_3_ULC and ROI_3_LRC regsiters. 0b - Alpha value insertion is disabled 1b - Alpha value insertion is enabled
15-0 RSVD1	Reserved field. Reads only zeros

13.4.5.1.28 Channel Upper Left Coordinate Register for Region of Interest 3 (CHNL_ROI_3_ULC)



13.4.5.1.28.1 Offset

Register	Offset
CHNL_ROI_3_ULC	68h

13.4.5.1.28.2 Function

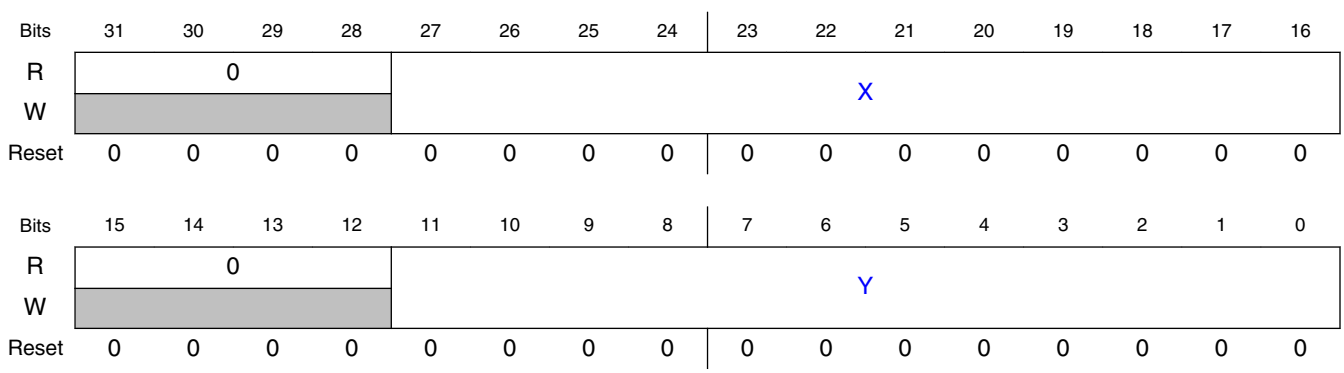
Defines the upper left coordinate for the region of interest 3. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions. Pixel locations that are greater than or equal to the upper left coordinates and less than or equal to the lower right coordinates define the region of interest.

13.4.5.1.28.3 Diagram

13.4.5.1.28.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Upper Left X-coordinate This field indicates the upper left X-coordinate (in pixels) of the region of interest 3.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Upper Left Y-coordinate This field indicates the upper left Y-coordinate (in pixels) of the region of interest 3.

13.4.5.1.29 Channel Lower Right Coordinate Register for Region of Interest 3 (CHNL_ROI_3_LRC)



13.4.5.1.29.1 Offset

Register	Offset
CHNL_ROI_3_LRC	6Ch

13.4.5.1.29.2 Function

Defines the lower right coordinate for the region of interest 3. The alpha insertion happens after scaling is done, so the ULC and LRC should correspond to the scaled image dimensions. Pixel locations that are greater than or equal to the upper left coordinates and less than or equal to the lower right coordinates define the region of interest.

13.4.5.1.29.3 Diagram

13.4.5.1.29.4 Fields

Field	Function
31-28 RSVD0	Reserved field. Reads only zeros
27-16 X	Lower Right X-coordinate This field indicates the lower right X-coordinate (in pixels) of the region of interest 3.
15-12 RSVD1	Reserved field. Reads only zeros
11-0 Y	Lower Right Y-coordinate This field indicates the lower right Y-coordinate (in pixels) of the region of interest 3.

13.4.5.1.30 Channel RGB or Luma (Y) Output Buffer 1 Address (CHNL_OUT_BUF1_ADDR_Y)

13.4.5.1.30.1 Offset

Register	Offset
CHNL_OUT_BUF1_ADDR_Y	70h

13.4.5.1.30.2 Function

Starting memory address of Buffer 1 where the RGB or Y (Luma) data of the processed image is stored.

13.4.5.1.30.3 Diagram

13.4.5.1.32.4 Fields

Field	Function
31-0 ADDR	Starting address for the V/Cr memory location

13.4.5.1.33 Channel Output Buffer Pitch (CHNL_OUT_BUF_PITCH)

13.4.5.1.33.1 Offset

Register	Offset
CHNL_OUT_BUF_PITCH	7Ch

13.4.5.1.33.2 Function

This register contains the output buffer pitch in bytes. Any byte value will indicate the vertical pitch. This value will be used in output pixel address calculations.

13.4.5.1.33.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

13.4.5.1.33.4 Fields

Field	Function
31-16 —	Reserved field. Reads only zeros.
15-0 LINE_PITCH	Output Buffer Line Pitch Indicates the number of bytes in memory between two vertically adjacent pixels.

13.4.5.1.34 Channel Input Buffer Address (CHNL_IN_BUF_ADDR)

13.4.5.1.34.1 Offset

Register	Offset
CHNL_IN_BUF_ADDR	80h

13.4.5.1.34.2 Function

This reigster provides the start address for reading in stand-alone or deinterlace image frames from memory. Blending (or Averaging) deinterlacing stores the odd frame image into memory address specified by this register. The channel with SRC set as Memory reads back the image and sends it to the deinterlacing logic.

The storage location allows for two frames to be stored. When reading in image frames from memory, the module will switch between the two locations automatically. The read operation starts automatically when blend deinterlacing is to be done. When processing stand-alone images from memory, software must trigger the processing of images. The

format of image that can be stored in this location can be RGB, YUV444 or YUV422 only. The image format is set automatically when one channel is configured to perform Blend deintrlacing.

For deinterlacing, the software just needs to configure the deinterlace method and source type in one channel and configure only the source type as memory in another channel. The module can pair the deinterlace and memory channels automatically to perform Blend Deinteralce. For other deinterlace methods, read back of frames from memory is not required. More details on Deinterlacing in Functional Description chapter.

13.4.5.1.34.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	ADDR															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.4.5.1.34.4 Fields

Field	Function
31-0 ADDR	Starting Address from where the input image is read in from. Software can update the IN_BUF_ADDR during direct memory reads. For de-interlacing, it is mandatory for the software to reserve two frame size + pitch range of addresses for the intermediate frames. The hardware logic will determine the addresses for the intermediate frames during deinterlacing as the intermediate frames are of no concern to software.

13.4.5.1.35 Channel Input Buffer Pitch (CHNL_IN_BUF_PITCH)

13.4.5.1.35.1 Offset

Register	Offset
CHNL_IN_BUF_PITCH	84h

13.4.5.1.35.2 Function

This register provides the line and frame pitch for the image to be read out from memory location set in the IN_BUF_ADDR register.

13.4.5.1.35.3 Diagram

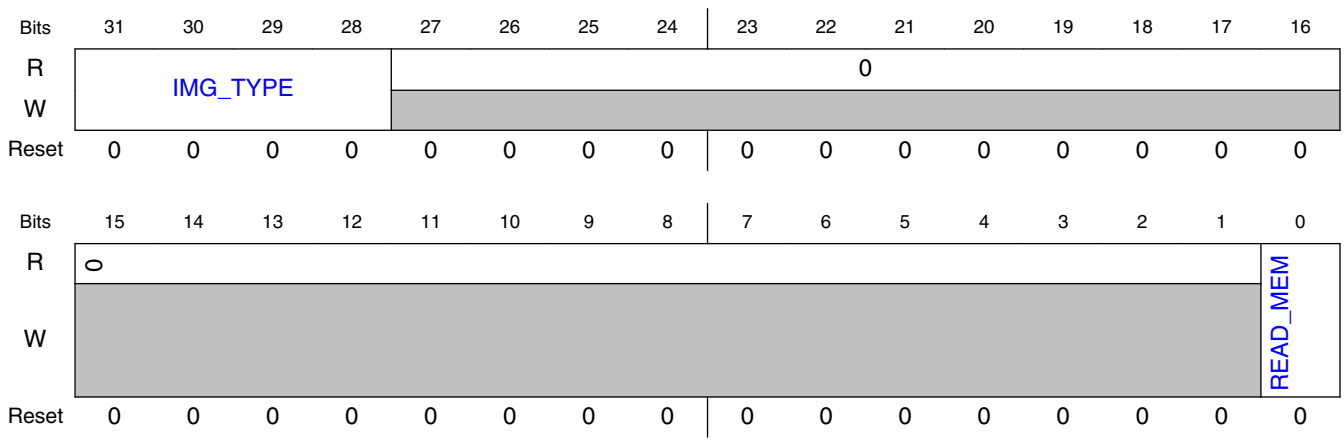
Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	FRM_PITCH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	LINE_PITCH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.4.5.1.35.4 Fields

Field	Function
31-16 FRM_PITCH	Frame Pitch Indicates the number of bytes in memory between two frames being read in from memory. Software can alternatively keep the frame pitch as zero and update the IN_BUF_ADDR during direct memory reads. For de-interlacing, the frame pitch is required to store the intermediate frames. Since the intermediate frames are of no concern to software, it is mandatory for the software to reserve two frame size + pitch range of addresses for the intermediate frames.
15-0 LINE_PITCH	Line Pitch Indicates the number of bytes in memory between two vertically adjacent pixels.

13.4.5.1.36 Channel Memory Read Control (CHNL_MEM_RD_CTRL)



13.4.5.1.36.1 Offset

Register	Offset
CHNL_MEM_RD_CTRL	88h

13.4.5.1.36.2 Function

When the image source type (CTRL[SRC_TYPE])is memory and stand alone image is being read from memory (no deitnerlacing being done), this register also provides the image format information and control to start reading image from memory. This register is not used during deinterlacing where image read back from memory is controlled by deinterlace logic. Both deinterlace image read and standalone image read cannot happen together, even on different channels.

13.4.5.1.36.3 Diagram

13.4.5.1.36.4 Fields

Field	Function
31-28 IMG_TYPE	Input image format When an image is being read from memory (even during deitnerlacing), this field specifies the format of the image. 0000b - BGR8P - BGR format with 8-bits per color component (packed into 32-bit DWORD) 0001b - RGB8P - RGB format with 8-bits per color component (packed into 32-bit DWORD) 0010b - XRGB8 - RGB format with 8-bits per color component (unpacked and LSB aligned in 32-bit DWORD) 0011b - RGBX8 - RGB format with 8-bits per color component (unpacked and MSBalinged in 32-bit DWORD) 0100b - XBGR8 - BGR format with 8-bits per color component (unpacked and LSB aligned in 32-bit DWORD) 0101b - RGB565 - RGB format with 5-bits of R, B; 6-bits of G (packed into 32-bit DWORD) 0110b - A2BGR10 - BGR format with 2-bits alpha in MSB; 10-bits per color component 0111b - A2RGB10 - RGB format with 2-bits alpha in MSB; 10-bits per color component 1000b - YUV444_1P8P with 8-bits per color component; 1-plane, YUV interleaved packed bytes 1001b - YUV444_1P10 with 10-bits per color component; 1-plane, YUV interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 1010b - YUV444_1P10P with 10-bits per color component; 1-plane, YUV interleaved packed bytes (2 MSBs waste bits in 32-bit WORD) 1011b - YUV444_1P12 with 12-bits per color component; 1-plane, YUV interleaved unpacked bytes (4 LSBs waste bits in 16-bit WORD)

Table continues on the next page...

Field	Function
	1100b - YUV444_1P8 with 8-bits per color component; 1-plane YUV interleaved unpacked bytes (8 MSBs waste bits in 32-bit DWORD) 1101b - YUV422_1P8P with 8-bits per color component; 1-plane YUV interleaved packed bytes 1110b - YUV422_1P10 with 10-bits per color component; 1-plane, YUV interleaved unpacked bytes (6 LSBs waste bits in 16-bit WORD) 1111b - YUV422_1P12 with 12-bits per color component; 1-plane, YUV interleaved packed bytes (4 MSBs waste bits in 16-bit WORD)
27-1 RSVD0	Reserved field. Reads only zeros
0 READ_MEM	Initiate read from memory Setting this bit to 1 will initiate direct read of image from memory. One one full image frame will be read. To read another image frame from memory, this bit must be set to '0' and then to '1'. Bit can be set to '0' after setting to '1' while read from memory is in progress; this will not stop the read operation. Read will stop when one full frame is read. This bit is not used during deinterlacing. 0b - No reads from memory done 1b - Reads from memory initiated

13.4.5.1.37 Channel RGB or Luma (Y) Output Buffer 2 Address (CHNL_OUT_BUF2_ADDR_Y)

13.4.5.1.37.1 Offset

Register	Offset
CHNL_OUT_BUF2_ADDR_Y	8Ch

13.4.5.1.37.2 Function

Starting memory address of Buffer 2 where the RGB or Y (Luma) data of the processed image is stored.

13.4.5.1.39.4 Fields

Field	Function
31-0 ADDR	Starting address for the V/Cr memory location

13.4.5.1.40 Channel Scaled Image Configuration (CHNL_SCL_IMG_CFG)

13.4.5.1.40.1 Offset

Register	Offset
CHNL_SCL_IMG_CFG	98h

13.4.5.1.40.2 Function

This register provides the details about the image width (pixels) and height (lines) at the output of scaler. Since the image after scaling can be flipped and/or cropped, the dimension of image after scaling becomes an important parameter for the output buffer control logic.

The scaled image dimension is computed as Dimension in CHNL_IMG_CFG register divided by the scale factor in CHNL_SCALE_FACTOR and rounded to the closest integer.

NOTE

Even is scaler is bypassed, this register must be programmed with the correct image dimensions.

13.4.5.1.40.3 Diagram

Reset	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0

13.4.5.1.40.4 Fields

Field	Function
31-29 RSVD1	Reserved field. Reads only zeros.
28-16 HEIGHT	Scaled image height (lines) This field provides the height of scaled image in terms of number of lines. Default height is 1080 lines for 1:1 scaling.

Table continues on the next page...

Field	Function
15-13 RSVD0	Reserved field. Reads only zeros.
12-0 WIDTH	Scaled image width (pixels) This field provides the width of the scaled image in terms of number of pixels. Default width is 1920 pixels for 1:1 scaling.

13.4.5.1.41 Channel Flow Control Register (CHNL_FLOW_CTRL)

13.4.5.1.41.1 Offset

Register	Offset
CHNL_FLOW_CTRL	9Ch

13.4.5.1.41.2 Function

This register provides the amount of usable AXI bus bandwidth for writing out the pixel data from the channel's output buffers (Y or U or V). The usable bandwidth is specified as a fraction (i.e. numerator/denominator) where denominator >= numerator. This flow control kicks in for the whole frame when the source of frame is memory or for only the last line when source is a pixel link input and line buffer inside the scaler is being used (i.e. when scaler is enabled or YUV420 data is being input).

13.4.5.1.41.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

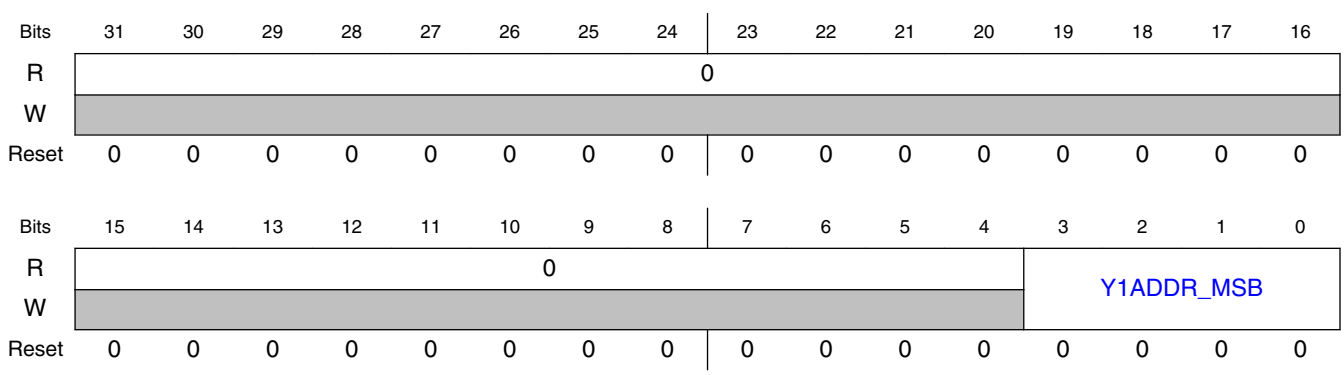
13.4.5.1.41.4 Fields

Field	Function
31-24	Reserved

Table continues on the next page...

Field	Function
—	
23-16 FC_NUMER	Numertor value of fraction of usable bandwidth This value determines the clock cycles out of FC_DENOM number of clock cycles during which pixels can be written out. FC_NUMER cannot be be greater than FC_DENOM. Setting this field to 0 will disable flow control. Setting FC_NUMER = FC_DENOM will allow the AXI write request to consume full bandwidth available. 00000000b - Flow control is disabled.
15-8 —	Reserved
7-0 FC_DENOM	Denominator value of fraction of usable bandwidth This value determines the total cycles within which FC_NUMER clock cycles will be used to write out the data on the AXI write bus. FC_DENOM cannot be less than FC_NUMER. Setting this field to 0 will disable flow control. Setting FC_NUMER = FC_DENOM will allow the AXI write request to consume full bandwidth available. 00000000b - Invalid value. Flow control will be disabled.

13.4.5.1.42 Channel Output Y-Buffer 1 Extended Address Bits Register (CHNL_Y_BUF1_XTND_ADDR)



13.4.5.1.42.1 Offset

Register	Offset
CHNL_Y_BUF1_XTND_ADDR	A0h

13.4.5.1.42.2 Function

This register provides additional MSB bits to address more than 32-bits of address space on the AXI bus.

Field	Function
31-4 —	Reserved bits. Reads only zeros.
3-0 XADDR_MSB	Extended Address Most Significant Bits Extended MSB bits that will be combined with CHNL_IN_BUF_ADDR[ADDR] to form an address that is more than 32-bits wide on the AXI bus.

13.5 MIPI CSI Host Controller (MIPI_CSI)

13.5.1 Overview

MIPI Camera Serial Interface (MIPI_CSI2) is the camera interface for this chip. It works with MIPI DPHY module to connect to the host processor.

MIPI_CSI2 supports RAW, YUV and RGB image formats when used in conjunction with output to ISI (Image Sensing Interface) or ISP (Image Signal Processing). '

13.5.1.1 Block Diagram

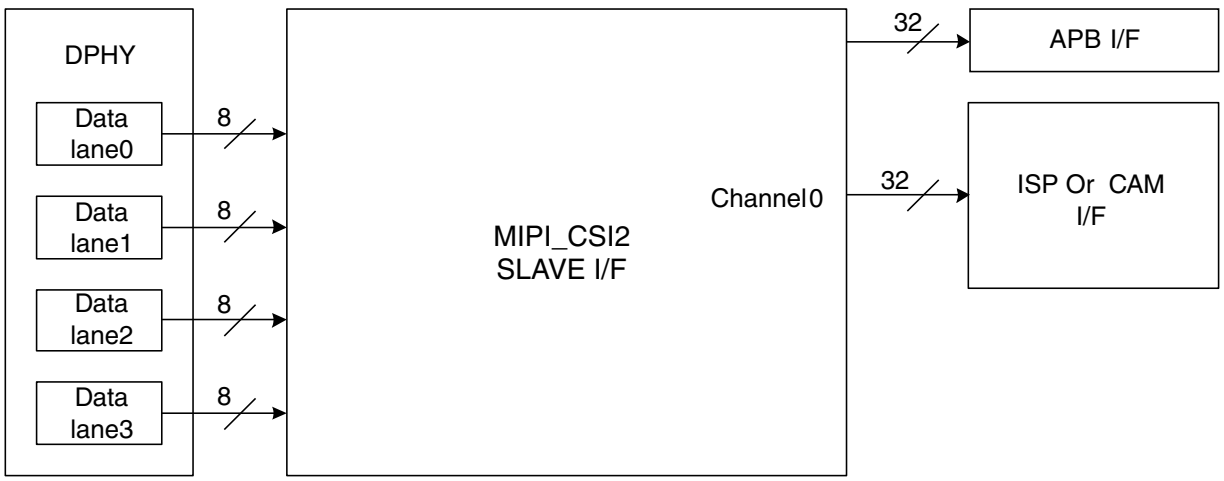

Figure 13-12. Block diagram of camera system with MIPI CSI Slave Interface

13.5.1.2 Features

- Compliant to MIPI D-PHY specification V1.2
- Compliant to MIPI CSI2 Specification V1.3 except for C-PHY feature
- Support primary and secondary Image format
  - YUV420, YUV420 (Legacy), YUV420 (CSPS), YUV422 of 8-bits and 10-bits
  - RGB565, RGB666, RGB888
  - RAW6, RAW7, RAW8, RAW10, RAW12, RAW14
- Support up to 4 lanes of D-PHY
- Interfaces
  - Compatible to PPI(Protocol-to-PHY Interface) in MIPI D-PHY Specification
  - AMBA3.0 APB Slave for Register configuration.
  - Image output data buswidth : 32 bits
  - Supports data interleave
- Image memory
  - Size of SRAM is 4KB
- Pixel clock can be gated when no ppi data is coming.

13.5.2 Functional Description

13.5.2.1 MIPI CSI Slave and D-PHY I/F block diagram

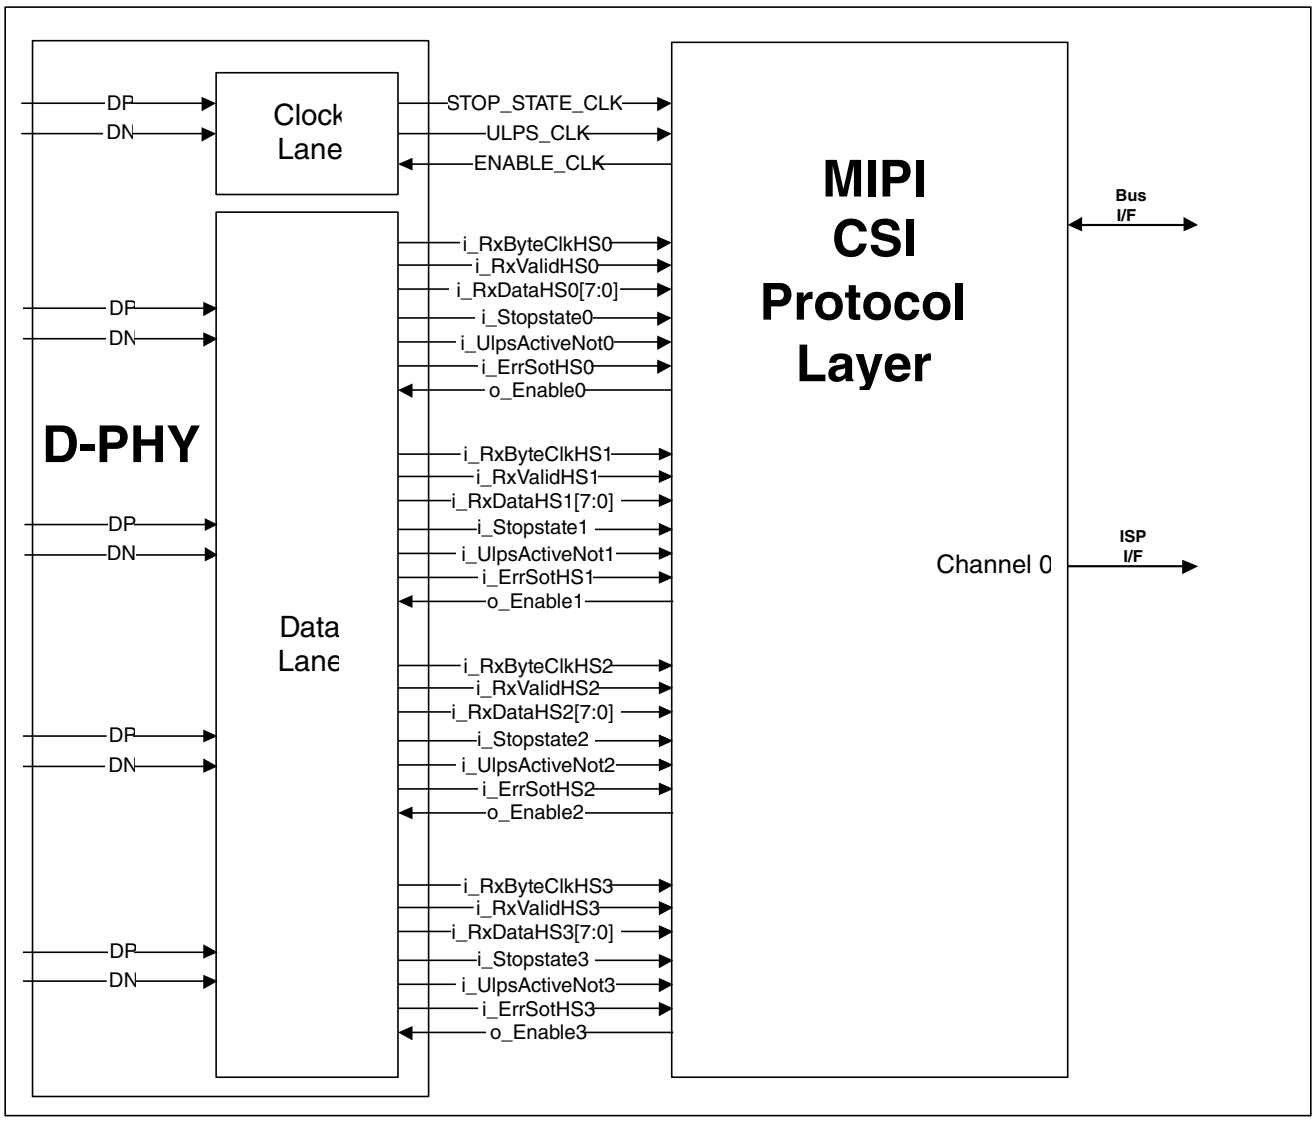

Figure 13-13. PPI I/F block diagram

13.5.2.2 Memory Bridge

The following table describes the configurable-sized memories.

Table 13-4. Memory bridge list

Usage	Memory Type	Size	Description
Image Data	2 port SRAM	4KB (1024 x 32bits)	Store the image data

There is the timing diagram for read memory in the figure below. If the mux for the split memories is needed, register for storing the address is necessary. Because the RDATA of memory is prepared at 1 clock later when the REN and RADDR are accepted.

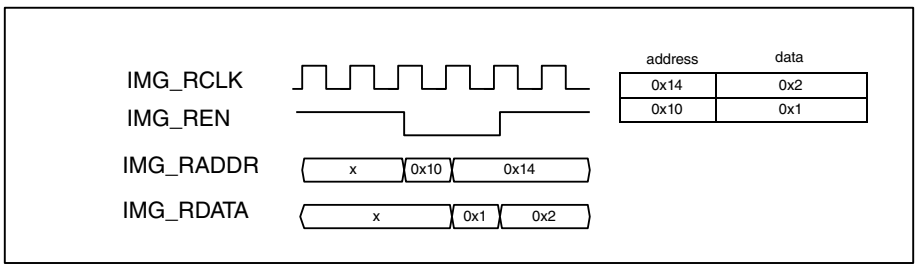

Figure 13-14. Timing diagram of Read memory

13.5.2.3 Protocol

13.5.2.3.1 D-PHY layer FSM

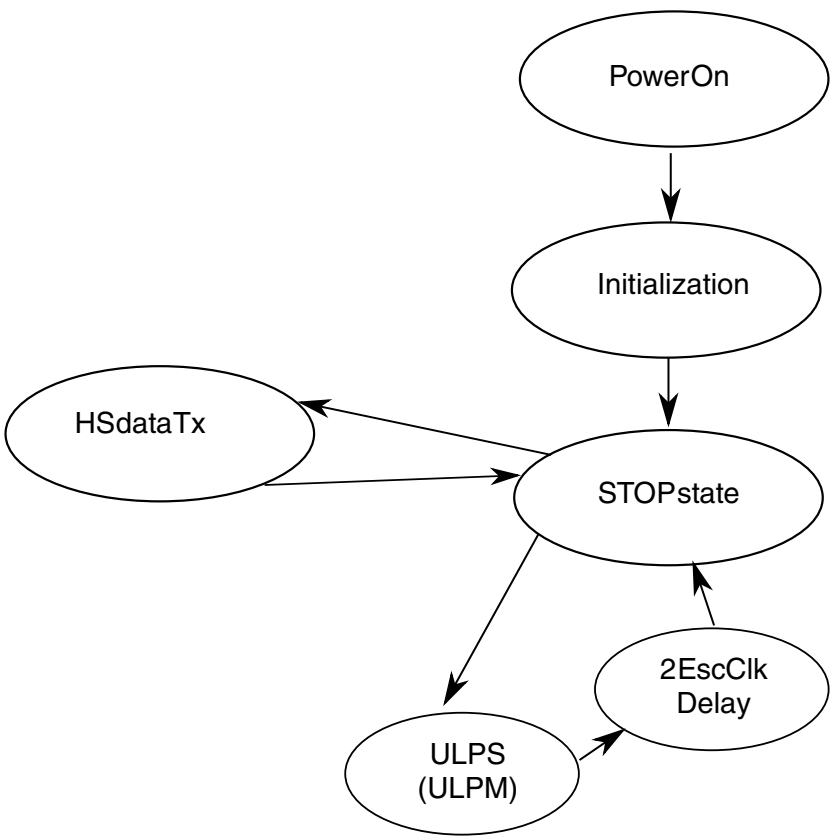

Figure 13-15. D-PHY Finite State Machine (FSM)

CSIS V3.6.3 system supports HSDT(High Speed Data transfer) and ULPS(ULPM – Utra-Low Power State or Mode) only. There is no trigger function, Low Power Data Transmission (LPDT) and Bus Turn Around (BTA).

13.5.2.3.2 High Speed Data Transfer

In the following figure, the upper 5 signals are related with clock lane and the lower 6 signals are related with data lane. Dp and Dn of upper signals are D-PHY channel of clock lane. BYTE_CLK is generated clock in the D-PHY. Dp and Dn of lower signals are Data lane. Another signals of lower are Phy Status signals. STOPstate (and STOPstateClk) indicates that differential channel state of D-PHY is LP11 (the voltage level of Dp and Dn is 1.2V)

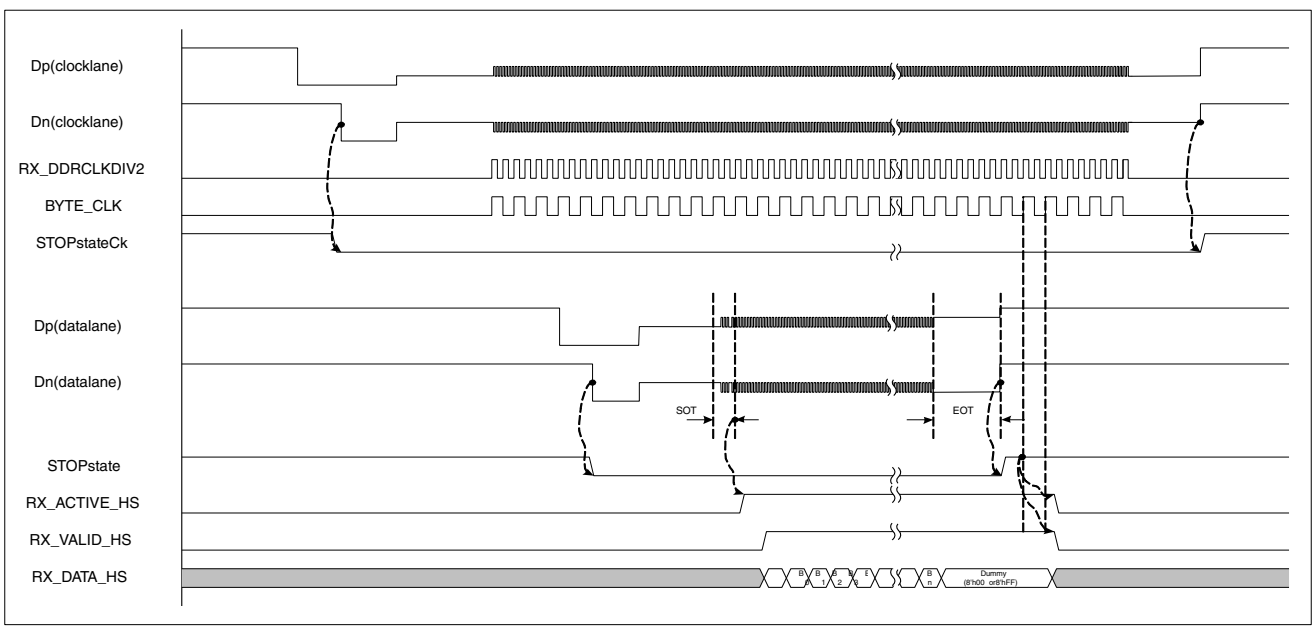

Figure 13-16. Timing Diagram of High Speed Data Transfer

13.5.2.3.3 Ultra-Low Power Mode

In the following figure, UlpsActiveNot* and STOPstate* is in PPI. ULPS command generated by D-PHY Tx is only for D-PHY Rx and it is decoded by D-PHY Rx and transferred to Link with Ulps data.

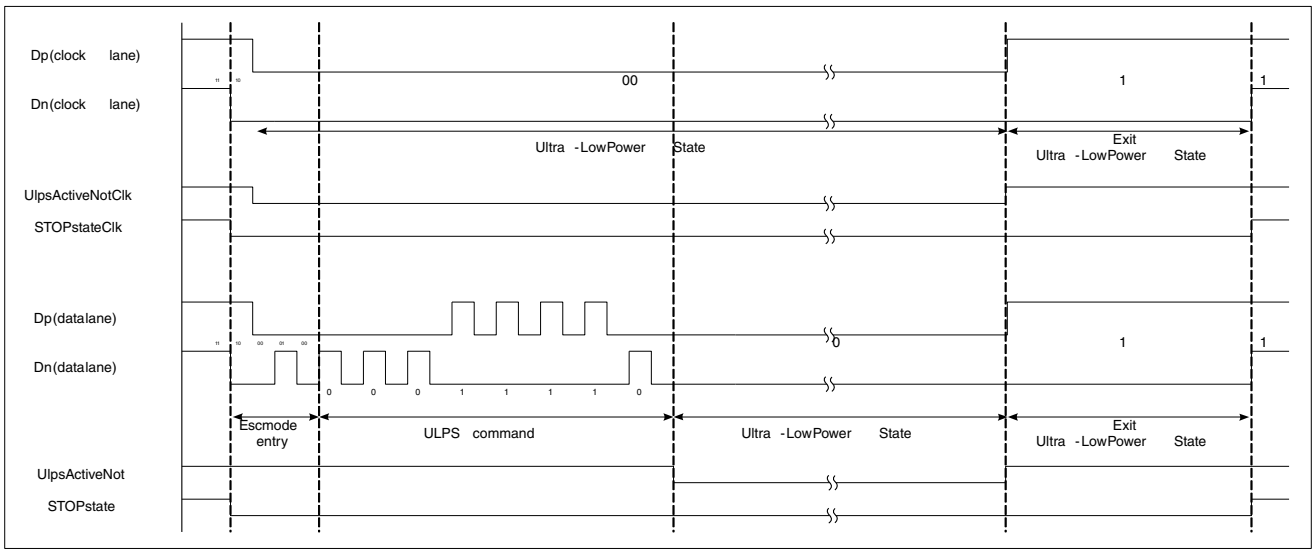

Figure 13-17. Timing Diagram of Ultra Low Power Mode

13.5.2.4 Interfaces

13.5.2.4.1 PPI Interface

Table 13-5. PPI I/F pin description

Port Name	I/O	Sync	Description
ENABLE_CLK	O	Async level	Enable clock lane module
STOP_STATE_CLK	I	Async level	Lanes in stop_state
ULPS_CLK	I	Async level	Clock lane is in Ultra Low-Power State (ULPS)
i_RxByteClkHS%	I	-	Rx byte clock in HS mode
i_RxValidHS%	I	Sync RX_BYTE_CLK_HS%	High-Speed receive data valid
i_RxDataHS%	I	Sync RX_BYTE_CLK_HS%	High-Speed receive data
i_ErrSotHS%	I	Sync RX_BYTE_CLK_HS%	Start of Transmission error (Pulse high)
o_Enable%	O	Async level	Enable Data lane module
i_Stopstate%	I	Async level	Lanes in stop_state
i_UlpsActiveNot%	I	Async level	Data Lane is in Ultra Low-Power State (ULPS)

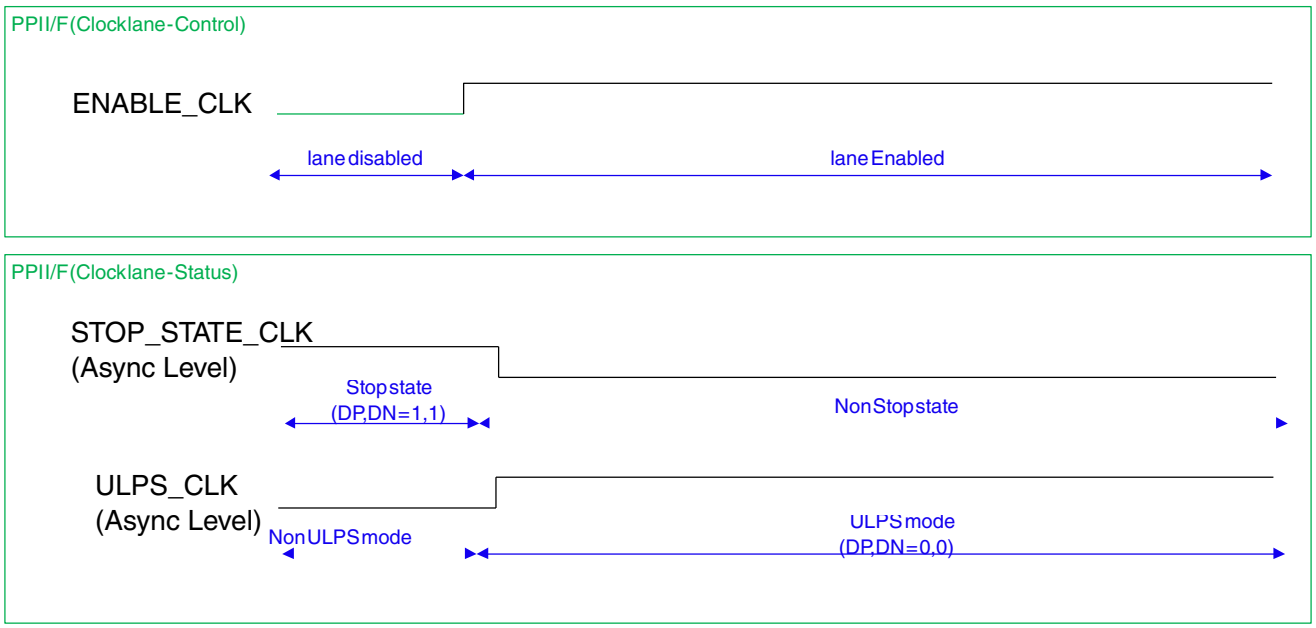

Figure 13-18. PPI I/F (Clock lane) timing diagram

NOTE

DPHY should supply i_RxByteClkHS% at least 15 clock period after falling i_RxValidHS%

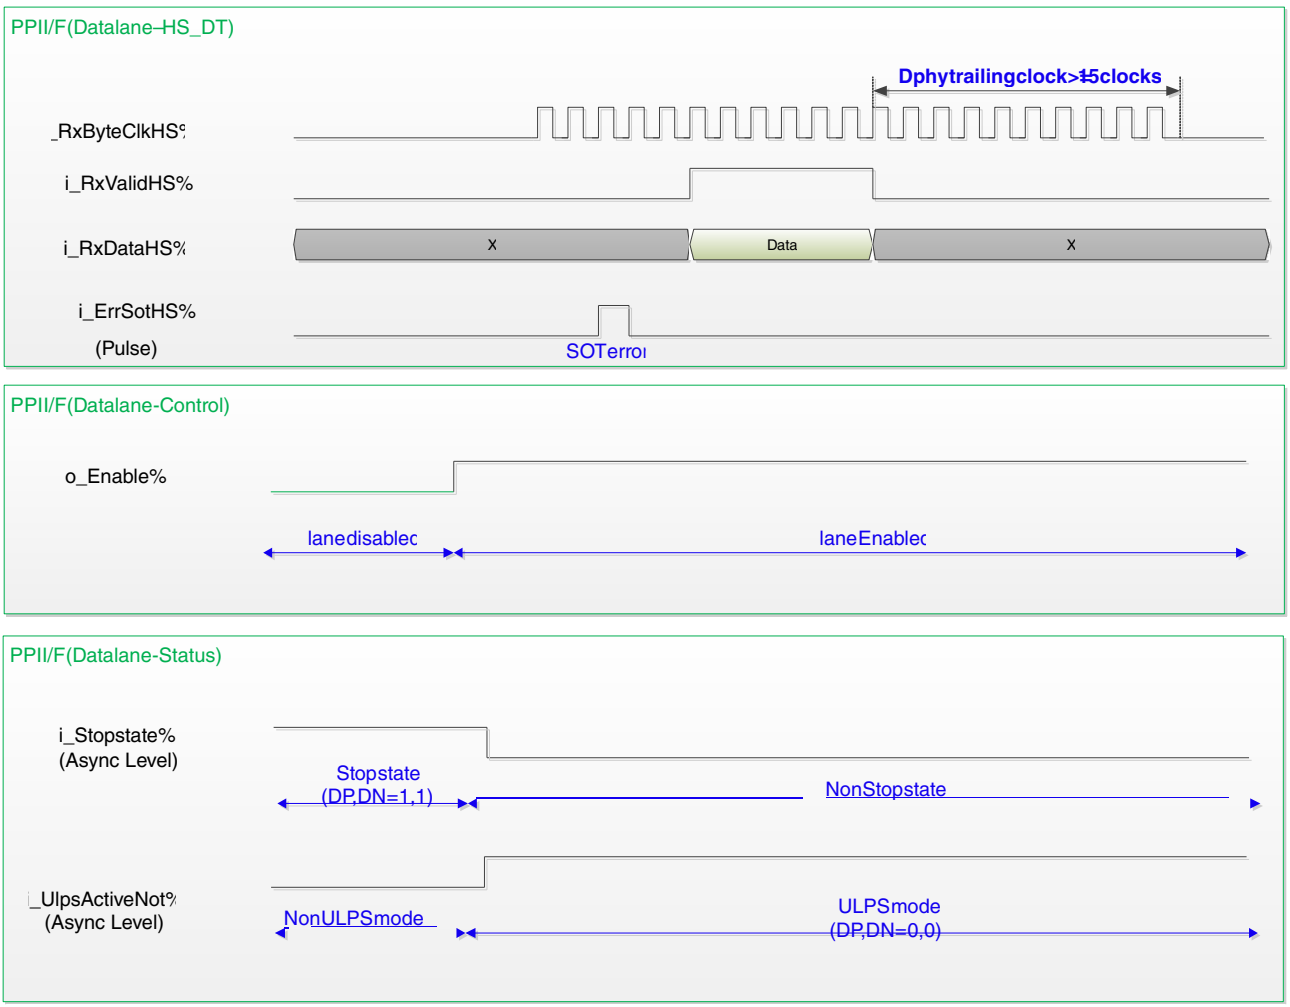

Figure 13-19. PPI I/F (Data lane) timing diagram

13.5.2.4.2 ISP Interface

CSIS V3.6.3 has output signals which are PIX_CLK, VVALID, HVALID, BVALID, and DATA.

Table 13-6. ISP I/F pin description

Port Name	I/O	Sync	Description
O_PIXCLK	O	-	Pixel clock. This signal is generated from I_ACLK.
O_VVALID	O	O_PIX_CLK	Vertical sync signal. This signal is set during whole frame.
O_HVALID	O	O_PIX_CLK	Horizontal sync signal.

Table continues on the next page...

Table 13-6. ISP I/F pin description (continued)

Port Name	I/O	Sync	Description
			This signal is set during each line.
O_BVALID	O	O_PIX_CLK	Byte valid signal.
O_DATA	O	O_PIX_CLK	Pixel data bus. The pixel is aligned based on its data type.

The following figure describes the timing diagram of ISP I/F. All signals are synchronized with the rising edge of PIXCLK.

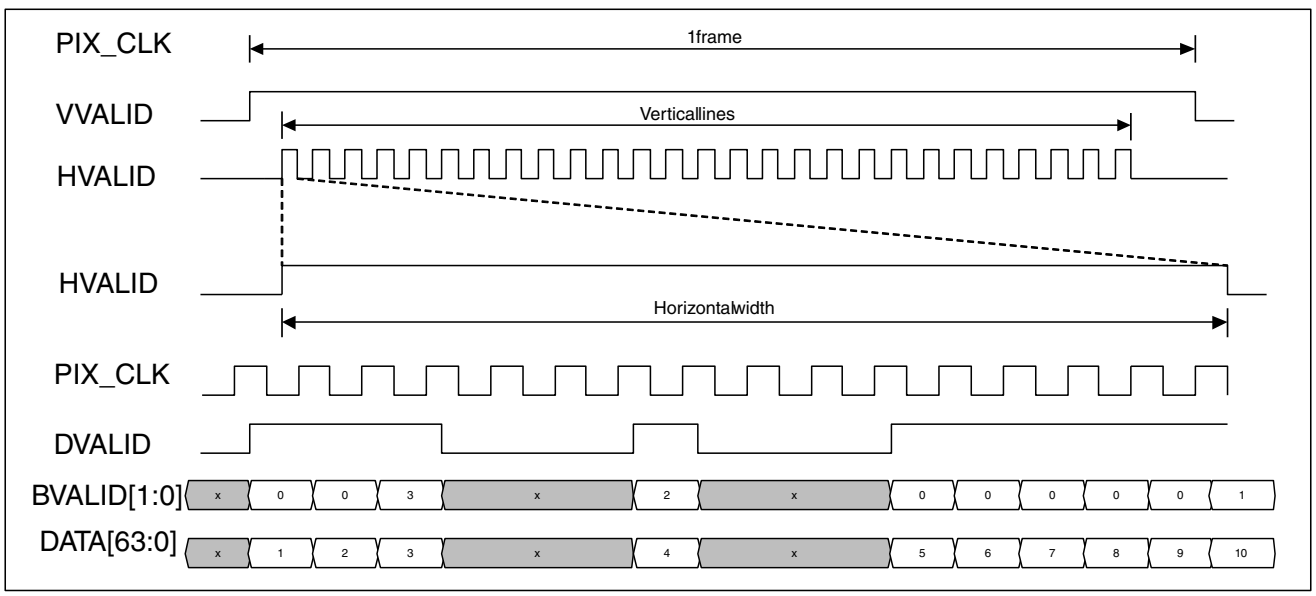

Figure 13-20. Output protocol of ISP Wrapper of CSIS C3.6.3

The following figure describes the sync timing of frame.

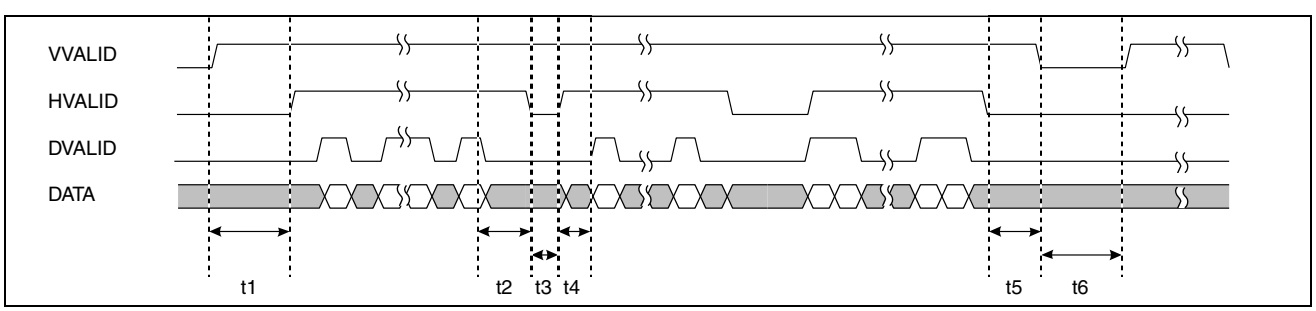

Figure 13-21. Frame sync timing diagram

The elements in the following table control the interval in Figure 13-21. Those elements are configurable by register in ISP SYNC register of CH0.

Table 13-7. Frame sync timing description

	Description	Minimum cycle (# PIX_CLK)	Maximum cycle (# PIX_CLK)
t1	Interval between rising of VVALID and first rising HVALID	1	-
t2	Interval between last falling of DVALID and falling HVALID	Hsync_Lintv + 1	-
t3	Interval between falling of HVALID and rising of next HVALID	1	-
t4	Interval between rising of HVALID and first rising of DVALID	0	-
t5	Interval between last falling of HVALID and falling of VVALID	1	-
t6	Interval between falling of VVALID and rising of next VVALID	1	-

13.5.2.4.3 SRAM Interface

MIPI CSI2 has output signals which are PIX_CLK, VVALID, HVALID, BVALID, and DATA.

Table 13-8. SRAM interface description

Port Name	I/O	Sync	Description
O_IMG_MEM_WCLK	O	-	Write clock for the SRAM of IMG_MEM
O_IMG_MEM_WEN	O	O_IMG_MEM_WCLK	Write enable for the SRAM of IMG_MEM (active low)
O_IMG_MEM_WADDR	O	O_IMG_MEM_WCLK	Write address for the SRAM of IMG_MEM
O_IMG_MEM_WDATA	O	O_IMG_MEM_WCLK	Write data for the SRAM of IMG_MEM
O_IMG_MEM_RCLK	O	O_IMG_MEM_WCLK	Read clock for the SRAM of IMG_MEM
O_IMG_MEM_REN	O	O_IMG_MEM_RCLK	Read enable for the SRAM of IMG_MEM (active low)
O_IMG_MEM_RADDR	O	O_IMG_MEM_RCLK	Read address for the SRAM of IMG_MEM
O_IMG_MEM_RDATA	I	O_IMG_MEM_RCLK	Read data from the SRAM of IMG_MEM

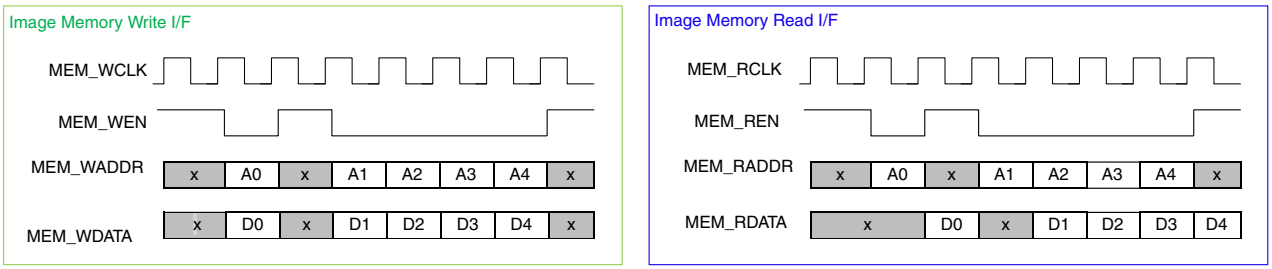

Figure 13-22. SRAM interface timing diagram

13.5.2.5 Image Data alignment

13.5.2.5.1 Normal Data alignment

The following figure describes the present of each bit in the data bus of ISP I/F.

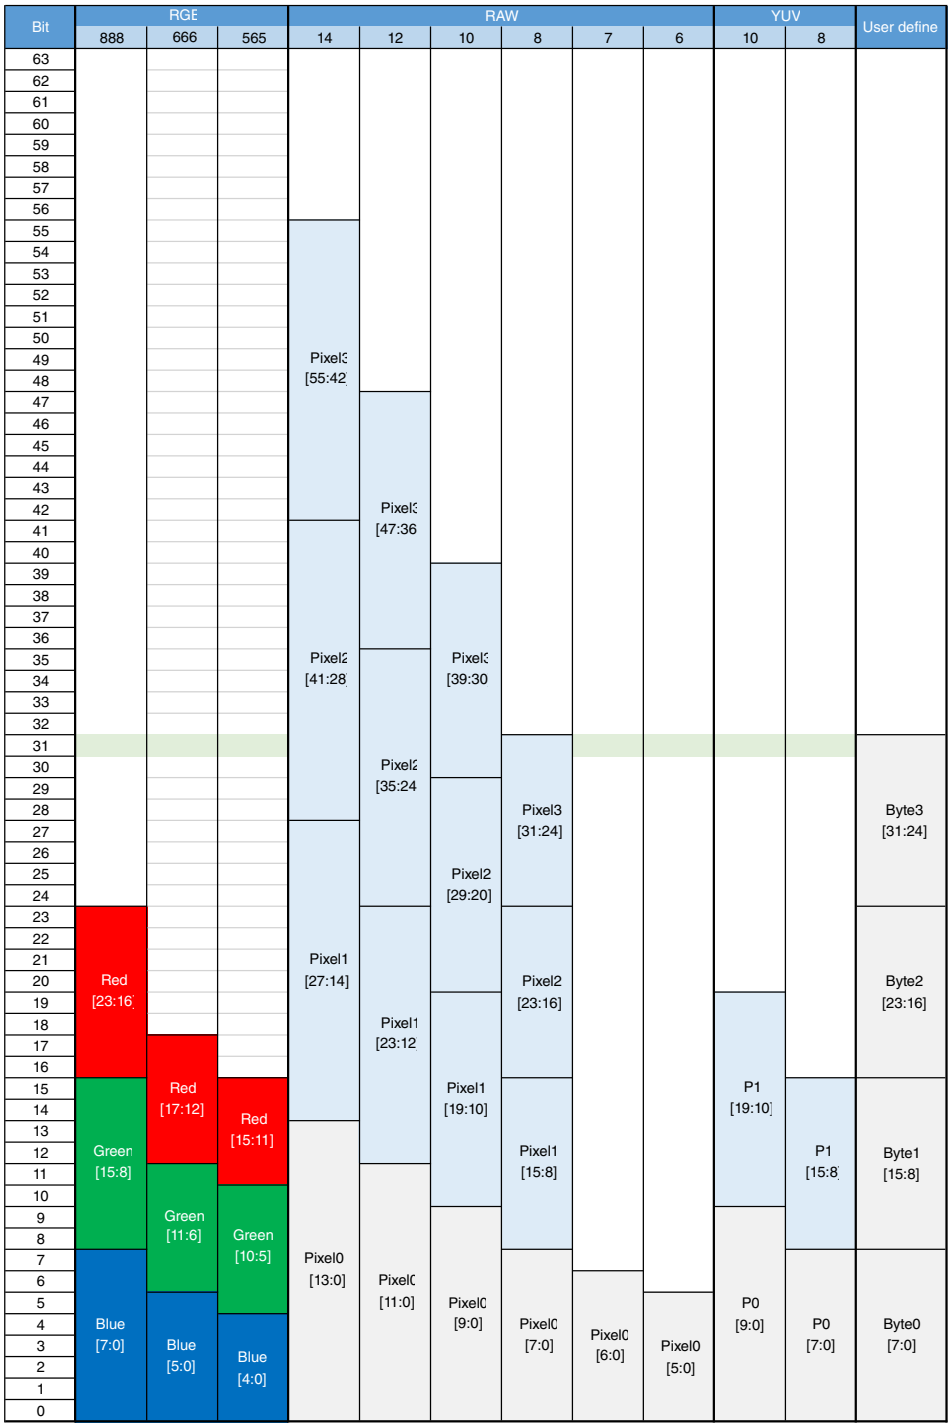

Figure 13-23. Pixel alignment

Pixel IF is adopted the little endian. If the current pixel mode is single, Pixel0 is a valid pixel. Higher pixels are the invalid signals. If the current pixel mode is dual, pixel0 and pixel1 is the valid pixels. In the case of Quad pixel mode, pixel0, pixel1, pixel2 and pixel3 is the valid pixels.

13.5.2.5.2 YUV data stream

Table 13-9. Output Image Stream of YUV formats

YUV format	Line	Image stream of content
YUV420 legacy	Odd	U1 Y1 Y2 U3 Y3 Y4 U5 Y5 ...
	Even	V1 Y1 Y2 V3 Y3 Y4 V5 Y5 ...
YUV420	Odd	Y1 Y2 Y3 Y4 Y5 Y6 Y7 Y8 ...
	Even	U1 Y1 V1 Y2 U3 Y3 V3 Y4 ...
YUV422	Odd/Even	U1 Y1 V1 Y2 U3 Y3 V3 Y4 ...

13.5.2.5.3 RGB swapped data alignment

When the “RGB_SWAP” bit of ISP_CONFIG_CH% register is set, the RGB data alignment of data bus is swapped. This is shown in the following figure.

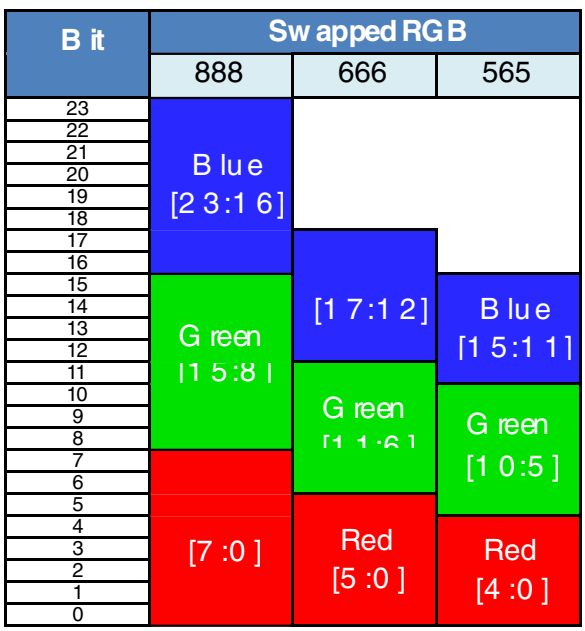

Figure 13-24. RGB swapped data alignment

13.5.2.5.4 Parallel-memory-storing data alignment

When ISP_CONFIG_CH[PARALLEL] bit is set, the outer bus width is 32 bits. If the byte count of the payload is not a multiple of 4, by performing the 0 padding makes the last data to 32bit.

13.5.2.6 Configuration

13.5.2.6.1 Image resolution

MIPI_CSI2 Slave block needs the configuration of Image resolution to measure one line length exactly and detect frame end. Vertical resolution register has 16bits (16'h0001 ~ 16'hFFFF) Horizontal resolution register has 16bits (16'h0004 ~ 16'hFFFC).

13.5.2.6.2 Image data format

In MIPI_CSI2, Image data format should be configured for transferring image data to ISP or CAM I/F.

13.5.2.6.3 YUV format

MIPI_CSI2 supports YUV formats: YUV420 8bit, YUV420 10bit, YUV420 Legacy, YUV420 8bit Chroma Shifted Pixel Sampling, YUV420 10bit Chroma Shifted Pixel Sampling, YUV422 8bit, and YUV422 10bit The following table describes Data type of YUV packets.

Table 13-10. Data type of YUV packets

Data type	Description
0x18	YUV420 8-bit
0x19	YUV420 10-bit
0x1A	Legacy YUV420 8-bit
0x1B	Reserved
0x1C	YUV420 8-bit CSPS (Chroma Shifted Pixel Sampling)
0x1D	YUV420 10-bit CSPS (Chroma Shifted Pixel Sampling)
0x1E	YUV422 8-bit
0x1F	YUV422 10-bit

13.5.2.6.4 RGB format

MIPI_CSI2 supports RGB formats: RGB444, RGB555, RGB565, RGB666, and RGB888. The following table describes Data type of RGB packets.

Table 13-11. Data type of RGB packets

Data type	Description
0x20	RGB444 (not supported)
0x21	RGB555 (not supported)
0x22	RGB565
0x23	RGB666
0x24	RGB888
0x25	Reserved

Table continues on the next page...

Table 13-11. Data type of RGB packets (continued)

Data type	Description
0x26	
0x27	

13.5.2.6.5 RAW format (Bayer RGB)

MIPI_CSI2 supports RAW formats: RAW6, RAW7, RAW8, RAW10, RAW12, and RAW14. The following table describes Data type of RAW packets.

Table 13-12. Data type of RAW packets

Data type	Description
0x28	RAW6
0x29	RAW7
0x2A	RAW8
0x2B	RAW10
0x2C	RAW12
0x2D	RAW14
0x2E	Reserved
0x2F	

13.5.2.6.6 Null and Blanking Data

For both the null and blanking data types CSIS V3.6.3 ignore the content of the packet payload data.

Table 13-13. Null and Blanking Data type

Data type	Description
0x10	Null
0x11	Blanking Data

13.5.2.7 Synchronization Short Packet Data type

Image Frame begins with a Frame Start and finishes with a Frame End packet. With these Frame synch packet, CSIS V3.6.3 generate Vertical Sync signal (VVALID). The Line synchronization packet (Line Start and Line End) generate Horizontal Sync signal (HVALID). But it can be generated by image data packet so that CSIS V3.6.3 doesn't support the Line Synchronization packets (0x02~0x03) and ignore it if it is received.

Table 13-14. Synchronization short packet data type

Data Type	Description
0x00	Frame Start Code
0x01	Frame End Code
0x02	Line Start Code (Not supported)
0x03	Line End Code (Not supported)
0x04 to 0x07	Reserved

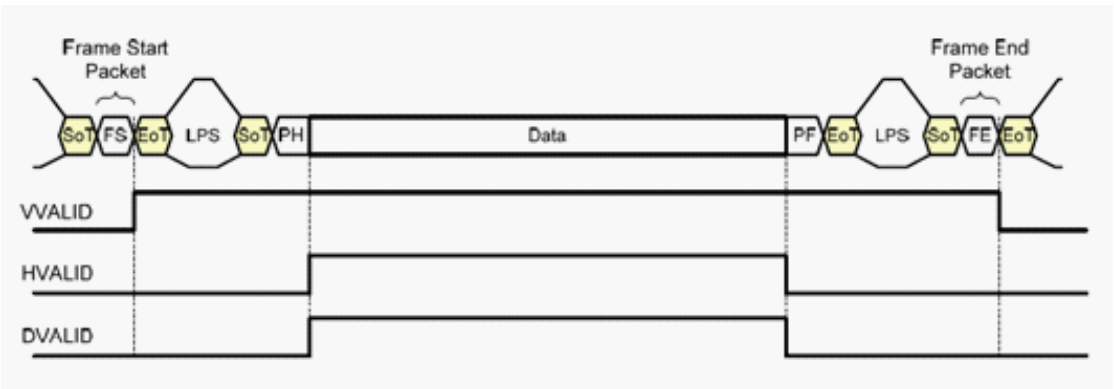

Figure 13-25. Synchronization example

13.5.2.8 Shadow Update

The configurations related to ISP registers (which are dataformat, vci, resolution and so on.) should not be varied during the run-time. So, they are updated by programming 'update_shadow' (in MIPI_CSI_CSIS_COMMON_CTRL register) in idle state. The scheme is described in the following figure.

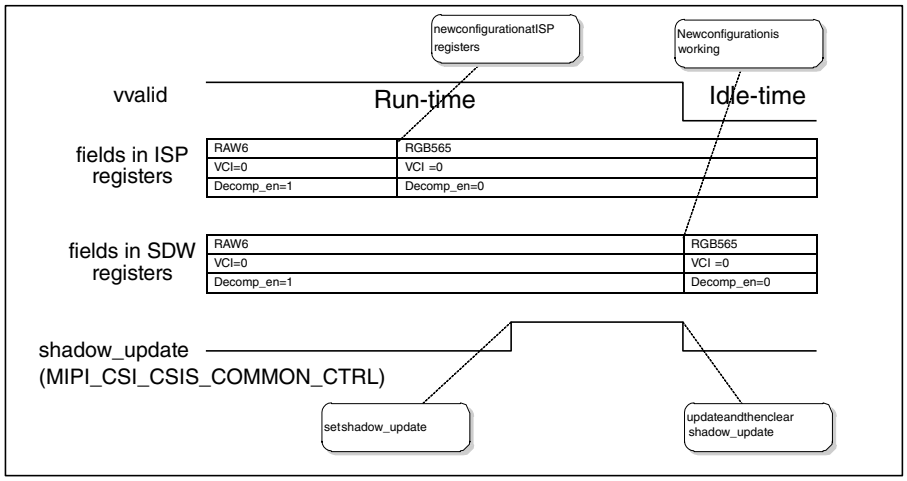

Figure 13-26. Operation of shadow_update

13.5.2.9 Clock Specification

MIPI_CSI2 have 3 clock sources: RX_BYTE_CLK_HS%, I_PCLK, and I_WRAP_CLK.

Table 13-15. Clock sources

Clock source	Description
I_PCLK	PCLK is system clock generated by general processor PLL.
i_RxByteClkHS%	This signal comes from data lane 0,1,2,3 of D-PHY.
I_ACLK	I_ACLK is external clock for pixel clock which is for using ISP or CAM I/F

13.5.2.9.1 Clock Domain

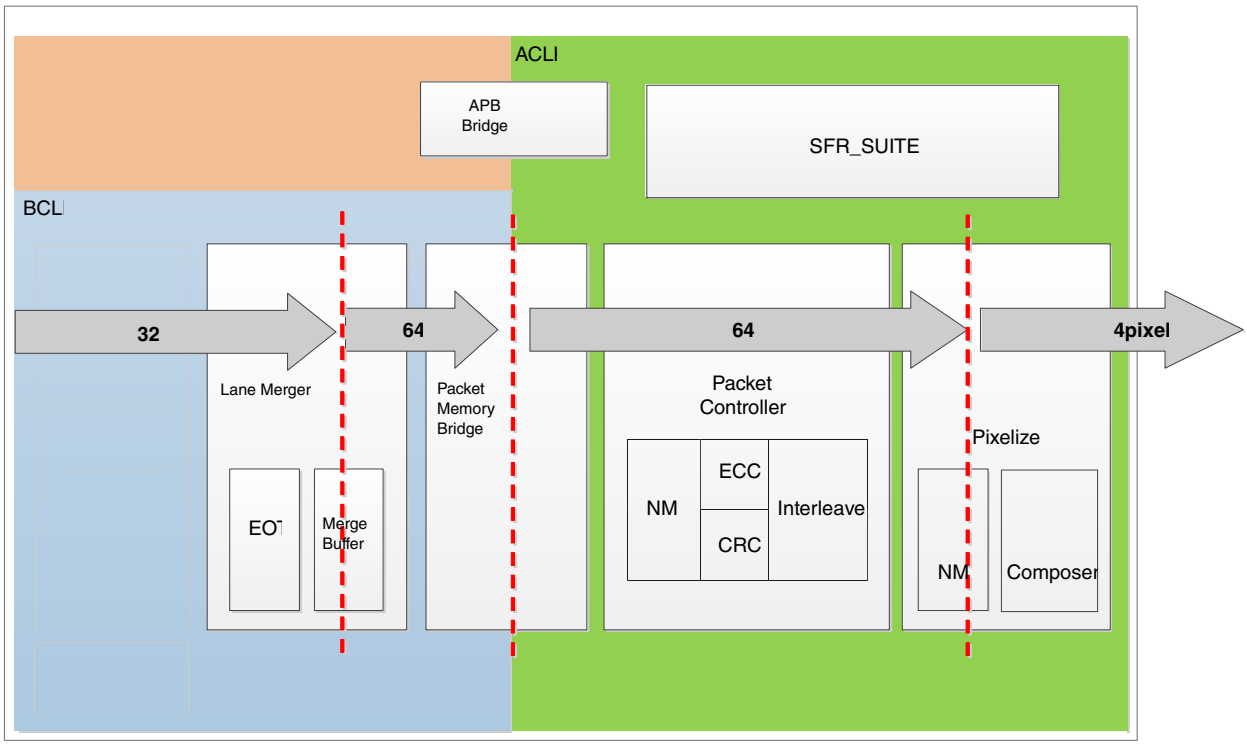

Figure 13-27. Block diagram of clock domain

The number of clock domain of CSIS V3.6.3 is 3:

- BYTE clock (RxByteCLKSH0)
- Pixel clock (I_ACLK)
- APB clock (I_PCLK)

The relationship between input and output bandwidth is that the output bandwidth should be faster than input bandwidth. There is an equation of previous relationship:

(FREQ. OF RX_BYTE_CLK_HS) X (NUMBER OF DATA LANE) X 8BITS ≤ (FREQ. OF PIXEL CLOCK) X (BITWIDTH OF IMAGE FORMAT) X (NUMBER OF PIXEL PER CLOCK)

When parallel mode is on, **(BITWIDTH OF IMAGE FORMAT) X (NUMBER OF PIXEL PER CLOCK) = 32**

13.5.2.10 Reset

Table 13-16. Reset

Reset	Usage
I_PRESETn	Global Asynchronous reset

13.5.2.11 Interrupts

Table 13-17. Interrupts

Signal	Description
O_INT_CSIS	Interrupt request signal

13.5.3 External Signals

Table 13-18. External Signals

Signal	Description	Direction
CLK_N	Negative MIPI Rx Differential Clock	I
CLK_P	Positive MIPI Rx Differential Clock	I
Dn_N	Negative MIPI Rx Differential Data	I
Dn_P	Positive MIPI Rx Differential Data	I

13.5.4 Initial Sequence

CSI Rx should be reset with D-PHY. Below Signal diagram is referred from Samsung D-PHY datasheet. This document describes the SFR setting and timing information.

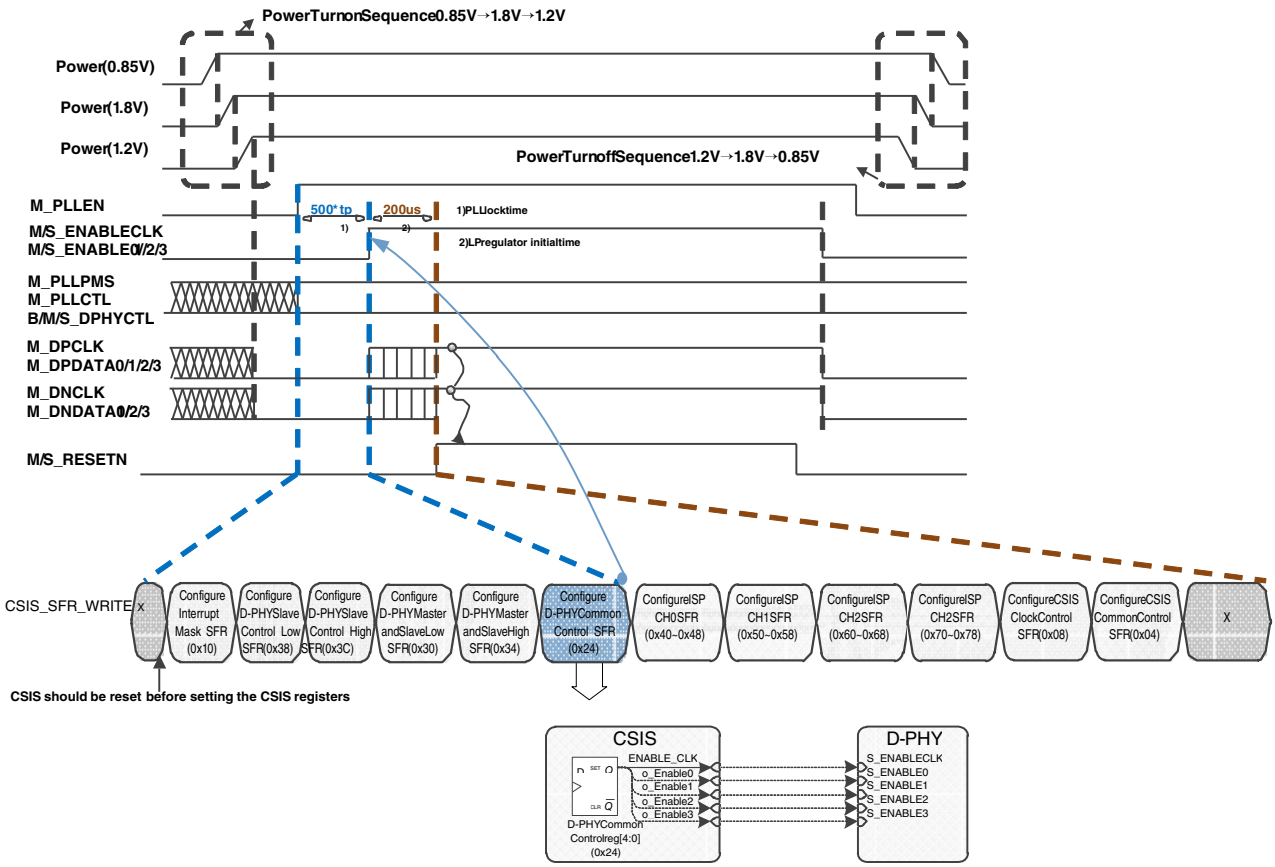

Figure 13-28. Initialize sequence

13.5.5 Application Information

13.5.5.1 Programming Model

Table 13-19. Behavior programming each case

No.	Pseudo Code	Description
1	APB_WRITE(MIPI_CSI_INTERRUPT_MASK, -)	set Interrupt Mask
2	APB_WRITE(MIPI_CSI_DPHY_MASTER_SLAVE_CTRL_LOW, -)	set DPHYBCTRL LSB
3	APB_WRITE(MIPI_CSI_DPHY_MASTER_SLAVE_CTRL_HIGH, -)	set DPHYBCTRL MSB
4	APB_WRITE(MIPI_CSI_DPHY_COMMON_CTRL, 0x11)	set DPHY HSSETTLE
5	APB_WRITE(MIPI_CSI_ISP_CONFIG_CH0, -)	set ISP_CH0 configuration

Table continues on the next page...

Table 13-19. Behavior programming each case (continued)

No.	Pseudo Code	Description
6	APB_WRITE(MIPI_CSI_ISP_RESOLUTION_CH0, -)	set ISP_CH0 resolution
7	APB_WRITE(MIPI_CSI_ISP_SYNC_CH0, -)	set ISP_CH0 sync
8	APB_WRITE(MIPI_CSI_CSIS_CLOCK_CTRL, -)	set CSIS clock control
9	APB_WRITE(MIPI_CSI_CSIS_COMMON_CTRL, -)	set CSIS common control(enable CSI)

13.5.6 MIPI CSI Memory Map/Register Definition

MIPI CSI1 Base address: 32E4_0000h

13.5.6.1 CSIS Common Control Register (MIPI_CSIx_CSIS_COMMON_CTRL)

Address: Base address + 4h offset

MIPI_CSIx_CSIS_COMMON_CTRL field descriptions

Field	Description
31–20 -	This field is reserved.
19–17 -	This field is reserved.

Table continues on the next page...

MIPI_CSIx_CSIS_COMMON_CTRL field descriptions (continued)

Field	Description
16 UPDATE_ SHADOW	Strobe of updating shadow registers After configuration, User has to set this bit for updating shadow registers. This bit is cleared automatically after updating shadow registers. 1 update the shadow registers 0 default
15–13 -	This field is reserved.
12 Reserved	This read-only field is reserved and always has the value 0.
11–10 INTERLEAVE_ MODE	Select Interleave mode ISP Configuration register of CH# is used for data interleave. 00 CH0 only, no data interleave 01 DT (Data type) only 10 Reserved 11 Reserved
9–8 LANE_NUMBER	Number of data lane 00 1 data lane 01 2 data lane 10 3 data lane 11 4 data lane
7–3 -	This field is reserved. -
2 Reserved	This read-only field is reserved and always has the value 0.
1 SW_RESET	Software reset All writable registers in CSI2 go back to initial state. This bit is de-asserted automatically after the software reset is done. **NOTE:** Notice : Almost MIPI CSI2 block uses “ByteClk” from D- PHY. This “ByteClk” is not continuous clock. User has to assert software reset when Camera module is turned off. 0 Ready 1 Reset
0 CSI_EN	MIPI CSI2 system enable 0 Disable 1 Enable

13.5.6.2 CSIS Clock Control Register (MIPI_CSIx_CSIS_CLOCK_CTRL)

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Field	Description
31–28 -	This field is reserved.
27–25 -	This field is reserved.
24 FRAME_START	FS packet is received, CH0.

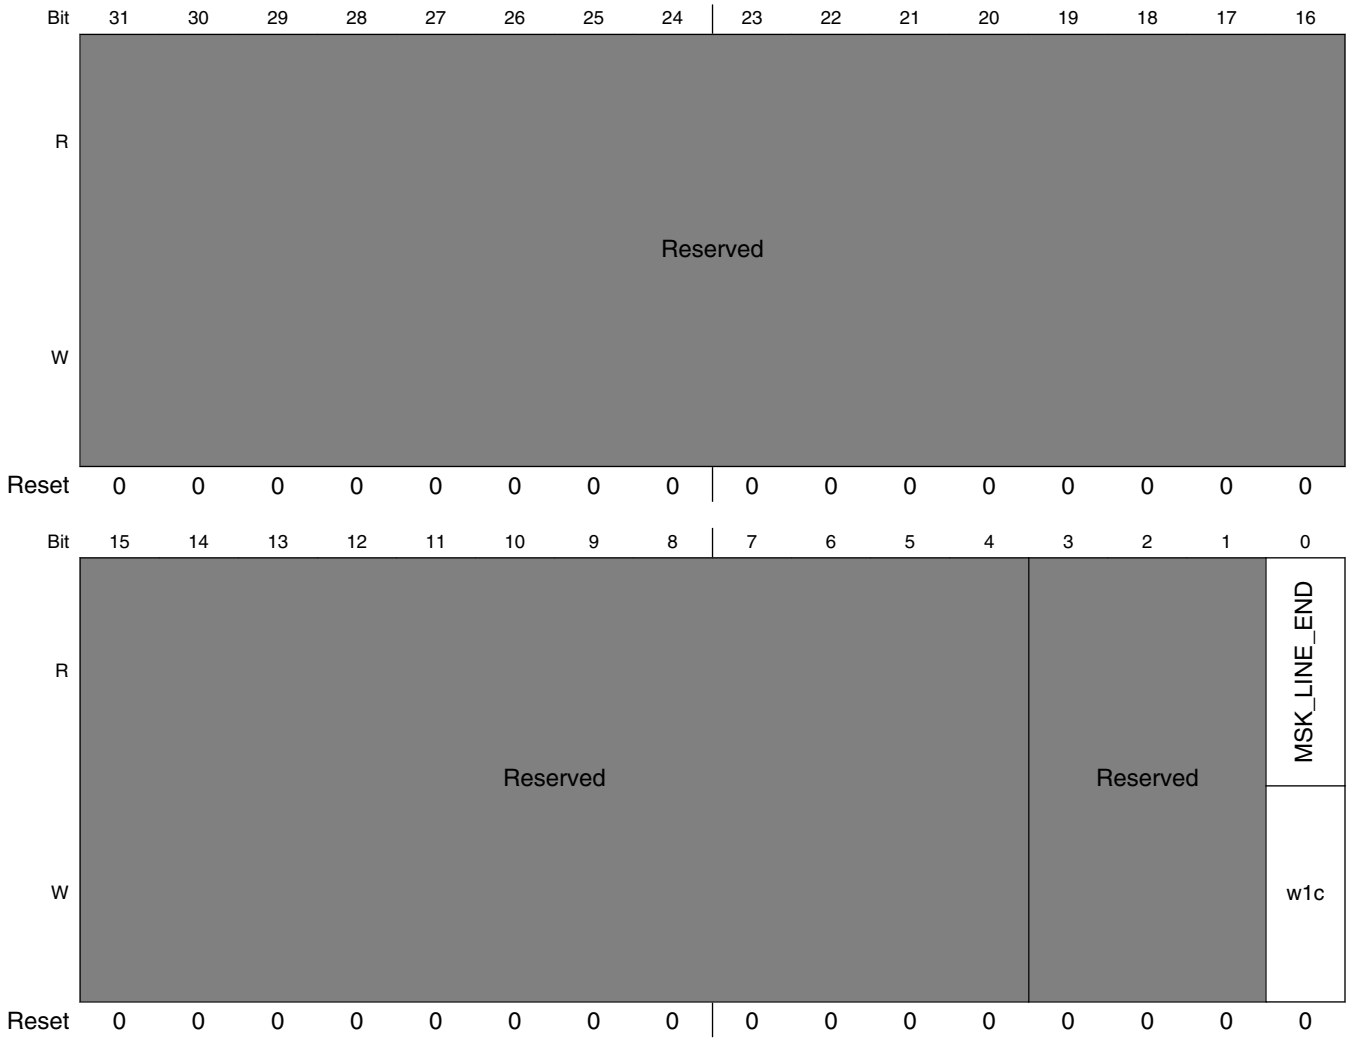

Table continues on the next page...

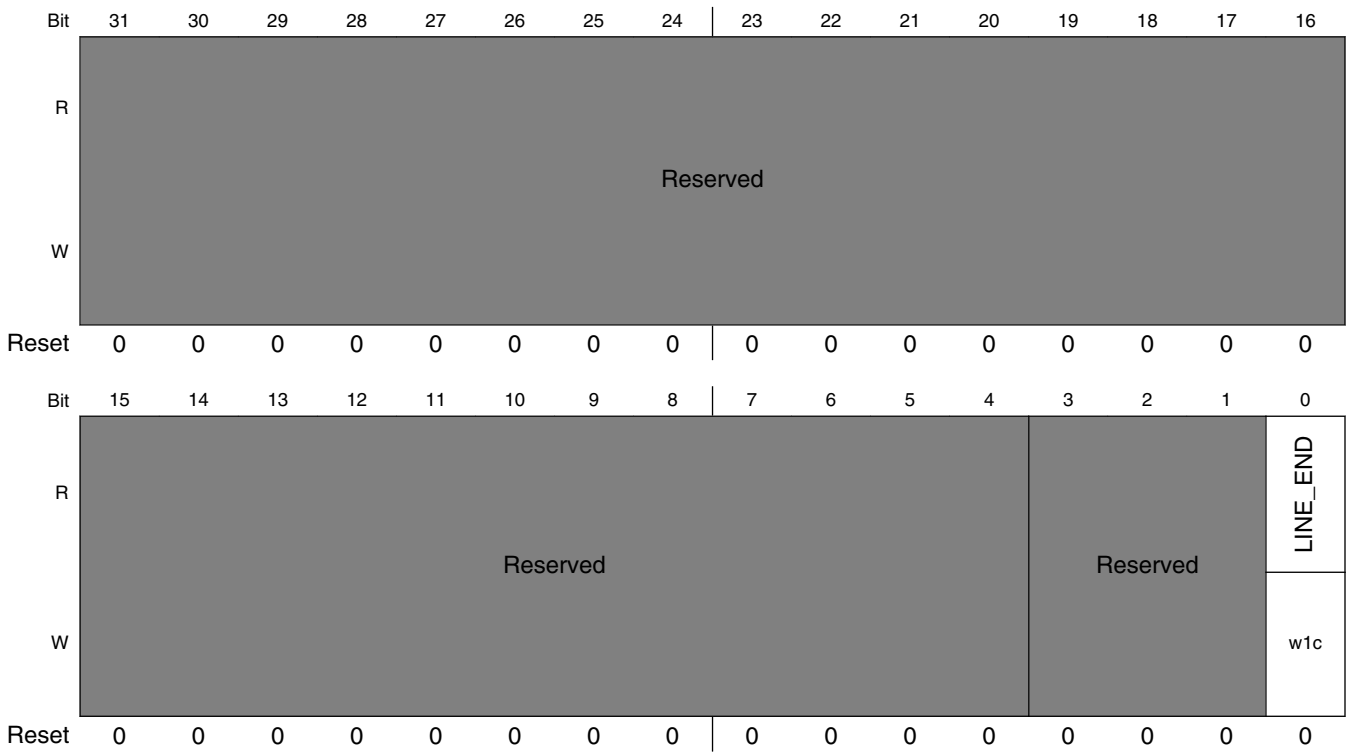
MIPI_CSIx_INTERRUPT_SOURCE_0 field descriptions (continued)

Field	Description
23–21 -	This field is reserved.
20 FRAME_END	FE packet is received, CH0.
19–16 ERR_SOT_HS	Start of transmission error, [Lane3,Lane2,Lane1,Lane0]
15–13 -	This field is reserved.
12 ERR_LOST_FS	Indication of lost of Frame Start packet, CH0. This field is set to '1' when the image data is received without frame start packet.
11–9 -	This field is reserved.
8 ERR_LOST_FE	Indication of lost of Frame End packet, CH0.
7–5 -	This field is reserved.
4 ERR_OVER	Overflow is caused in image FIFO. Outer bandwidth has to be faster than imputer bandwidth. But image FIFO can be overflow because of user's fault. There are 2 ways for preventing overflow. • Tune output pixel clock faster than current. • Tune input byte clock slowr than current. First case : WCLK_Src in CSIS_CTRL register shoud be set 1, and then assign faster clock Second case : user can set register in camera module through I2C channel. When this interrupt is generated: • Turn camera off • Assert software reset, if you didn't assert software reset, MIPI CSIS could not receive any more data. • Tune the clock frequency and re-configure all related registers. MIPI CSIS module is ready for operating.
3 ERR_WRONG_CFG	Wrong configuration **NOTE:** The received packet is not allocated to the PHYsical channel at any PHYsical channels (due to wrong data type or virtual channel id).
2 ERR_ECC	ECC error
1 ERR_CRC	CRC error
0 ERR_ID	Unknown ID error

13.5.6.5 Interrupt mask register 1 (MIPI_CSIx_INTERRUPT_MASK_1)

Address: Base address + 18h offset



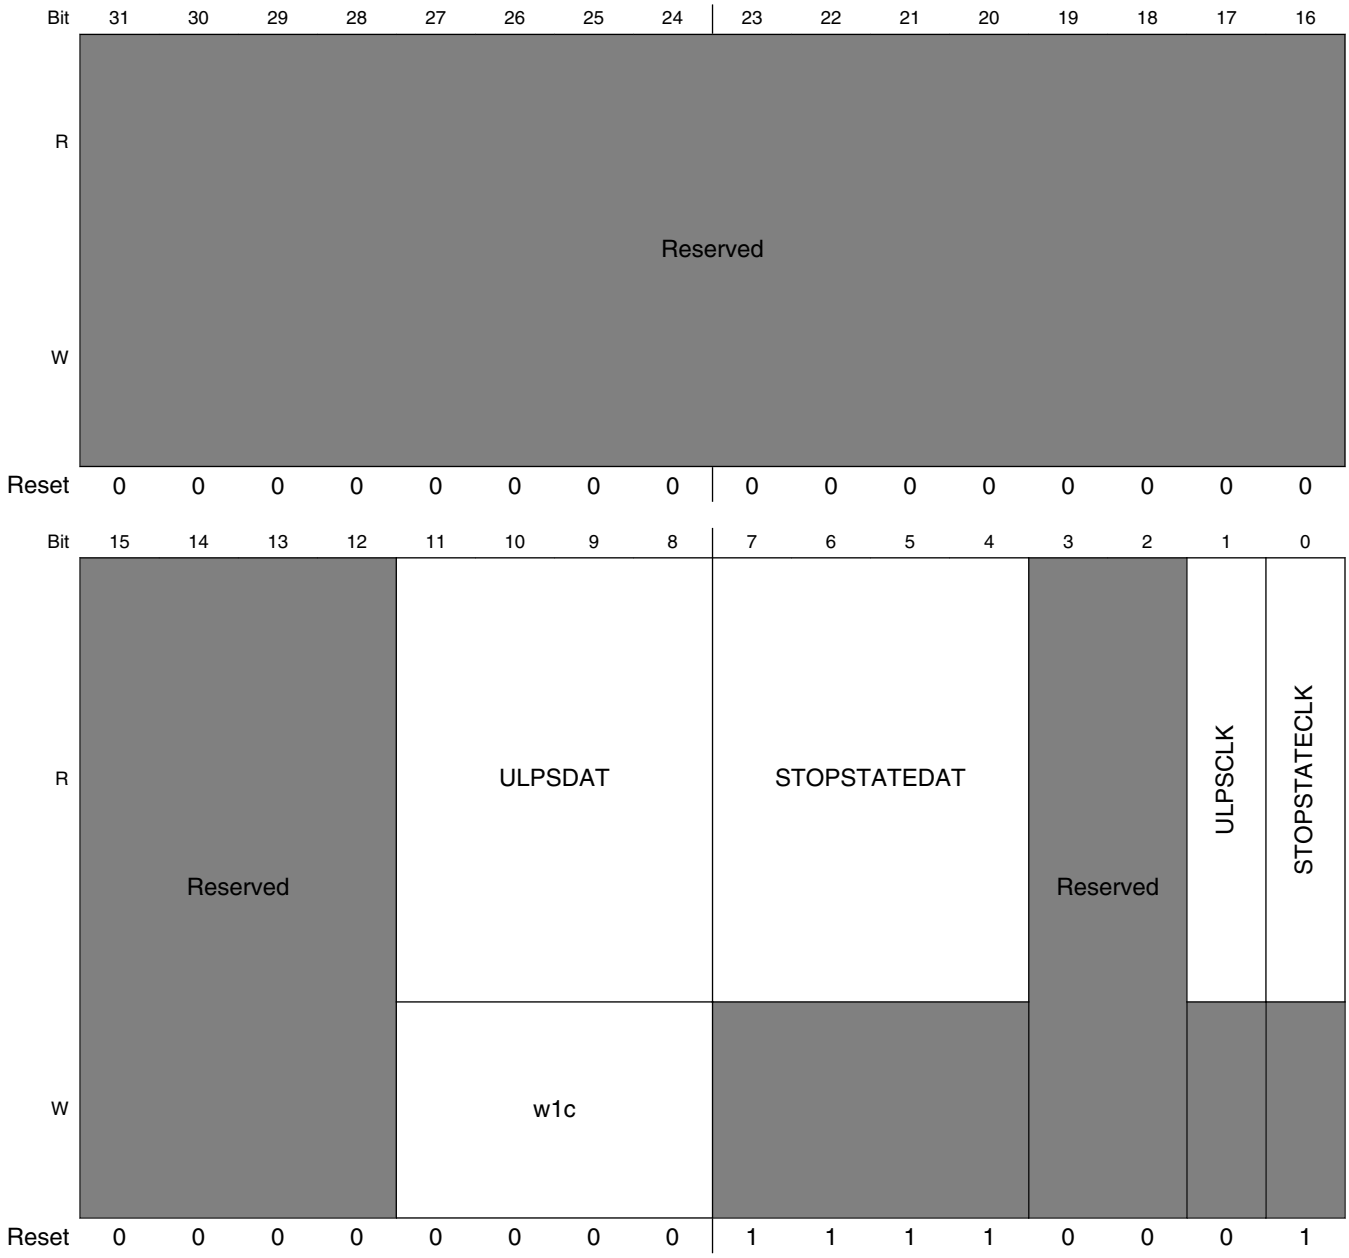
MIPI_CSIx_INTERRUPT_MASK_1 field descriptions

Field	Description
31–4 -	This field is reserved.
3–1 -	This field is reserved.
0 MSK_LINE_END	End of specific line, CH0.

13.5.6.6 Interrupt source register 1 (MIPI_CSIx_INTERRUPT_SOURCE_1)

Write ‘1’ clears status bit and write ‘0’ has no effect. This register is valid only during csis is enabled. All of register fields should be cleared after csis is enabled.

Address: Base address + 1Ch offset



MIPI_CSIx_INTERRUPT_SOURCE_1 field descriptions

Field	Description
31–4 -	This field is reserved.
3–1 -	This field is reserved.
0 LINE_END	End of specific line, CH0.

13.5.6.7 D-PHY status register (MIPI_CSIx_DPHY_STATUS)

Address: Base address + 20h offset

MIPI_CSIx_DPHY_STATUS field descriptions

Field	Description
31–12 -	This field is reserved.
11–8 ULPSDAT	Data lane [3:0] is in ULPS [7] : data lane 3

13.6 MIPI DSI Host Controller (MIPI_DSI)

13.6.1 Overview

MIPI Display Serial Interface (DSI) is a flexible, high-performance core that allows communication with MIPI DSI compliant peripherals.

13.6.1.1 Block Diagram

13.6.1.1.1 Total system block diagram

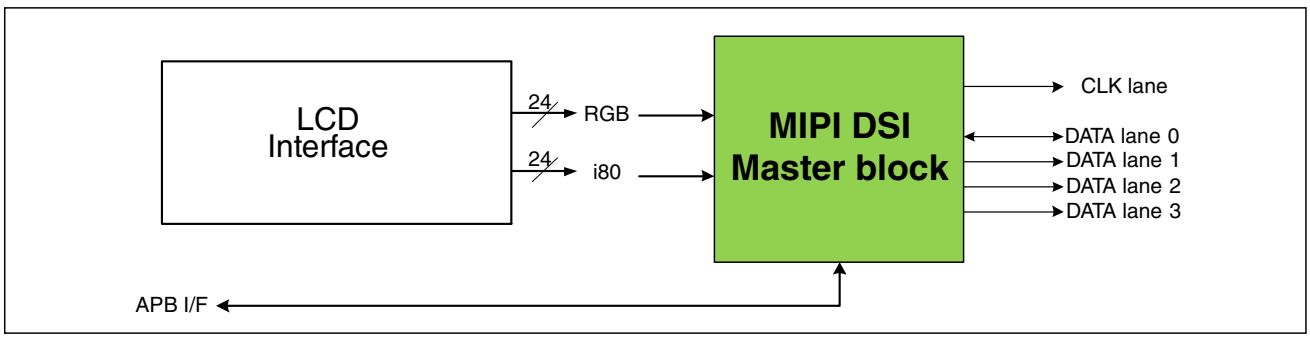

Figure 13-29. MIPI DSI master system block diagram

13.6.1.2 Features

The key features of MIPI DSI include:

- Complies to MIPI DSI Standard Specification V1.01r11
  - Maximum resolution ranges up to WQHD (2560x1440)
    - It should be decided on bandwidth between input clock (video clock) and output clock (D-PHY HS clock).
  - Supports 1, 2, 3, or 4 data lanes
  - Supports pixel format: 16bpp, 18bpp packed, 18bpp loosely packed (3 byte format), and 24bpp
- Interfaces
  - Complies with Protocol-to-PHY Interface (PPI) in 1.0Gbps / 1.5Gbps MIPI D-PHY
  - Supports RGB Interface for Video Image Input from general display controller
  - Supports S-i80(Synchronous i80) Interface for Command Mode Image input from display controller
  - Supports PMS control interface for PLL to configure byte clock frequency
  - Supports Prescaler to generate escape clock from byte clock

NOTE

Virtual Channel support is not implemented in chip level.

13.6.2 Functional description

The following sections describe functional details of the MIPI DSI module.

13.6.2.1 MIPI DSI master and D-PHY I/F block diagram

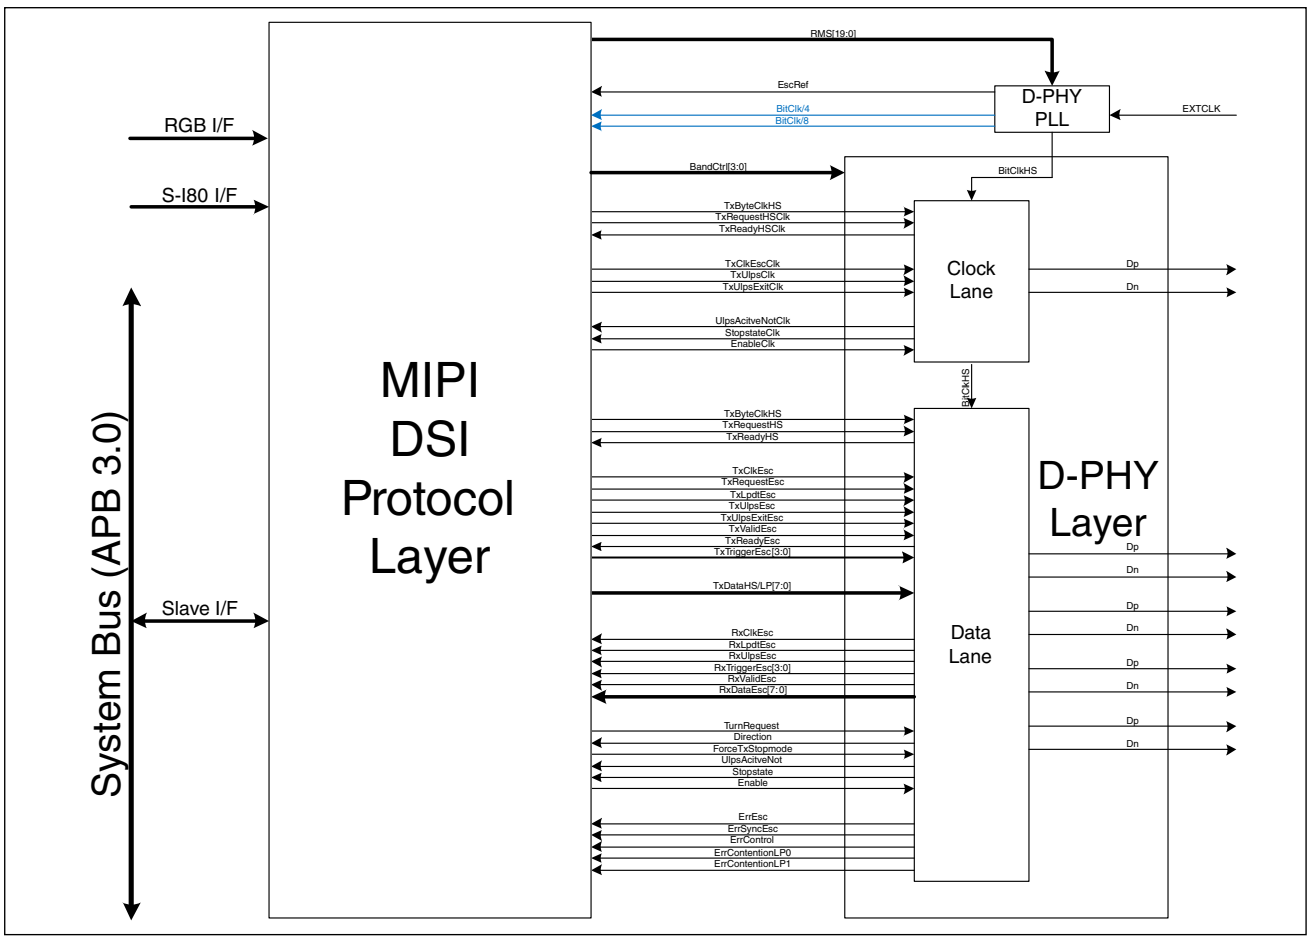

Figure 13-30. PPI I/F block diagram

13.6.2.2 MIPI DSI master block diagram

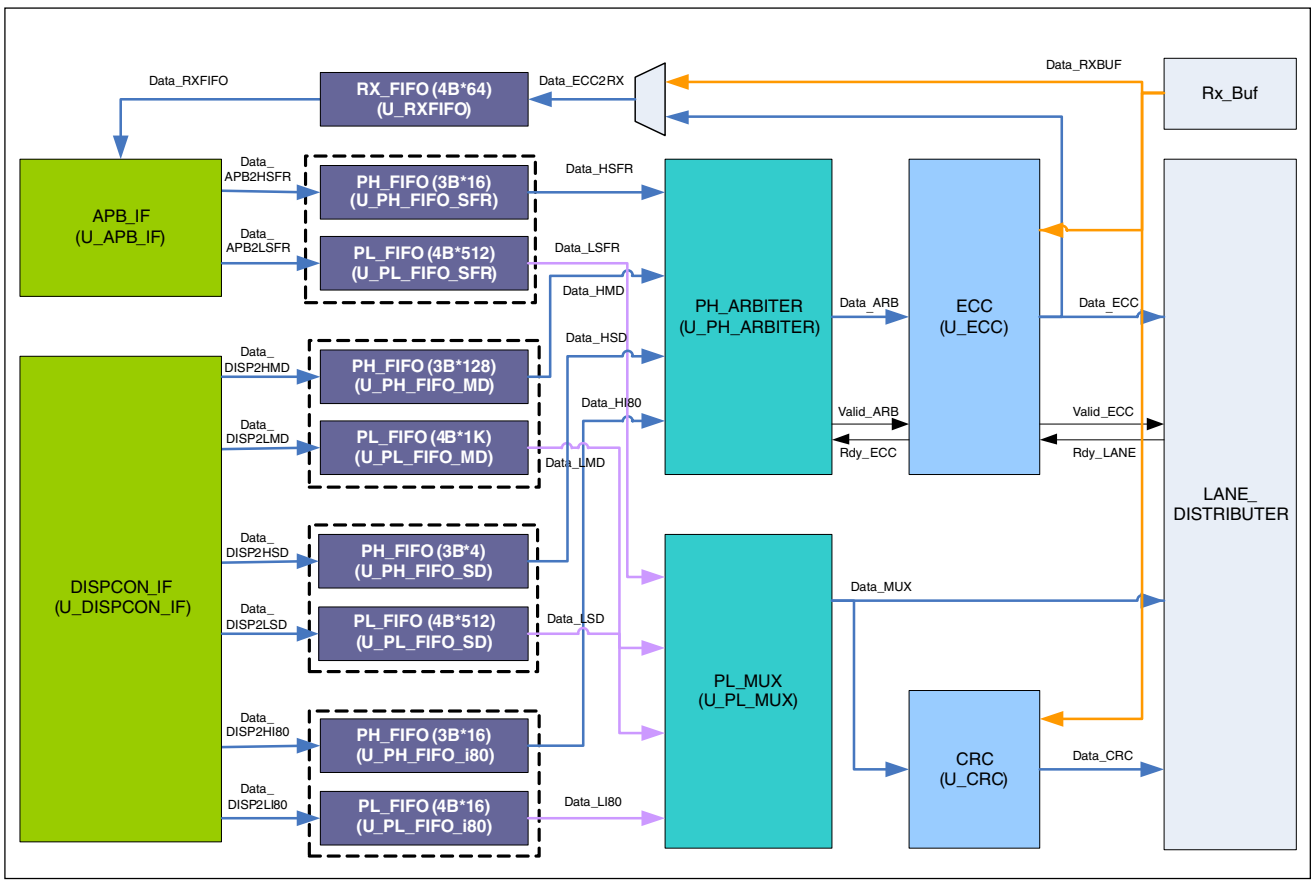

Figure 13-31. MIPI DSI master module block diagram

13.6.2.3 Internal primary FIFOs

Table 13-20 describes configurable-sized primary FIFOs.

Table 13-20. Internal primary FIFO list

Port	FIFO type	Size	Description
Main display for RGB I/F and S-i80 I/F	Packet Header FIFO	3Byte X 128 depth	Packet header FIFO for main display
	Payload FIFO	4Byte X 1024 depth	Payload FIFO for main display image (SRAM used)
Sub display for S-i80 I/F image data	Packet Header FIFO	3Byte X 4 depth	Packet header FIFO for S-i80 I/F sub display
	Payload FIFO	4Byte X 512 depth	Payload FIFO for S-i80 I/F sub display image (SRAM used)
Command for S-i80 I/F command	Packet Header FIFO	3Byte X 16 depth	Packet header FIFO for S-i80 I/F command packet

Table continues on the next page...

Table 13-20. Internal primary FIFO list (continued)

Port	FIFO type	Size	Description
	Payload FIFO	4Byte X 16 depth	Payload FIFO for S-i80 I/F command long packet payload
SFR for general packets	Packet Header FIFO	3Byte X 16 depth	Packet header FIFO for general packet
	Payload FIFO	4Byte X 512 depth	Payload FIFO for general long packet (SRAM used)
RX FIFO	Packet header and Payload FIFO	4Byte X 64 depth	Rx FIFO for LPDR. This FIFO is common for packet header and payload

13.6.2.4 Packet header arbitration

There are four-packet headers FIFOs for Tx, namely, main display, sub display, S-i80 INTERFACE command, and SFR FIFO. The main and sub display FIFO packet headers contain the image data, while the S-i80 INTERFACE command FIFO packet header contains the command packets. On the other hand, the SFR FIFO packet header contains command packets, sub display image data (in Video mode), and so on.

The packet header arbiter has a “Fixed priority” algorithm. Priority order is fixed as main display, sub display, S-i80 INTERFACE command, and SFR FIFO packet header.

In the Video mode, sub display, and S-i80 INTERFACE command FIFO are not used. The SFR FIFO packet header checks if the main display FIFO is empty (no request) in not-active image region and then sends its request.

13.6.2.5 RxFIFO Structure

To read the packets received via low power data receiving mode, RxFIFO acts like an SFR. RxFIFO is an asynchronous FIFO with ByteClk and PCLK domains as input clock and output clock domains respectively. The Rx data is synchronized to RxClk. RXBUF has four Rx Byte buffers for aligning byte to word.

The packet headers of all the packets stored in RXFIFO are word-aligned, that is, the first byte of a packet is always stored in LSB. For example, if a long packet has 7-byte payload, the last byte is filled with dummy byte and the next packet is stored in the next word, as shown in Figure 13-32.

NOTE

CRC data is not stored in RxFIFO.

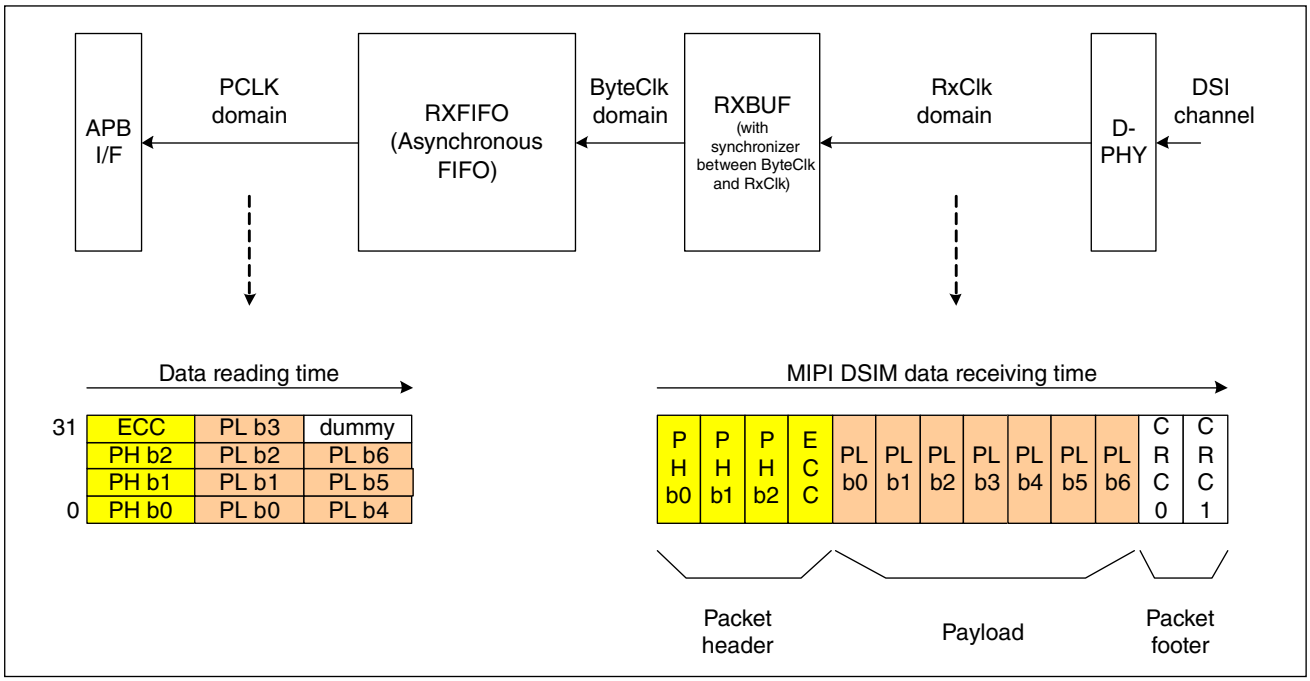

Figure 13-32. Rx data word alignment

13.6.2.6 Interfaces and protocol

Display Controller-to-DSI Conceptual Signal Converting Diagram in Video Mode.

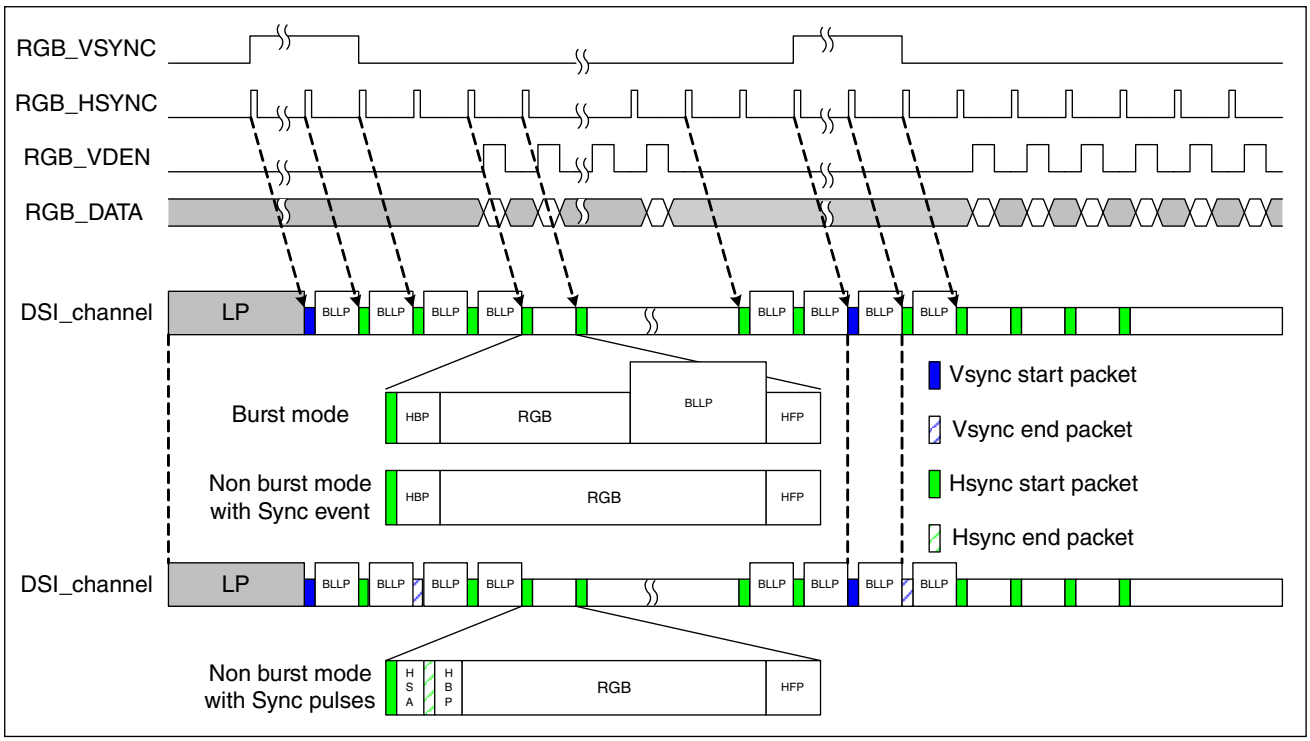

Figure 13-33. Signal converting diagram in video mode

13.6.2.7 Interface timing and protocol

13.6.2.7.1 Display controller interface

MIPI DSI Master (DSIM) has two-display controller interfaces, namely, RGB INTERFACE for main display and CPU INTERFACE (S-i80 INTERFACE) for main display/sub display. The Video mode uses RGB INTERFACE while the Command mode uses CPU INTERFACE.

The RGB image data is loaded on the data bus of RGB INTERFACE and S-i80 INTERFACE with the same order: RGB_VD[23:0] or SYS_VDOUT[23:0] is {R[7:0],G[7:0],B[7:0]}. Each byte aligns to the most significant bit. For instance, in the 12-bit mode, only three 4-bit values are valid as R, G, and B each, that is, data[23:20], data[15:12], and data[7:4]. The DSIM ignores rest of the bits.

13.6.2.7.2 RGB interface

Vsync, Hsync, and VDEN are active high signals. Among the three signals, Vsync and Hsync are pulse types that spend several video clocks. RGB_VD[23:0] is {R[7:0],G[7:0],B[7:0]}. All sync signals are synchronized to the rising edge of

RGB_VCLK. The display controller sends minimum one horizontal line length of Vsync pulse, V back porch (VBP), and V front porch (VFP). Hsync pulse width should be longer than 1-byte clock cycle.

13.6.2.7.2.1 HSA mode

HSA mode specifies the Horizontal Sync Area packet mode.

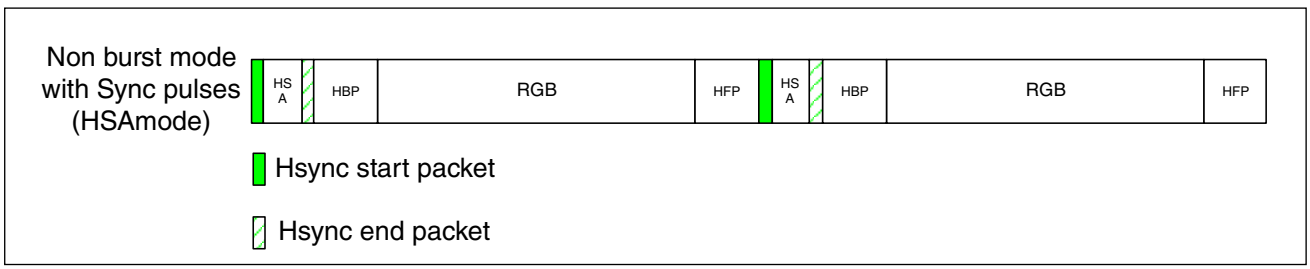

Figure 13-34. Block timing diagram of HSA enable mode (HSA mode reset : DSI_CONFIG[20] = 0)

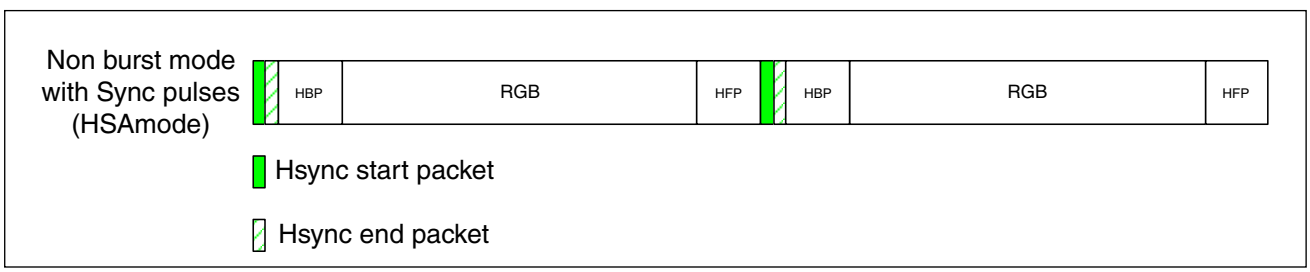

Figure 13-35. Block timing diagram of HSA disable mode (HSA mode set : DSI_CONFIG[20] = 1)

13.6.2.7.2.2 HBP mode

This option is valid only for burst mode. HBP mode specifies the Horizontal Back Porch packet mode.

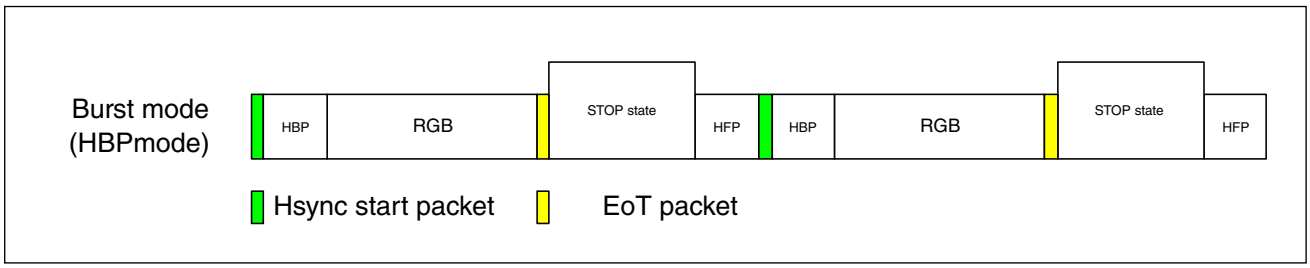

Figure 13-36. Block timing diagram of HBP enable mode (HBP mode reset : DSI_CONFIG[21] = 0)

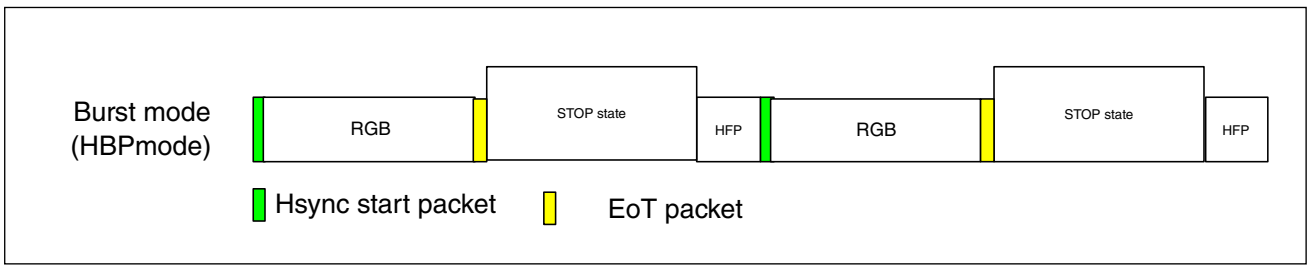

Figure 13-37. Block timing diagram of HBP disable mode (HBP mode set : DSI_CONFIG[21] = 1)

13.6.2.7.2.3 HFP mode

This option is valid only for burst mode. HFP mode specifies Horizontal Front Porch packet mode.

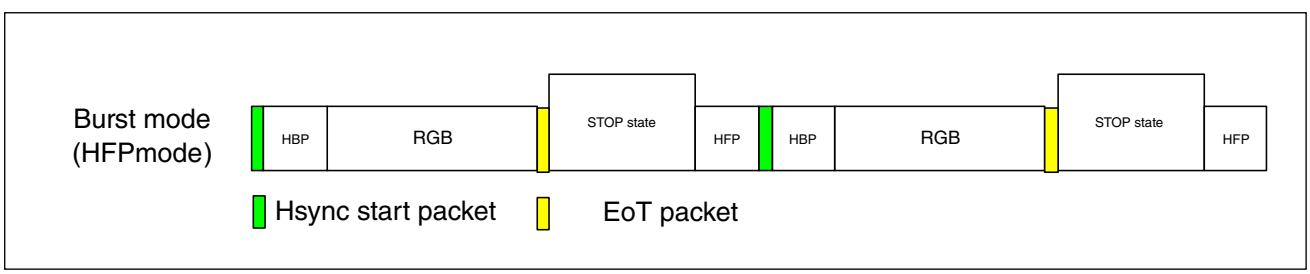

Figure 13-38. Block timing diagram of HFP enable mode (HFP mode set : DSI_CONFIG[22] = 0)

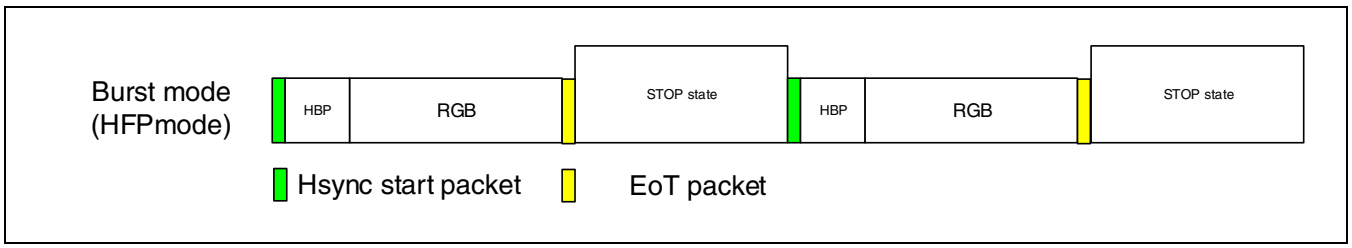

Figure 13-39. Block timing diagram of HFP disable mode (HFP mode set : DSI_CONFIG[22] = 1)

13.6.2.7.2.4 HSE mode

HSE mode is Horizontal Sync End packet mode.

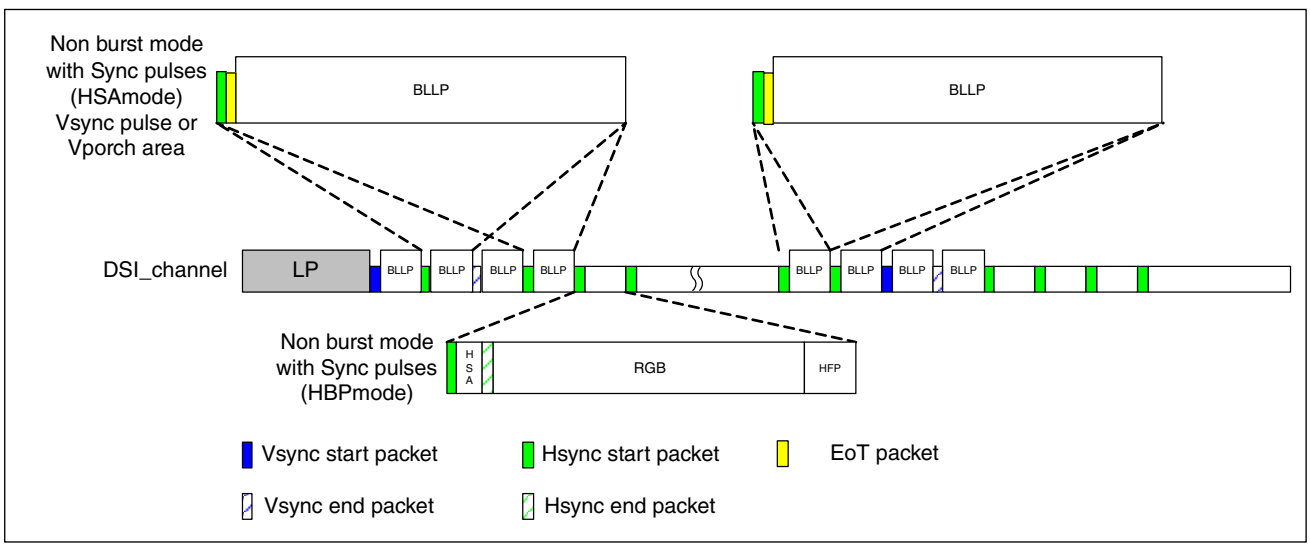

Figure 13-40. Block timing diagram of HSE enable mode (HSE mode reset : DSI_CONFIG[23] = 0)

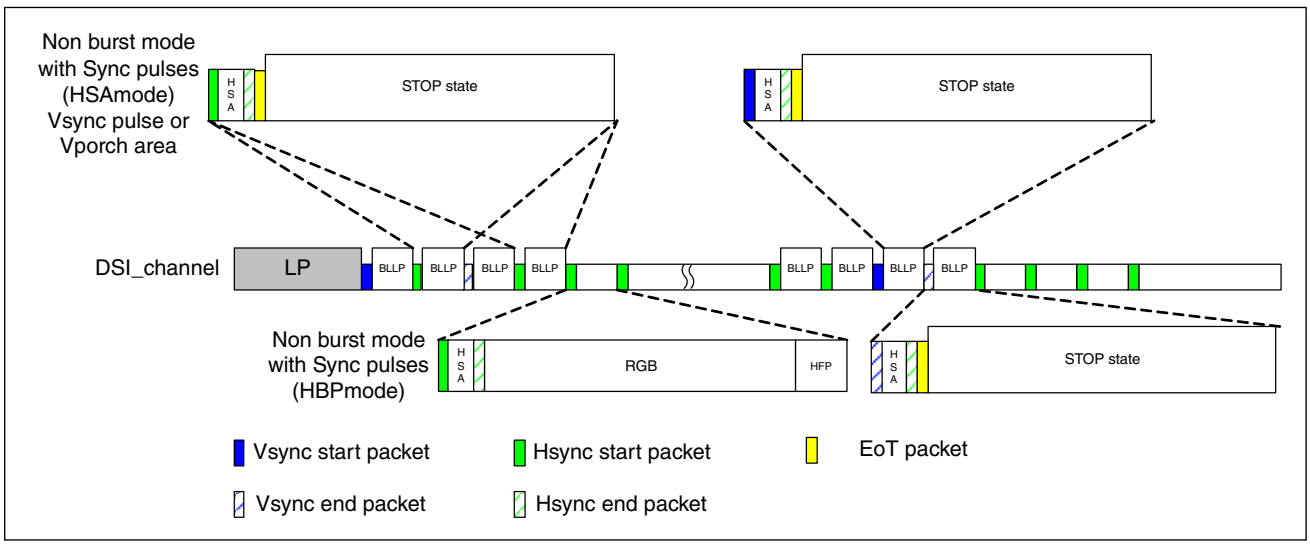

Figure 13-41. Block timing diagram of HSE disable mode (HSE mode set : DSI_CONFIG[23] = 1)

13.6.2.7.2.5 Transfer general data in video mode

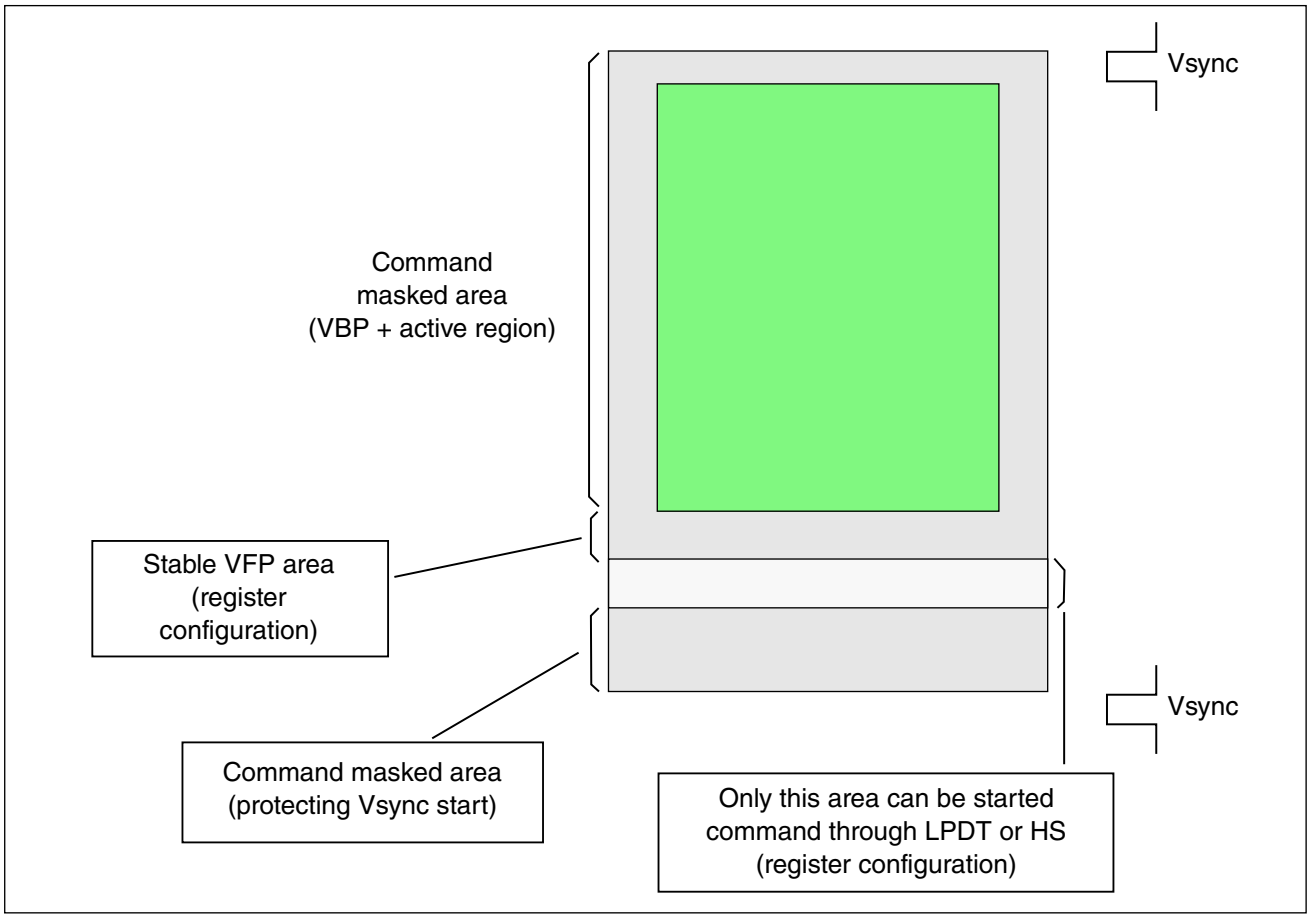

Figure 13-42. Stable VFP Area Before Command Transfer Allowing Area

MIPI DSIM Converts RGB Interface to Video Mode.

Vsync and Hsync packets are extremely important to protect image in Video mode. MIPI DSIM allows several lines in VFP area to transfer general data transfer. As shown in Figure 13-42, the vertical front porch is divided into three areas, namely, Stable VFP area, Command allowed area, and Command masked area.

The DSI_MVPORCH register configures stable VFP area. Configuration boundary is 11'h000 ~ 11'h7FFF.

The register also configures the command allowed area. Configuration boundary is 4'h0 ~ 4'hF in DSI_MVPORCH. Only this area is allowed to start "command transfer" through HS mode or Low Power Data Transmission (LPDT). In LPDT, data transferring takes a long time to complete (approximately hundreds of microseconds or more). In this time, Hsync packet does not arrive due to LPDT long packet. MIPI DSIM comprises of big size FIFO for lost Hsync packet. After LPDT, MIPI DSIM transfers these Hsync packets immediately through HS mode.

To protect Vsync, command masked area is masked area. This area is calculated using LPDT bandwidth. For example, if EscClk is 10MHz, the maximum long packet payload size is 1KB and LPDT, LPDT transferring time is 824us (packet size: 1030byte, LPDT maximum bandwidth: 10Mbps). If one line time is 20us, the line timing violation occurs in 42 lines. Therefore, command masked area is larger than 42 + "block". This "block" is transferring time of the violated Hsync packets.

Display controller should be configured in such a way that VFP lines are sum of stable VFP, command allowed area, and command masked area.

13.6.2.7.3 S-i80 interface

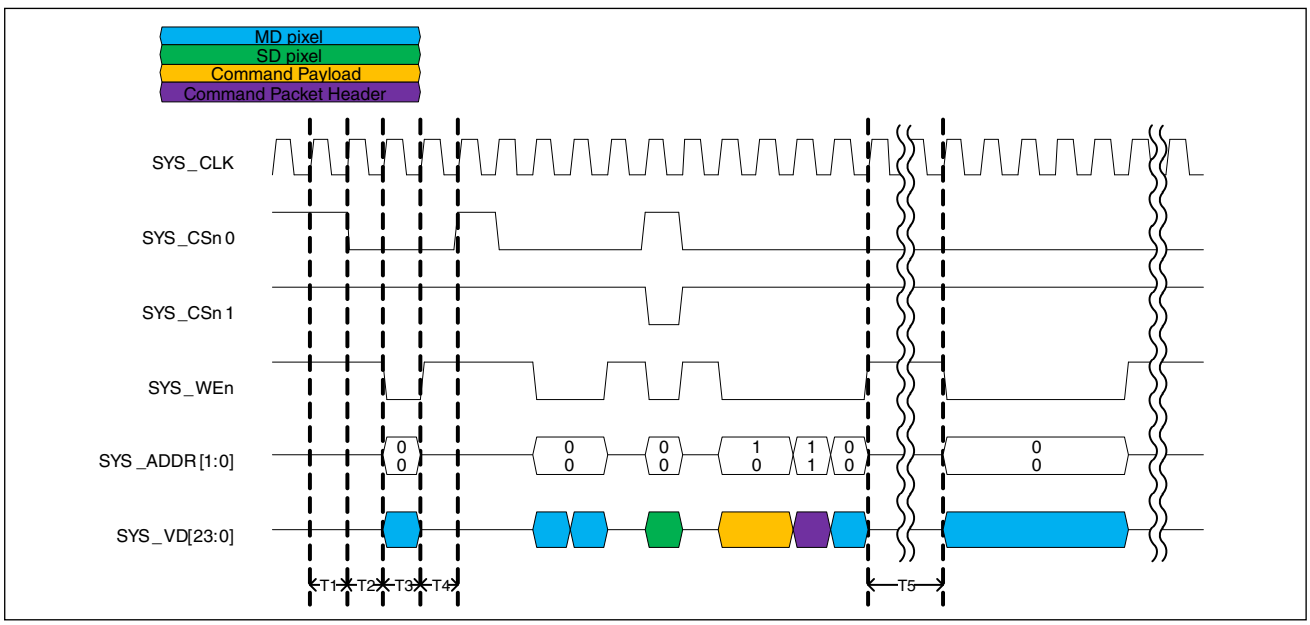

Figure 13-43. S-i80 I/F timing diagram

- T1 ≥ 1 clock cycle.
- T2 ≥ 0 clock cycle.
- T3 ≥ 1 clock cycle.
- T4 ≥ 0 clock cycle.
- T2+T3+T4 > 1 cycle of Byte clock.
- T5 ≥ 10 clock cycle (every horizontal blank period).

A display controller generates these signals with its internal clock: SYS_CS0/CS1, SYS_WE, and SYS_VD. MIPI DSI master decodes the SYS_ADDR. Table 13-21 describes the Command mode Interface address map.

Table 13-21. Command mode interface address map

SYS_ADDR[1:0]	Description
2'b00	Image data
2'b01	Reserved
2'b10	Payload data
2'b11	Packet Header

Figure 13-44 shows how MIPI DSI Master makes packet from the image data stream via S-i80 INTERFACE in Command mode. MIPI DSI master makes packet from the first line with Display Command Set (DCS) command "write_memory_start" and the other lines with DCS command "write_memory_continue".

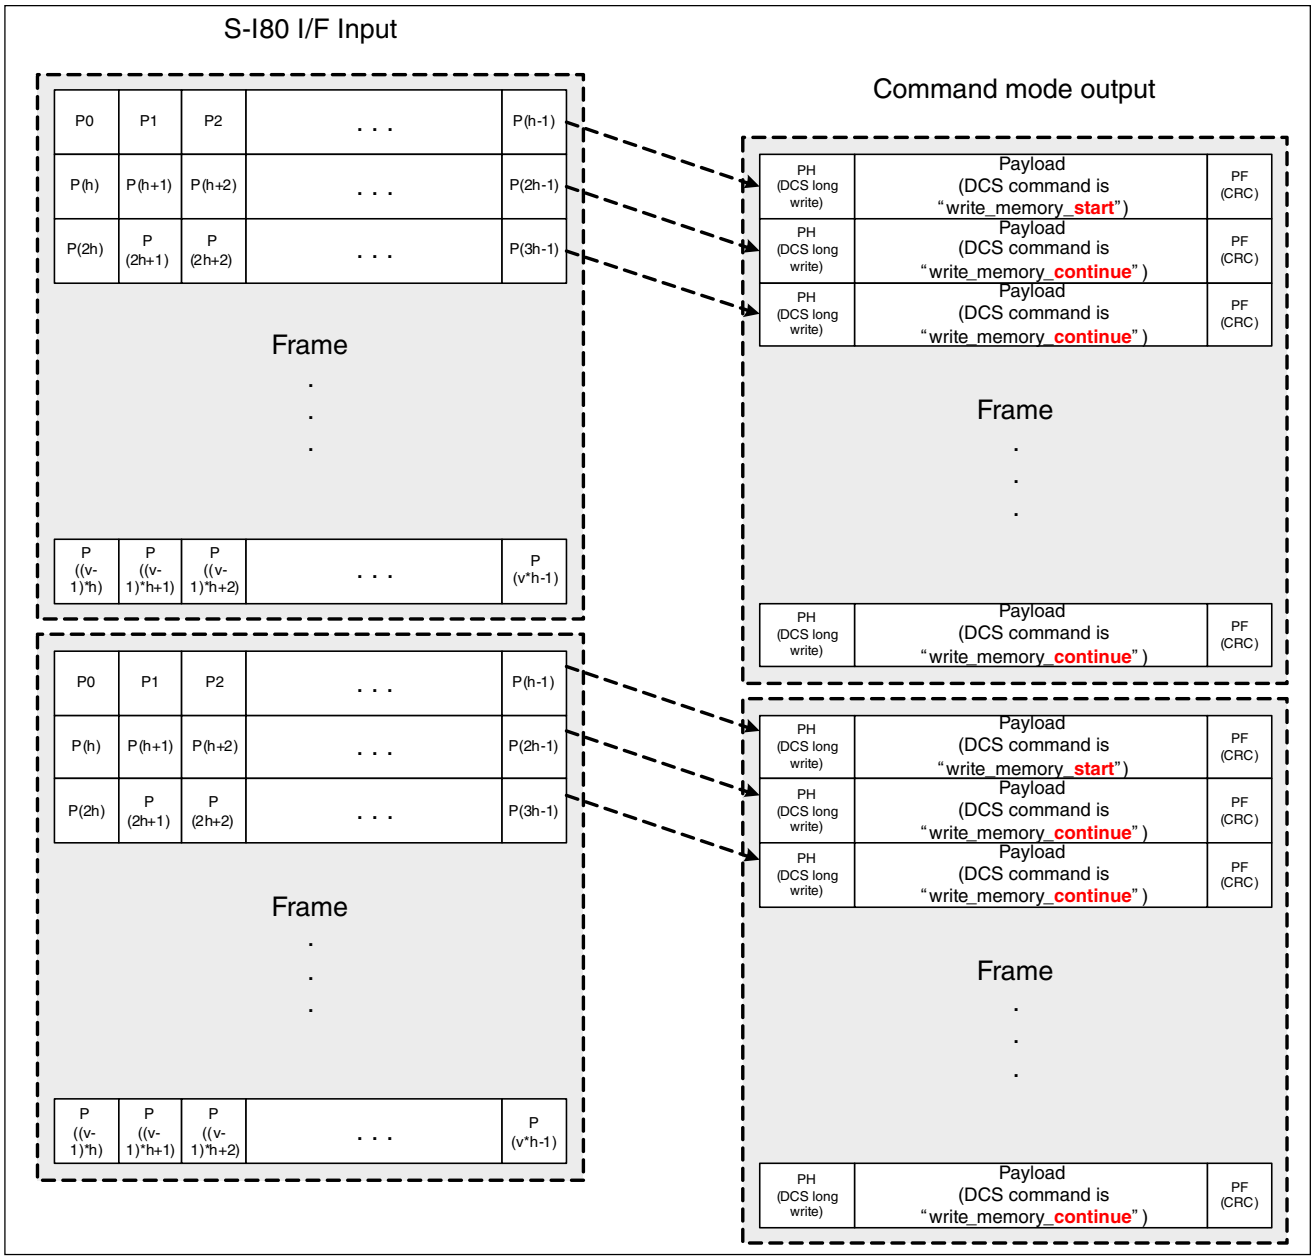

Figure 13-44. Packetizing for MIPI DSI command mode from S-i80 I/F

13.6.2.7.4 Relation between input transactions and DSI transactions

Table 13-22. Relation between input transactions and DSI transactions

Input Interface	Input transaction	DSI Transaction
RGB	RGB transaction	Specifies the RGB Packet. 888, 666, 666 (loosely packed), and 565 should be specified via register configuration.
RGB / S-i80	RGB / S-i80 Image Transaction	Specifies the Data type, that is, "DCS Long Write packet".

Table continues on the next page...

Table 13-22. Relation between input transactions and DSI transactions (continued)

Input Interface	Input transaction	DSI Transaction
		(DCS command is "memory write start/continue".)
S-i80	S-i80 Command Transaction	Specifies any DSI packet. Bytes in S-i80 transaction should be the same bytes in DSI packets.
SFR	Header and Payload FIFO access	Specifies any DSI Packets. Bytes in APB transaction should be the same bytes in DSI packets.

13.6.2.7.5 PPI interface timing and protocol

13.6.2.7.5.1 High speed data transfer

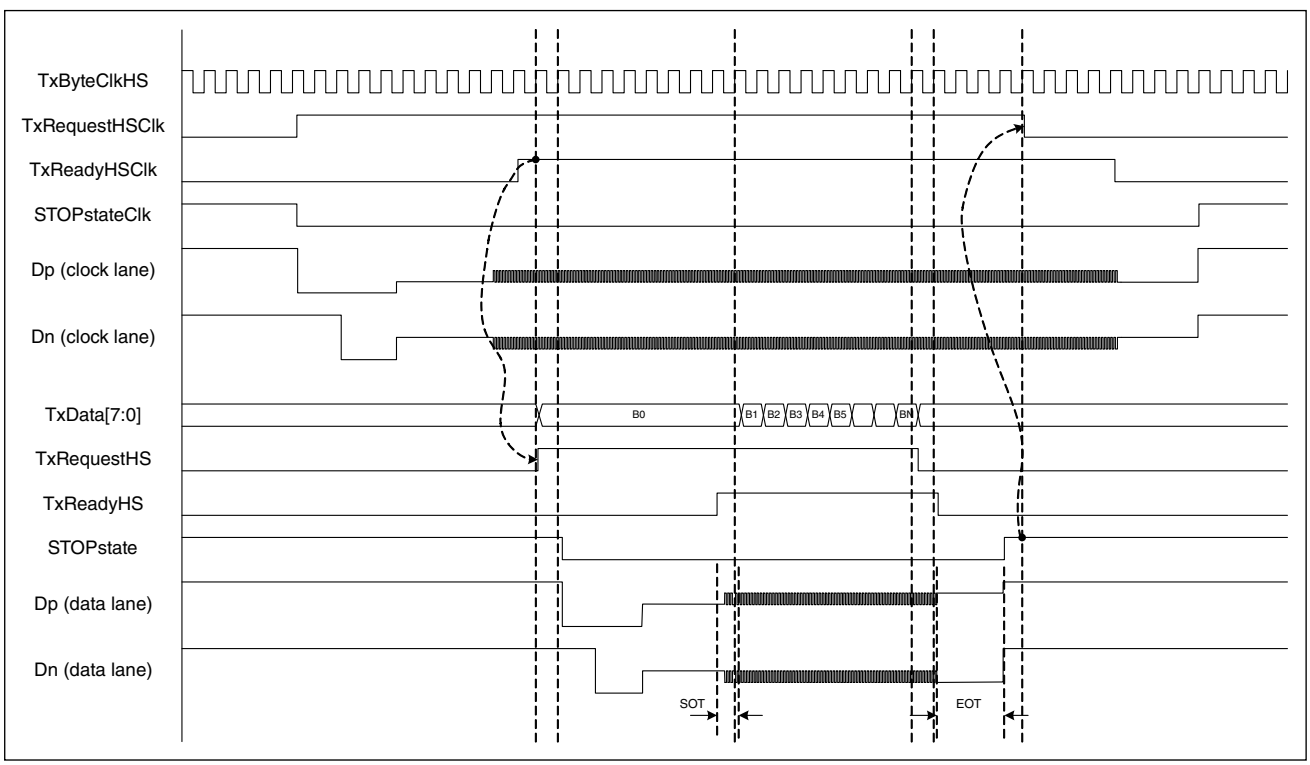

Figure 13-45. Timing diagram of high speed data transfer

13.6.2.7.5.2 Low power data transfer

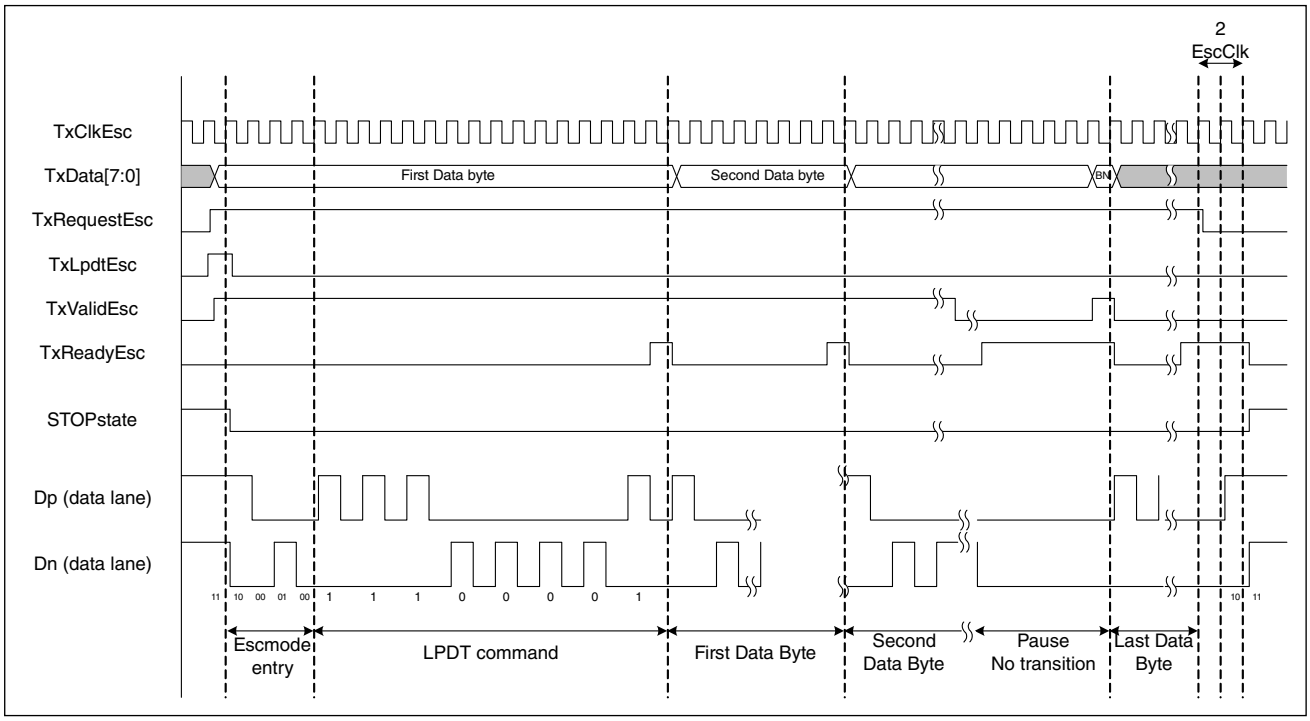

Figure 13-46. Timing diagram of low power data transfer

13.6.2.7.5.3 Ultra-Low power state

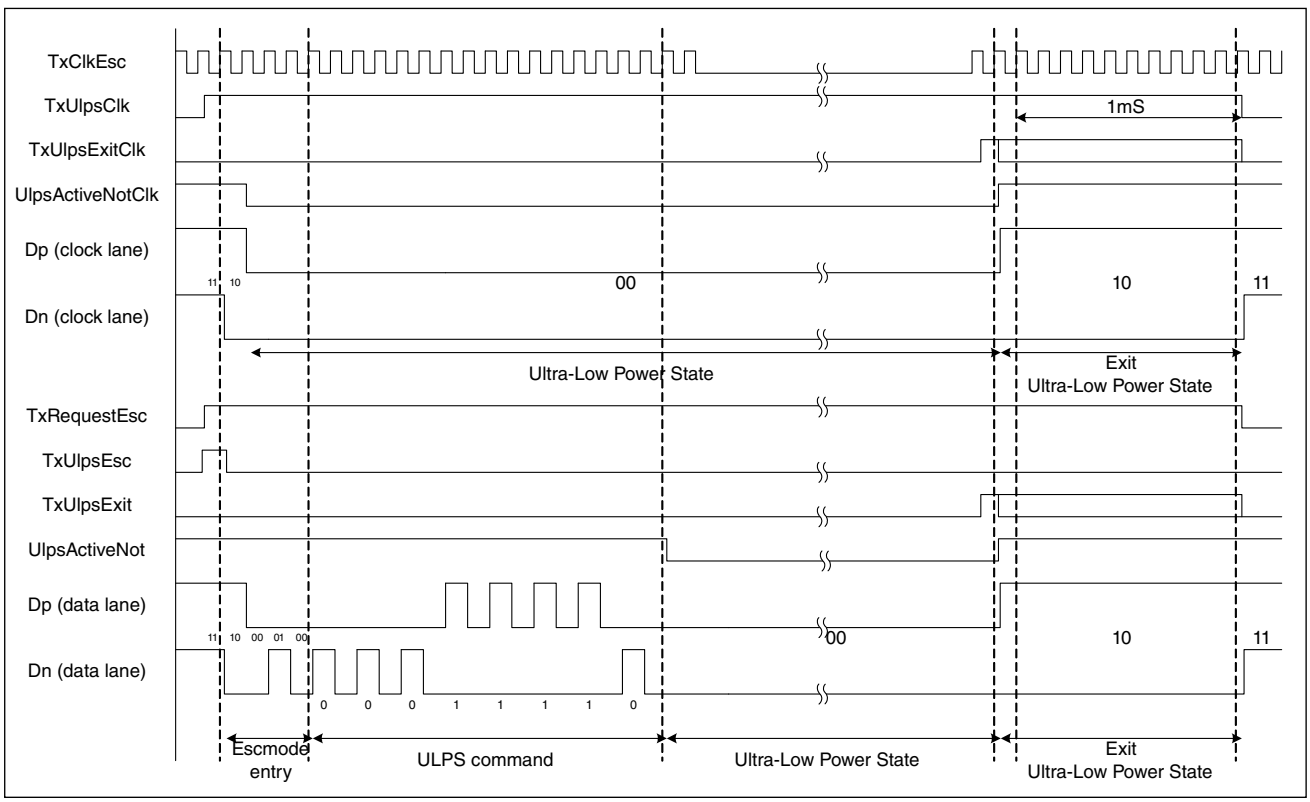

Figure 13-47. Timing diagram of ultra low power state

13.6.2.7.5.4 Trigger function

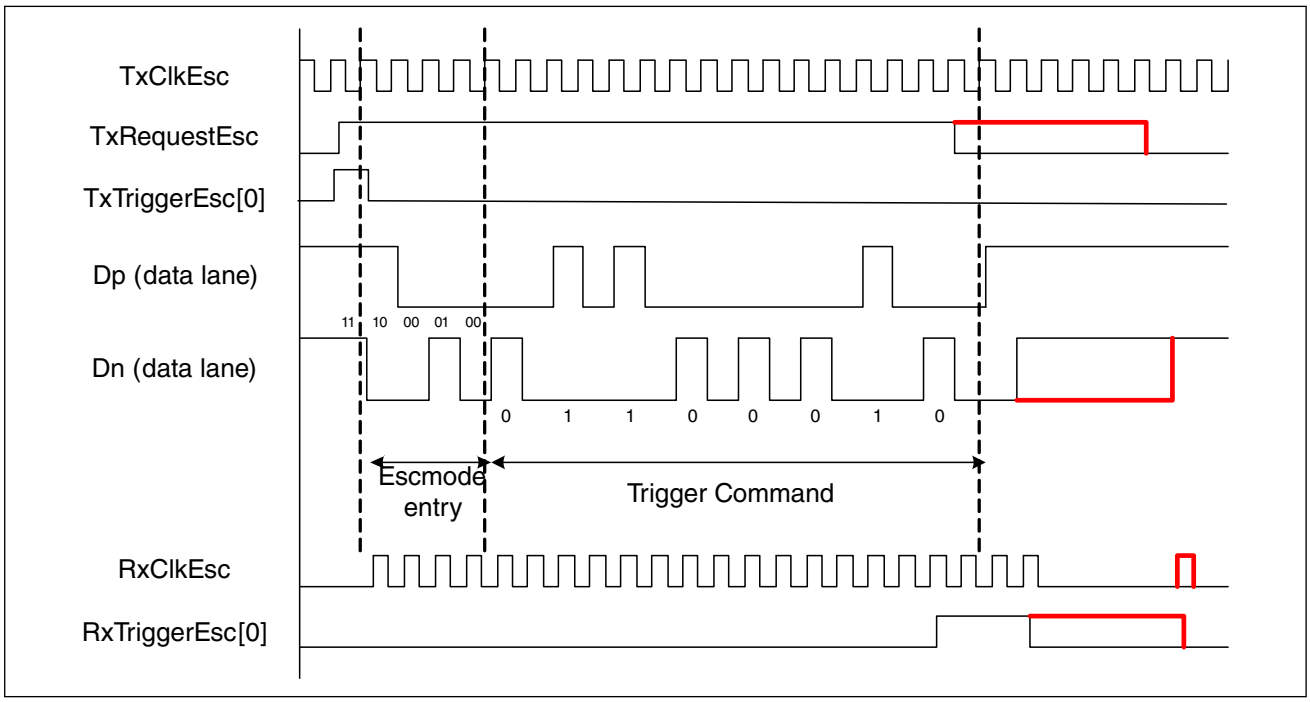

Figure 13-48. Diagram of trigger function "Remote Reset"

There are four types of trigger commands:

- 01100010 : remote reset – forward direction
- 01011101 : Tearing Effect – reverse direction
- 00100001 : Acknowledge – reverse direction
- 10100000 : Unknown

If DSI D-PHY received these signals, D-PHY indicates trigger function to protocol layer.

13.6.2.7.5.5 Turn-around and low power data receiving

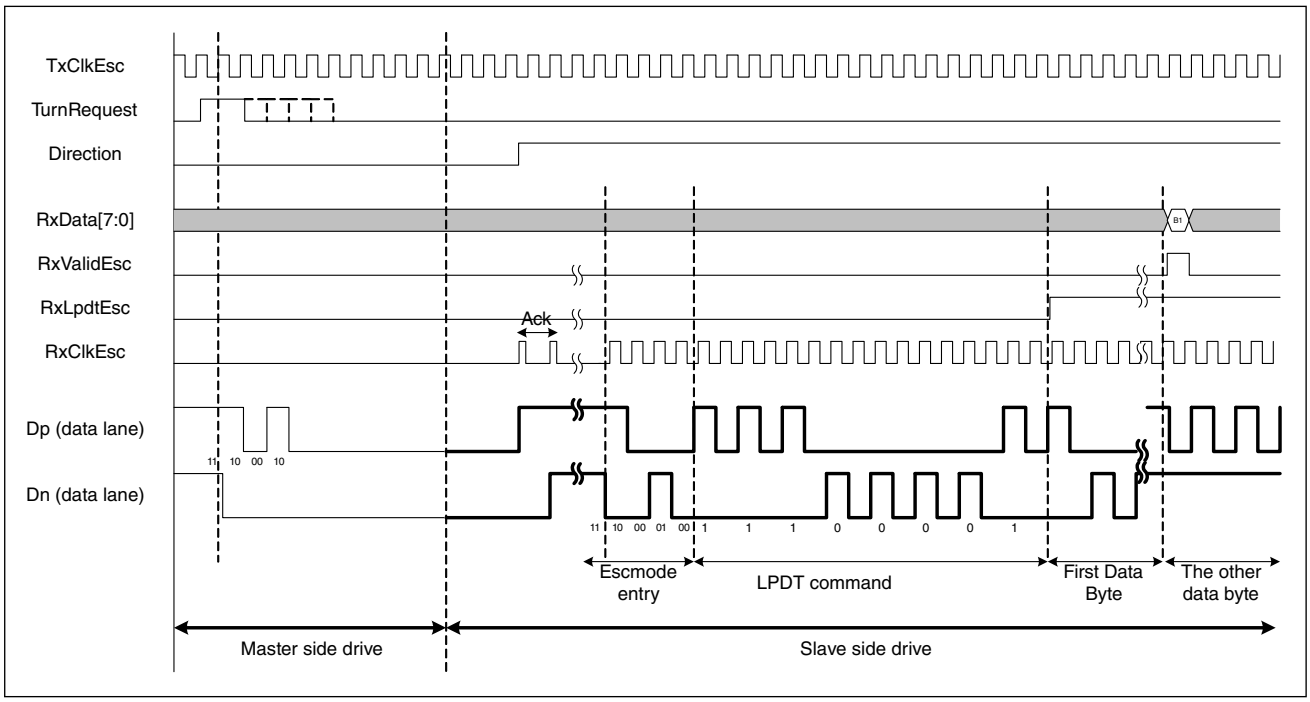

Figure 13-49. Timing diagram of Bus-Turn-Around

13.6.2.7.5.6 Tearing Effect (TE) signaling

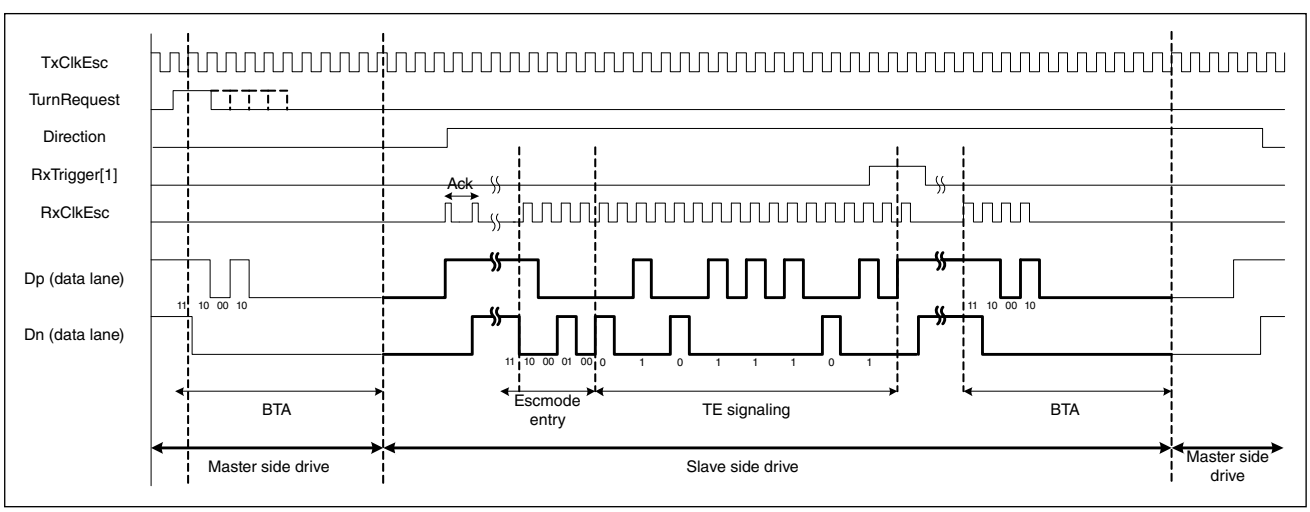

Figure 13-50. TE signaling

13.6.2.8 Configuration and Modes

13.6.2.8.1 Video mode VS Command mode

MIPI DSI Master Block supports two modes, namely, Video mode and Command mode.

Command mode uses RGB interface and S-i80 interface. Mode can change via SFRs.

13.6.2.8.2 Single display

For single display configuration, use video mode or command mode.

13.6.2.8.3 PLL

To transmit Image data, MIPI DSI Master Block needs high frequency clock (80MHz ~ 1GHz) generated by PLL.

To configure PLL, MIPI DSI Master comprises of SFRs and corresponding interface signals. PLL is embedded in PHY module.

13.6.2.8.4 Buffer

In MIPI DSI standard specification, DSI Master sends image stream in burst mode. The image stream transmits in high-speed and bit-clock frequency. This mode allows the device to stay in stop state longer to reduce power consumption. For this mode, MIPI DSI Master has a line buffer to store one complete line and send it faster at the next line time.

13.6.3 Clocks

The table below shows the clocks described in this module:

Table 13-23. Clocks

Clocks	Description
PCLK	APB Clock This signal represents the output clock domain in RX_FIFO module.

13.6.4 Reset

There is software reset register DSI_SWRST, with register bits: Software reset and Function reset that resets all FF in MIPI DSI. DSI_INTSRC[SwRstRelease] and DSI_INTMSK[MskSwRstRelease] are two register release bits that releases software reset.

There is a remote reset trigger function specified while configuring MIPI DSI master. It is set using DSI_ESCMODE[TxTriggerRst] register bit and is cleared automatically post the trigger operation.

MIPI DSI has a status bit, DSI_STATUS[SwRstRls] which specifies the software reset status. Please refer to the MIPI_DSI register descriptions for more information.

13.6.5 Interrupts

The interrupt source register DSI_INTSRC, identifies various interrupt sources. The clock stable bit in the interrupt source register, PllStable is set when the timer value in PLL timer register reads 0x00000000. DSI_INTMSK is an interrupt mask register that masks the interrupt sources. The register bits in the interrupt source register are set even if the corresponding bits in DS_INTMSK are masked off by the interrupt mask register.

13.6.6 External Signals

Table 13-24. External Signals

Signal	Description	Direction
CLK_N	Negative MIPI Rx Differential Clock	I
CLK_P	Positive MIPI Rx Differential Clock	I
Dn_N	Negative MIPI Rx Differential Data	I
Dn_P	Positive MIPI Rx Differential Data	I

13.6.7 Initialization

13.6.7.1 Initialization after power-on / reset

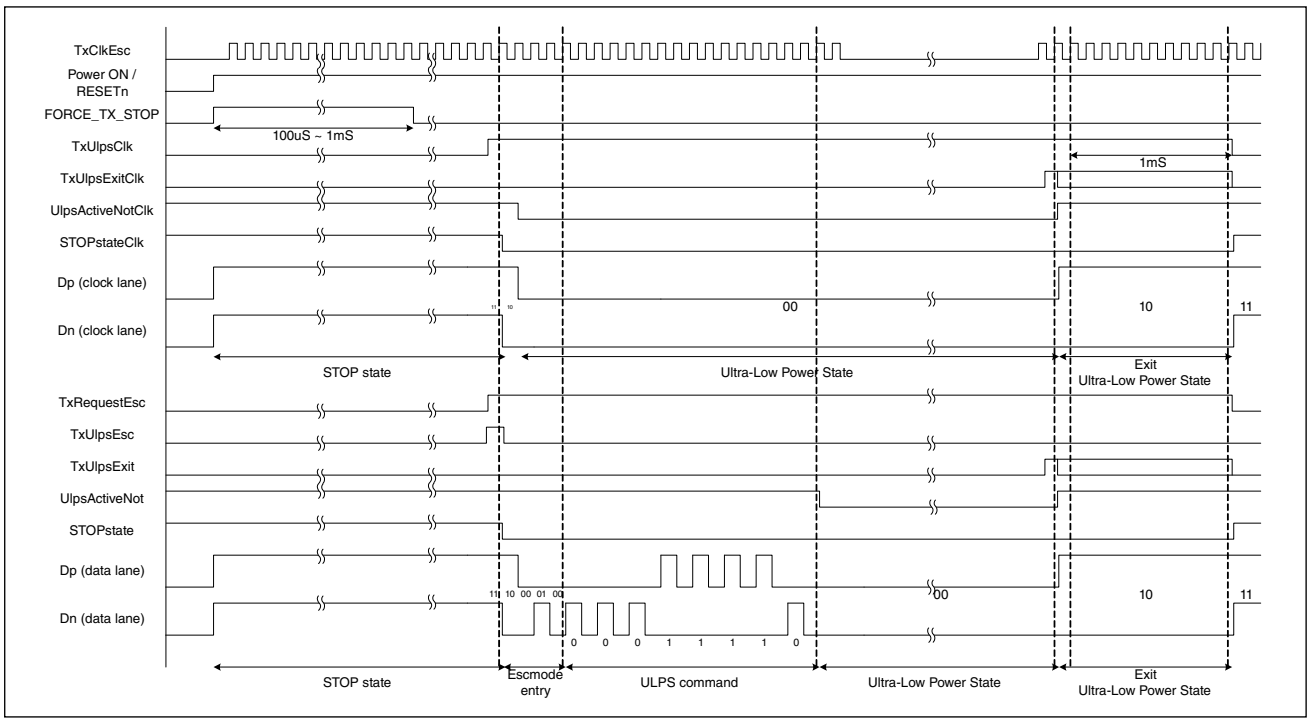

Figure 13-51. Timing diagram of initialization

13.6.8 Application Information

13.6.8.1 Display mode

13.6.8.1.1 Video mode

Video mode starting sequence:

1. Set RGB I/F in Display Controller(RGB888), also set Video mode at MIPI DSI Master.
2. Configure all parameters for displaying image (define resolution, back porch, front porch, data lane number, HS clock frequency(byte clock), etc).
3. Start image transmission.

13.6.8.1.2 Command mode

Command mode starting sequence:

1. Set S-i80 I/F in Display Controller (RGB888), also set Command mode at MIPI DSI Master.
2. Configure all parameters for displaying image.

3. Set the command at MIPI DSI registers using MIPI DCS.
4. S-i80 I/F is just used to transmit image data. The users have to read display peripheral status and write command through MIPI DSI registers.

13.6.8.2 Programming Model

Table 13-25. Behavior programming each case

No.	Mode	Case	Pseudo Code

1	Video	Initialize	1. reset or power on
			2. SFR_Write(Display Controller_registers, RGB I/F_888);
			3. SFR_Write(DSI_CLKCTRL,{16'h1000,Esc_prescaler}); //EscClk = ByteClk/Esc_prescaler;
			4. SFR_Write(DSI_MDRESOL,{M_vert,M_horizon});
			5. SFR_Write(DSI_MVPORCH,M_Vback);
			6. SFR_Write(DSI_MHPORCH,{M_Hfront,M_Hback});
			7. SFR_Write(DSI_MSYNC,{M_VSA,M_HSA}); // In SyncEvent mode, Ignore it
			8. SFR_Write(DSIM_CONFIG,{HFPdismode, MPix, Sync_inform,BLLP,Burst, Videomode(1),NumofDatlane,Lane_EN); // set the value of each bit
			9. SFR_Write(DSI_PLLCTRL, {4'h0, Freq_band,4'h8,PMS}); // PLL enable
			10. Wait for 100uS ~ 1mS using system timer after reset or power on.
			In this time, ForceSTOPstate at DSIM_CONFIG is assigned to D-PHY by default.
			100uS ~ 1mS is not mandatory. Please see the DSI slave spec.
			11. SFR_Write(DSI_CONFIG, ForceSTOPstate(0)); // disable
			12. while(~SFR_Read(DSI_STATUS, StopstateClk, StopstateDat));
			D-PHY & protocol layer(MIPI DSI Master block) in STOP state
			13. SFR_Write(DSI_ESCMODE, TxUlps(1),TxUlpsClk(1));
			D-PHY & protocol layer(MIPI DSI Master block) in ULPS
			In ULPS, User can turn off Byte/Esc clock for Low power estimation
			SFR_Write(DSI_CLKCTRL, ESCClk_EN(0), BytClk_En(0));
			Or
			SFR_Write(DSI_CLKCTRL,ByteClk_EN(0),Lane_EscClkEn[4 :0](0));
			If user wants to turn on display, Turn on EscClk and
			14. SFR_Write(DSI_ESCMODE, TxUlpsExit(1),TxUlpsClkExit(1));
			15. while(~SFR_Read(DSI_STATUS, UlpsClk, UlpsDat));
			16. SFR_Write(DSI_ESCMODE, TxUlpsExit(0), TxUlpsClkExit(0));
			17. Wait for about 1mS using system timer.
			1mS is not mandatory, just an example. Please see the DSI slave spec.
			18. SFR_Write(DSI_ESCMODE, TxUlps(0),TxUlpsClk(0));
			19. while(~SFR_Read(DSI_STATUS, StopstateClk, StopstateDat));
			D-PHY & protocol layer(MIPI DSI Master block) in STOP state

Table continues on the next page...

Table 13-25. Behavior programming each case (continued)

			20. MIPI DSI Master is ready for HS/LP operation.
2	Video	HS Data Transfer	In Video mode, there is no pseudo code. After initializing, SFR_Write(Display Controller_register, START); If line image is full in line buffer, MIPI DSI master transmit data through long data packet. If user wants to send general command to display from memory, user will have to set following sequence. 1. SFR_Write(DSI_PAYLOAD,PAYLOAD_DATA); 2. SFR_Write(DSI_PKTHDR,PKTHDR_DATA);
3	Video	LP Data Transfer	If user wants to send general command to display from memory via LPDT: 1. SFR_Write(DSI_ESCMODE, TxLpdt); 2. If DSIM transfer data in HS mode, DSIM will wait STOPstate and transfer mode change HS to LP. 3. same as the previous test scenario cases.
4	Video	ULPS	ULPS sequence is same the initialization process (test scenario #1), 13~20
5	Video	Trigger function	The process is as follows: 1. SFR_Write(DSI_ESCMODE, TxTriggerRst); 2. If DSI master state is not STOP state, DSIM will wait for LP stop mode and transmit trigger automatically.
6	Video	BTA	There are two cases of BTA. One case is after transferring general read data packet or DCS command write(set_tear_on) and the other one is BTA_req bit setting by software. Previous case is automatically setting BTA. Next case is as follows: If user reads the state or data of display panel, user will use BTA. 1. SFR_Write(DSI_ESCMODE, BTA); 2. If DSIM transfer data, DSIM will wait STOPstate. 3. After BTA assert, DSIM release DSI channel. In reverse direction (DSI slave has DSI channel grant), all DSIM FIFO is flushed and masked Video/SFR inputs. Only LPRX data input is unmasked. 4. If DSIS releases DSI channel to DSIM, Int_BusTurnOver is generated. After ISR, DSIM can transfer data.

7	Command	Initialize	1. reset or power on
			2. SFR_Write(Display Controller_registers, S-i80 I/F_888);
			3. SFR_Write(DSI_CLKCTRL,{16'h1000,Esc_prescaler});
			4. SFR_Write(DSI_MDRESOL,{M_vert,M_horizon});
			6. SFR_Write(DSI_CONFIG,{MPix, Sync_inform,NumofDatlane,Videomode(0), Lane_EN); // set the value of each bit
			7. SFR_Write(DSI_PLLCTRL, {4'h0, Freq_band,4'h8,PMS}); // PLL enable
			8. Wait for 100uS ~ 1mS using system timer after reset or power on. In this time, ForceSTOPstate at DSIM_CONFIG is assigned to D-PHY by default. 100uS ~ 1mS is not mandatory. Please see the DSI slave spec.

Table 13-25. Behavior programming each case (continued)

			Turn on Display Controller for Image transfer
9	Command	LP Data Transfer	If user wants to send general command to display from memory via LPDT. SFR_Write(DSI_ESCMODE, TxLpdt); If DSIM transfer data in HS mode, DSIM will wait STOPstate and transfer mode change HS to LP. same as the previous test scenario cases.
10	Command	ULPS	ULPS sequence is same the initialization process (test scenario #1), 13~20
11	Command	Trigger function	The process is as follows: SFR_Write(DSI_ESCMODE, TxTriggerRst); If DSI master state is not STOP state, DSIM will wait for LP stop mode and transmit trigger automatically.
12	Command	BTA	There are two cases of BTA. One case is after transferring general read data packet or DCS command write(set_tear_on) and the other one is BTA_req bit setting by software. Previous case is automatically setting BTA. Next case is as follows: If user read the state or data of display panel, user will use BTA. SFR_Write(DSI_ESCMODE, BTA); If DSIM transfer data, DSIM will wait STOPstate. After BTA assert, DSIM release DSI channel. In reverse direction (DSI slave has DSI channel grant), all DSIM FIFO is flushed and masked Video/SFR inputs. Only LPRX data input is unmasked. If DSIS releases DSI channel to DSIM, “Int_BusTurnOver” is generated. After ISR, DSIM can transfer data.

13	ISR
	(Error)
			SFR_Write(Global_INTC_MASK, INTMASK(DSIM));
			SFR_Read(Global_INTC_SRC);
			SFR_Write(DSI_INTMSK, all_int_mask);
			SFR_Read(DSI_INTSRC);
			Error reporting to application layer
			SFR_Write(DSI_INTSRC, intsrc); // clear interrupt source
			SFR_Write(DSI_INTMSK, all_int_unmask);
			SFR_Write(Global_INT_SRC, intsrc); // clear interrupt source
			SFR_Write(Global_INT_MASK, INTUNMASK(DSIM));
			SFR_Write(DSI_CONFIG, ForceSTOPstate(1));
			enough time later
			SFR_Write(DSI_CONFIG, ForceSTOPstate(0));

14	ISR (Rx Data)		After BTA, wait interrupt “Int_BusTurnOver”. The process is as follows: SFR_Write(Global_INTC_MASK, INTMASK(DSIM)); SFR_Read(Global_INTC_SRC); SFR_Write(DSI_INTMSK, all_int_mask); SFR_Read(DSI_INTSRC);

Table continues on the next page...

Table 13-25. Behavior programming each case (continued)

			SFR_Write(DSI_INTSRC, {BusTurnOver,RxDone}); // clear interrupt source
			SFR_Write(DSI_INTMSK, all_int_unmask);
			SFR_Write(Global_INT_SRC, intsrc); // clear interrupt source
			SFR_Write(Global_INT_MASK, INTUNMASK(DSIM));
			SFR_Read(DSI_RXFIFO);

15	ISR
	(trigger flag)
			After BTA, wait interrupt “Int_BusTurnOver”. The process is as follows:
			SFR_Write(Global_INTC_MASK, INTMASK(DSIM));
			SFR_Read(Global_INTC_SRC);
			SFR_Write(DSI_INTMSK, all_int_mask);
			SFR_Read(DSI_INTSRC);
			flag reporting to application layer
			SFR_Write(DSI_INTSRC, {BusTurnOver, trigflags}); // clear interrupt source
			SFR_Write(DSI_INTMSK, all_int_unmask);
			SFR_Write(Global_INT_SRC, intsrc); // clear interrupt source
			SFR_Write(Global_INT_MASK, INTUNMASK(DSIM));

16	Software reset	Function reset	If you want to assert Software reset, all clocks must be turned on because software reset is a synchronous reset. Turn on RGB_VCLK only from Display controller SFR_Write(DSI_PLLTMR, PllTimer); SFR_Write(DSI_CLKCTRL, {EscClkEn, EscPrescaler}); SFR_Write(DSI_PLLCTRL, {PllEn,PMS}); wait Pll stable (polling status register or ISR) SFR_Write(DSI_SWRST, FuncRst); wait for software reset release (polling status register or ISR) ready for operation
		Software reset	If you want to assert Software reset, all clocks must be turned on because software reset is synchronous reset. Turn on RGB_VCLK only from Display controller SFR_Write(DSI_PLLTMR, PllTimer); SFR_Write(DSI_CLKCTRL, {EscClkEn, EscPrescaler}); SFR_Write(DSI_PLLCTRL, {PllEn,PMS}); wait Pll stable (polling status register or ISR) SFR_Write(DSI_SWRST, SwRst); wait software reset release (polling status register or ISR) re-configure all registers ready for operation
17	Clock source changing from PLL to external		Turn on RGB_VCLK(only clock) from Display controller and STOP data inputting to MIPI DSIM SFR_Write(DSI_SWRST, FuncRst); or SFR_Write(DSIM_SWRST, SwRst); Turn off any inputs in MIPI DSIM.

Table continues on the next page...

Table 13-25. Behavior programming each case (continued)

	clock source		SFR_Write(DSI_PLLCTRL, PLL disable); SRF_Write(DSI_CLKCTRL, ByteClkSel); SFR_Write(DSI_SWRST, FuncRst); or SFR_Write(DSIM_SWRST, SwRst); reconfiguration Turn on Display controller or input data to MIPI DSIM ready for operation
18	Usage of EoT packet when user wants to transfer command packet through HS mode.		Video mode after turning on display controller FSM of Display controller I/F of MIPI DSIM generates EoT packet automatically Just write command or general packet in SFR FIFO Video mode after turning off/before turning on display controller Write command or general packet in SFR FIFO If user does not want to transfer general or command packet, user should write EoT packet in SFR FIFO. If general or command packets are transferred through LP mode, previous programming step is "don't care".

13.6.9 Register Map

This section includes the MIPI DSI module memory map and detailed descriptions of the registers.

13.6.9.1 MIPI_DSI register descriptions

13.6.9.1.1 MIPI_DSI memory map

MIPI_DSI base address: 32E6_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h	Specifies the DSI version register. (DSI_VERSION)	32	RO	0106_0100h
4h	Specifies the status register. (DSI_STATUS)	32	RO	0010_010Fh
8h	Specifies the RGB FSM status register. (DSI_RGB_STATUS)	32	RO	0000_0001h
Ch	Specifies the software reset register. (DSI_SWRST)	32	RW	0000_0000h
10h	Specifies the clock control register. (DSI_CLKCTRL)	32	RW	0000_FFFFh
14h	Specifies the time out register. (DSI_TIMEOUT)	32	RW	00FF_FFFFh
18h	Specifies the configuration register. (DSI_CONFIG)	32	RW	0200_0000h

Table continues on the next page...

Offset	Register	Width (In bits)	Access	Reset value
1Ch	Specifies the escape mode register. (DSI_ESCMODE)	32	RW	0000_0000h
20h	Specifies the main display image resolution register. (DSI_MDRESOL)	32	RW	0300_0400h
24h	Specifies the main display Vporch register. (DSI_MVPORCH)	32	RW	F000_0000h
28h	Specifies the main display Hporch register. (DSI_MHPORCH)	32	RW	0000_0000h
2Ch	Specifies the main display Sync Area register. (DSI_MSYNC)	32	RW	0000_0000h
30h	Specifies the sub display image resolution register. (DSI_SDRESOL)	32	RW	0300_0400h
34h	Specifies the interrupt source register. (DSI_INTSRC)	32	RW	0000_0000h
38h	Specifies the interrupt mask register. (DSI_INTMSK)	32	RW	BB37_FFFFh
3Ch	Specifies the packet header FIFO register. (DSI_PKTHDR)	32	WO	0000_0000h
40h	Specifies the payload FIFO register. (DSI_PAYLOAD)	32	WO	0000_0000h
44h	Specifies the read FIFO register. (DSI_RXFIFO)	32	RO	Table 13-112
48h	Specifies the FIFO threshold level register. (DSI_FIFOTHLD)	32	RW	0000_01FFh
4Ch	Specifies the FIFO status and control register. (DSI_FIFOCTRL)	32	RW	0155_551Fh
50h	Specifies the FIFO memory AC characteristic register. (DSI_MEMACCHR)	32	RW	0000_4040h
78h	Specifies the Multi Packet, Packet Go register. (DSI_MULTI_PKT)	32	RW	0000_0002h
90h	Specifies the 1Gbps D-PHY PLL control register. (DSI_PLLCTRL_1G)	32	RW	0000_0000h
94h	Specifies the PLL control register. (DSI_PLLCTRL)	32	RW	0000_0000h
98h	Specifies the PLL control register 1. (DSI_PLLCTRL1)	32	RW	0000_0000h
9Ch	Specifies the PLL control register 2. (DSI_PLLCTRL2)	32	RW	0000_0000h
A0h	Specifies the PLL timer register. (DSI_PLLTMR)	32	RW	FFFF_FFFFh
A4h	Specifies the D-PHY control register 1. (DSI_PHYCTRL_B1)	32	RW	0000_0000h
A8h	Specifies the D-PHY control register 2. (DSI_PHYCTRL_B2)	32	RW	0000_0000h
ACh	Specifies the D-PHY control register 1. (DSI_PHYCTRL_M1)	32	RW	0000_0000h
B0h	Specifies the D-PHY control register 2. (DSI_PHYCTRL_M2)	32	RW	0000_0000h
B4h	Specifies the D-PHY timing register. (DSI_PHYTIMING)	32	RW	0000_0000h
B8h	Specifies the D-PHY timing register 1. (DSI_PHYTIMING1)	32	RW	0000_0000h
BCh	Specifies the D-PHY timing register 2. (DSI_PHYTIMING2)	32	RW	0000_0000h

13.6.9.1.2 Specifies the DSI version register. (DSI_VERSION)

13.6.9.1.2.1 Offset

Register	Offset
DSI_VERSION	0h

13.6.9.1.2.2 Function

Specifies the DSI version register.

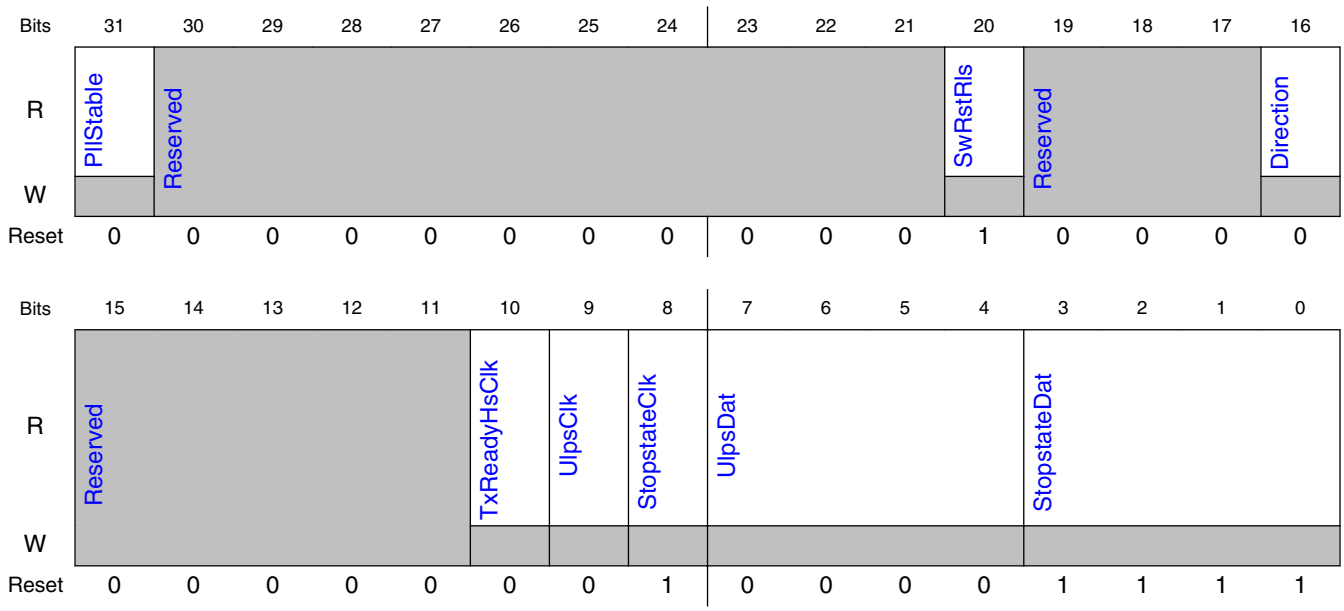
13.6.9.1.2.4 Fields

Field	Function
31-0 Version	Specifies the DSI version information

13.6.9.1.3 Specifies the status register. (DSI_STATUS)



13.6.9.1.3.1 Offset

Register	Offset
DSI_STATUS	4h

13.6.9.1.3.2 Function

This register reads and checks internal and interface status. It also checks FSM status, Line buffer status, current image line number, and so on.

13.6.9.1.3.3 Diagram

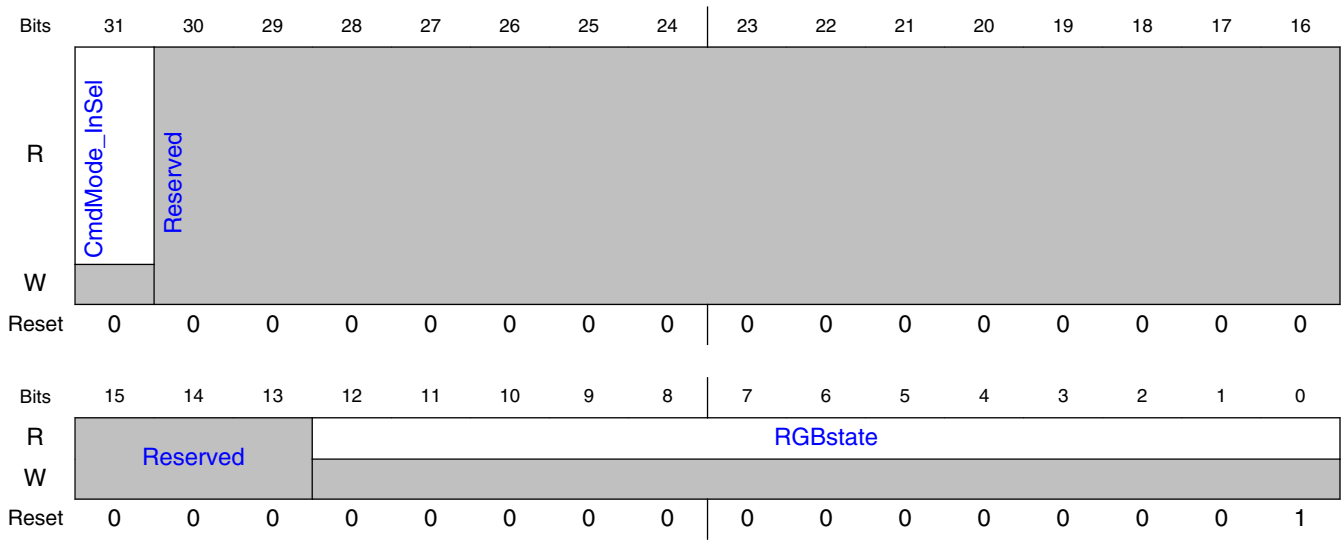
13.6.9.1.3.4 Fields

Field	Function
31 PllStable	D-phy pll generates stable byteclk.
30-21 —	Reserved
20 SwRstRls	Specifies the software reset status. 0 = Reset state 1 = Release state
19-17 —	Reserved
16 Direction	Specifies the data direction indicator. 0 = Forward direction 1 = Backward direction
15-11 —	Reserved
10 TxReadyHsClk	Specifies the HS clock ready at clock lane. 0 = Not ready for transmitting HS data at clock lane 1 = Ready for transmitting HS data at clock lane
9 UlpsClk	Specifies the ULPS indicator at clock lane. 0 = No ULPS in clock lane 1 = ULSP in clock lane

Table continues on the next page...

Field	Function
8 StopstateClk	Specifies the stop state indicator at clock lane. 0 = No stop state in clock lane 1 = Stop state in clock lane
7-4 UlpsDat	Specifies the ULPS indicator at data lanes. UlpsDat[0]: Data lane 0 UlpsDat[1]: Data lane 1 UlpsDat[2]: Data lane 2 UlpsDat[3]: Data lane 3 0 = No ULPS in each data lane 1 = ULPS in each data lane
3-0 StopstateDat	Specifies the stop state indicator at data lane. StopstateDat[0]: Data lane 0 StopstateDat[1]: Data lane 1 StopstateDat[2]: Data lane 2 StopstateDat[3]: Data lane 3 0 = No stop state in each data lane 1 = Stop state in each data lane

13.6.9.1.4 Specifies the RGB FSM status register. (DSI_RGB_STATUS)



13.6.9.1.4.1 Offset

Register	Offset
DSI_RGB_STATUS	8h

13.6.9.1.4.2 Function

Specifies the RGB FSM status register.

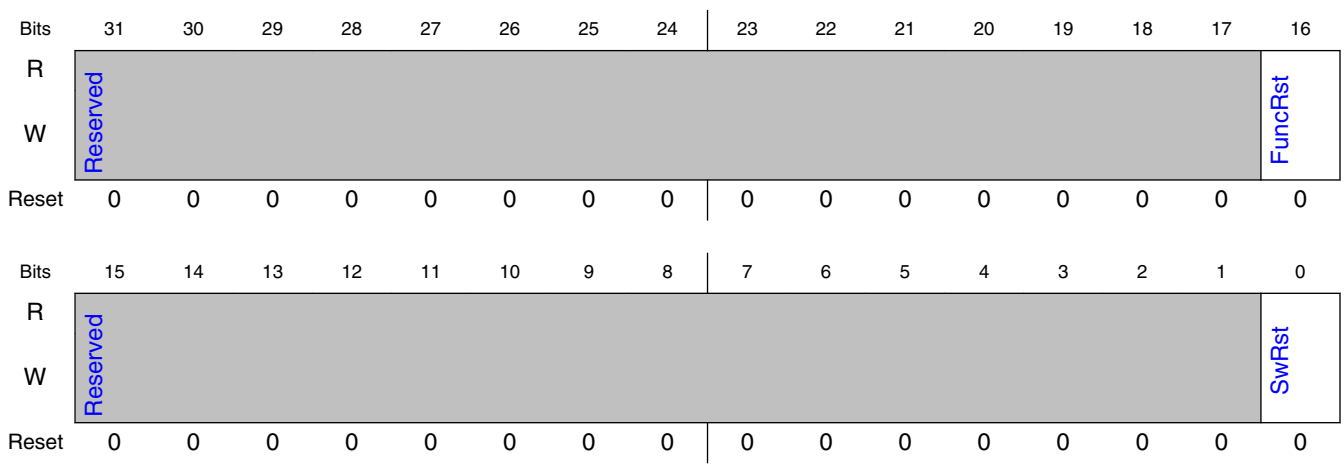
13.6.9.1.4.4 Fields

Field	Function
31 CmdMode_InSel	Specifies the command mode input selection 0 = using RGB video interface 1 = using S-i80 interface
30-13 —	Reserved
12-0 RGBstate	Specifies the RGB packetize FSM status. 0x0001 = IDLE 0x0002 = STOP 0x0004 = VSyS 0x0008 = VSE 0x0010 = HSS 0x0020 = HSA 0x0040 = HSE 0x0080 = HBP 0x0100 = RGB 0x0200 = NULL 0x0400 = HFP 0x0800 = EOT 0x1000 = NHOLD

13.6.9.1.5 Specifies the software reset register. (DSI_SWRST)



13.6.9.1.5.1 Offset

Register	Offset
DSI_SWRST	Ch

13.6.9.1.5.2 Function

Specifies the software reset register.

13.6.9.1.5.3 Diagram

13.6.9.1.5.4 Fields

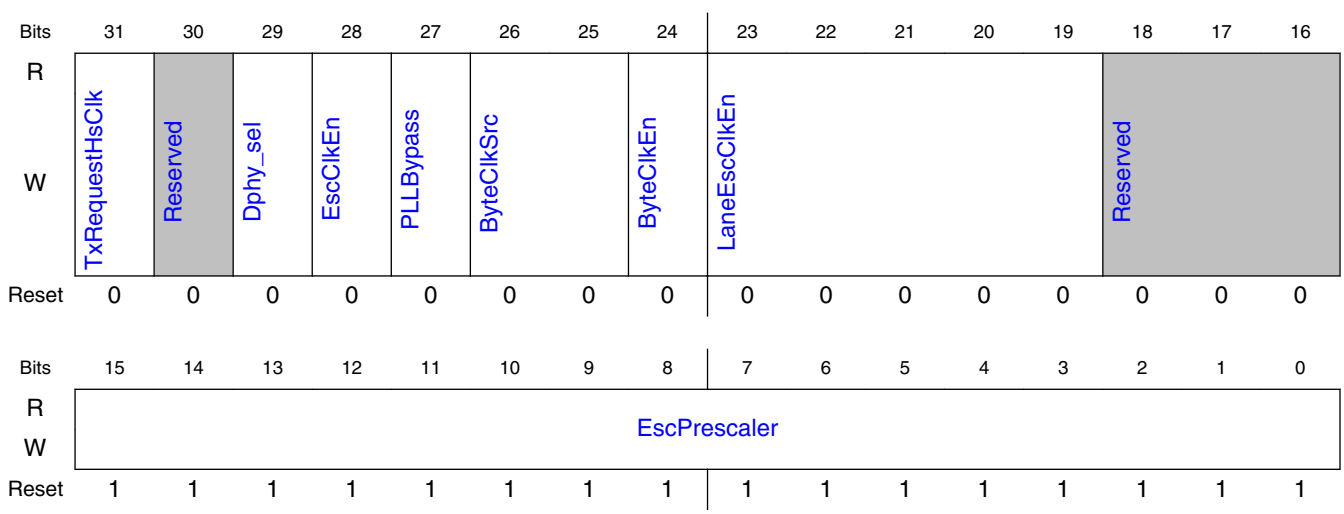
Field	Function
31-17 —	Reserved
16 FuncRst	Specifies the software reset (High active). "Function reset" resets all FF in MIPI DSI (except SFRs: STATUS, RGB_STATUS, SWRST, CLKCTRL, TIMEOUT, CONFIG, ESCMODE[1], MDRESOL, MVPORCH, MHPORCH, MSYNC, INTMSK, SDRESOL, S3D_CTL, P3D_CTL, MIC_CTL, P3D_ON_MIC_OFF_HSA, P3D_OFF_MIC_ON_HSA, P3D_ON_MIC_ON_HSA, P3D_ON_MIC_OFF_HFP, P3D_OFF_MIC_ON_HFP, P3D_ON_MIC_ON_HFP, MULTI_PKT, FIFOTHLD, FIFOCTRL, [2], MEMACCHR, PLLCTRL, PLLTMR, PHYACCHR, and VERINFORM). 0 = Standby 1 = Reset
15-1	Reserved

Table continues on the next page...

Field	Function
—	
0 SwRst	Specifies the software reset (High active). “Software reset” resets all FF in MIPI DSI (except some SFRs: STATUS, SWRST, CLKCTRL, PLLCTRL, PLLTMR, PHYTUNE and VERINFORM). 0 = Standby 1 = Reset

1. ForceStopstate, CmdLpdt, TxLpdt
2. nInitRx, nInitSfr, nInitI80, nInitSub, nInitMD

13.6.9.1.6 Specifies the clock control register. (DSI_CLKCTRL)



13.6.9.1.6.1 Offset

Register	Offset
DSI_CLKCTRL	10h

13.6.9.1.6.2 Function

Specifies the clock control register.

13.6.9.1.6.3 Diagram

13.6.9.1.6.4 Fields

Field	Function
31 TxRequestHsClk	Specifies the HS clock request for HS transfer at clock lane (Turn on HS clock)
30 —	Reserved
29 Dphy_sel	D-PHY select 0 = 1.5Gbps D-PHY (default) 1 = 1Gbps D-PHY
28 EscClkEn	Enables the escape clock generating prescaler. 0 = Disables 1 = Enables
27 PLLBypass	Sets the PLLBypass signal connected to D-PHY module input for selecting clock source bit. 0 = PLL output 1 = External Serial clock This bit must be set to 0.
26-25 ByteClkSrc	Selects byte clock source. (It must be 2'b00.) 00 = D-PHY PLL (default). PLL_out clock is used to generate ByteClk by dividing 8.
24 ByteClkEn	Enables byte clock. 0 = Disables 1 = Enables
23-19 LaneEscClkEn	Enables escape clock for D-phy lane. LaneEscClkEn[0] = Clock lane LaneEscClkEn[1] = Data lane 0 LaneEscClkEn[2] = Data lane 1 LaneEscClkEn[3] = Data lane 2 LaneEscClkEn[4] = Data lane 3 0 = Disables 1 = Enables
18-16 —	Reserved
15-0 EscPrescaler	Specifies the escape clock prescaler value. The escape clock frequency range varies up to 20MHz. **NOTE:** The requirement for BTA is that the Host Escclk frequency should range between 66.7 ~ 150% of the peripheral escape clock frequency. EscClk = ByteClk / (EscPrescaler)

13.6.9.1.7 Specifies the time out register. (DSI_TIMEOUT)

13.6.9.1.7.1 Offset

Register	Offset
DSI_TIMEOUT	14h

13.6.9.1.7.2 Function

Specifies the time out register.

13.6.9.1.7.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved								BtaTout

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	LpdrTout															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

13.6.9.1.7.4 Fields

Field	Function
31-24 —	Reserved
23-16 BtaTout	Specifies the timer for BTA. This register specifies time out from BTA request to change the direction with respect to Tx escape clock.
15-0 LpdrTout	Specifies the timer for LP Rx mode timeout. This register specifies time out on how long RxValid deasserts, after RxLpdt asserts with respect to Tx escape clock. RxValid specifies Rx data valid indicator. RxLpdt specifies an indicator that D-phy is under RxLpdt mode. RxValid and RxLpdt specifies signal from D-phy.

13.6.9.1.8 Specifies the configuration register. (DSI_CONFIG)

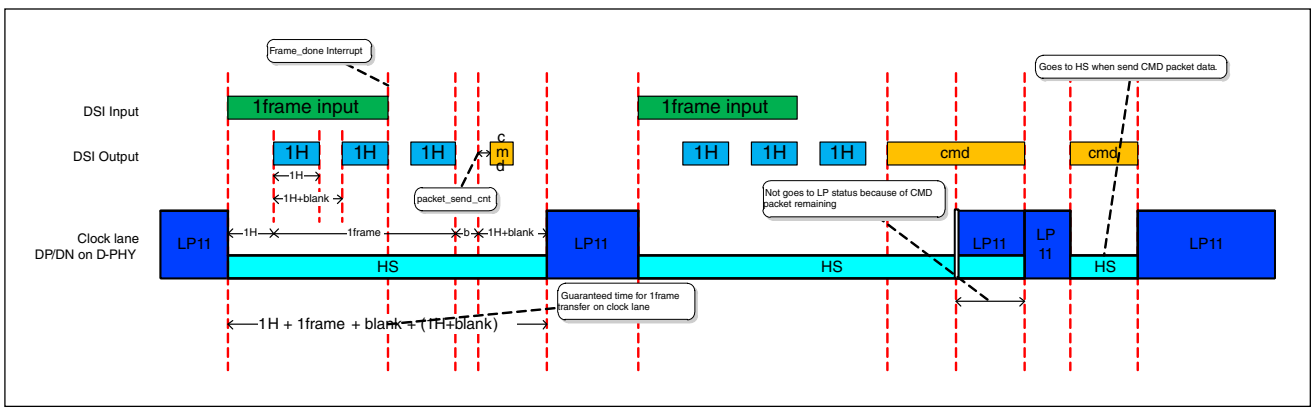
13.6.9.1.8.1 Offset

Register	Offset
DSI_CONFIG	18h

13.6.9.1.8.2 Function

This register configures MIPI DSI master such as data lane number, input interface, porch area, frame rate, BTA, LPDT, ULPS, and so on.

The figure below shows the timing diagram of the clock lane:



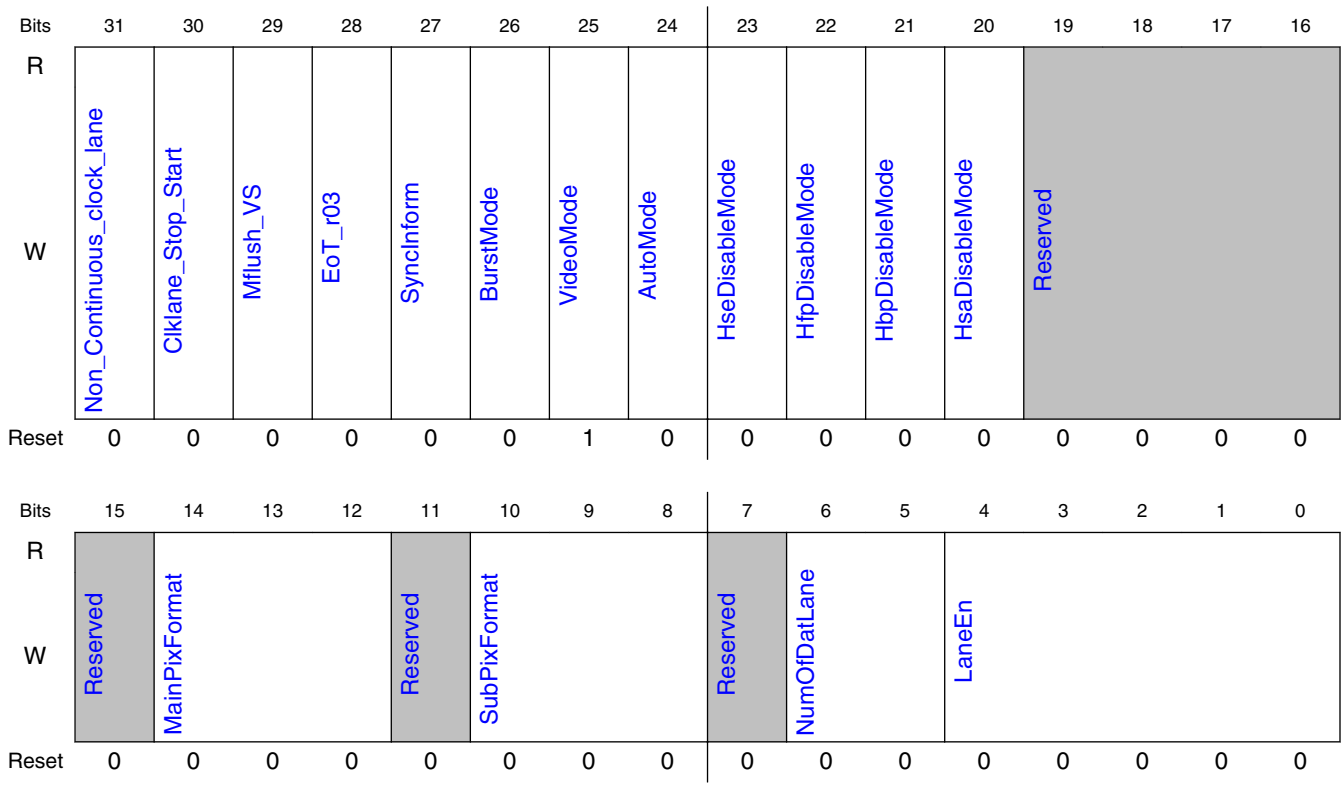


Figure 13-52. Non-continuous clock lane timing diagram

13.6.9.1.8.3 Diagram

13.6.9.1.8.4 Fields

Field	Function
31 Non_Continuous_clock_lane	Non-continuous clock mode. This feature is D-PHY clock lane control DP/DN Please refer to the diagram above to view the clock lane timing diagram. Please refer to the DSI_MULTI_PKT register, which shows the configuration of count values. 0 = Disable (default) 1 = Enable
30 Clklane_Stop_Start	PHY clock lane On/Off for Electrostatic Discharge (ESD). It is operated when first HBP to second HFP in every VSYNC. This feature is not guaranteed on Command mode. 0 = Disable (default) 1 = Enable
29 Mflush_VS	Auto flush of MD FIFO using Vsync pulse. It needs that Main display FIFO should be flushed for deleting garbage data. 0 = Enable (default) 1 = Disable

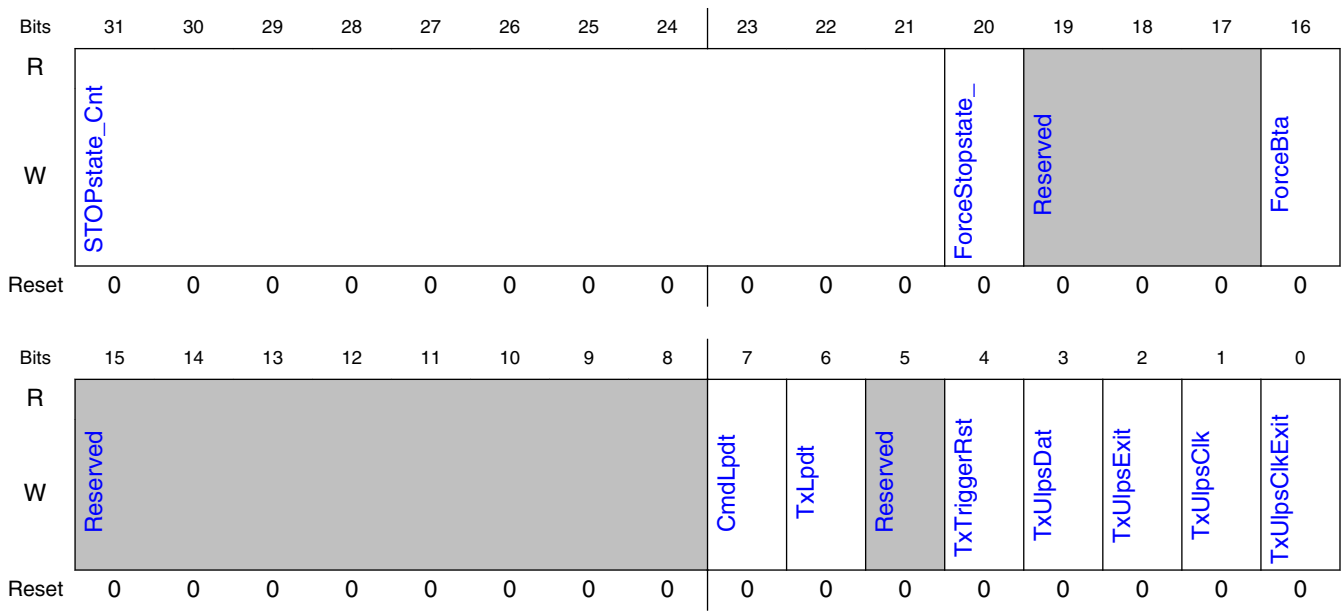
Table continues on the next page...

Field	Function
28 EoT_r03	Disables EoT packet in HS mode. 0 = Enables EoT packet generation for V1.01r11 1 = Disables EoT packet generation for V1.01r03
27 SyncInform	Selects Sync Pulse or Event mode in Video mode. 0 = Event mode (non burst, burst) 1 = Pulse mode (non burst only) In command mode, this bit is ignored.
26 BurstMode	Selects Burst mode in Video mode In Non-burst mode, RGB data area is filled with RGB data and Null packets, according to input bandwidth of RGB interface. In Burst mode, RGB data area is filled with RGB data only. 0 = Non-burst mode 1 = Burst mode In command mode, this bit is ignored.
25 VideoMode	Specifies display configuration. 0 = Command mode 1 = Video mode
24 AutoMode	Specifies auto vertical count mode. In Video mode, the vertical line transition uses line counter configured by Vertical Sync Active (VSA), VBP, and Vertical resolution. If this bit is set to '1', the line counter does not use VSA and VBP registers. 0 = Configuration mode 1 = Auto mode In command mode, this bit is ignored.
23 HseDisableMode	In Vsync pulse and Vporch area, MIPI DSI master transfers only Hsync start packet to MIPI DSI slave at MIPI DSI spec 1.1r02. This bit transfers Hsync end packet in Vsync pulse and Vporch area (optional). 0 = Disables transfer 1 = Enables transfer In command mode, this bit is ignored.
22 HfpDisableMode	Specifies HFP disable mode. If this bit set, DSI master ignores HFP area in Video mode. 0 = Enables 1 = Disables In command mode, this bit is ignored.
21 HbpDisableMode	Specifies HBP disable mode. If this bit set, DSI master ignores HBP area in Video mode. 0 = Enables 1 = Disables In command mode, this bit is ignored.
20 HsaDisableMode	Specifies HSA disable mode. If this bit set, DSI master ignores HSA area in Video mode. 0 = Enables 1 = Disables In command mode, this bit is ignored.

Table continues on the next page...

Field	Function
19-15 —	Reserved
14-12 MainPixFormat	Specifies pixel stream format for main display. 000 = 3bpp (for Command mode only) 001 = 8bpp (for Command mode only) 010 = 12bpp (for Command mode only) 011 = 16bpp (for Command mode only) 100 = 16-bit RGB (565) (for Video mode only) 101 = 18-bit RGB (666: packed pixel stream) (for Video mode only) 110 = 18-bit RGB (666: loosely packed pixel stream) for Common 111 = 24-bit RGB (888) for common
11 —	Reserved
10-8 SubPixFormat	Specifies pixel stream format for sub display. 000 = 3bpp (for Command mode only) 001 = 8bpp (for Command mode only) 010 = 12bpp (for Command mode only) 011 = 16bpp (for Command mode only) 100 = 16-bit RGB (565) (for Video mode only) 101 = 18-bit RGB (666: packed pixel stream) for Video mode only) 110 = 18-bit RGB (666: loosely packed pixel stream) for common) 111 = 24-bit RGB (888) (for Common)
7 —	Reserved
6-5 NumOfDatLane	Sets the data lane number. 00 = Data lane 0 (1 data lane) 01 = Data lane 0 ~ 1 (2 data lanes) 10 = Data lane 0 ~ 2 (3 data lanes) 11 = Data lane 0 ~ 3 (4 data lanes)
4-0 LaneEn	Enables the lane. If Lane_EN is disabled, the lane ignores input and drives initial value through output port. 0 = Lane is off. 1 = Lane is on. LaneEn[0] = Clock lane enabler LaneEn[1] = Data lane 0 enabler LaneEn[2] = Data lane 1 enabler LaneEn[3] = Data lane 2 enabler LaneEn[4] = Data lane 3 enabler

13.6.9.1.9 Specifies the escape mode register. (DSI_ESCMODE)



13.6.9.1.9.1 Offset

Register	Offset
DSI_ESCMODE	1Ch

13.6.9.1.9.2 Function

This register configures MIPI DSI master.

13.6.9.1.9.3 Diagram

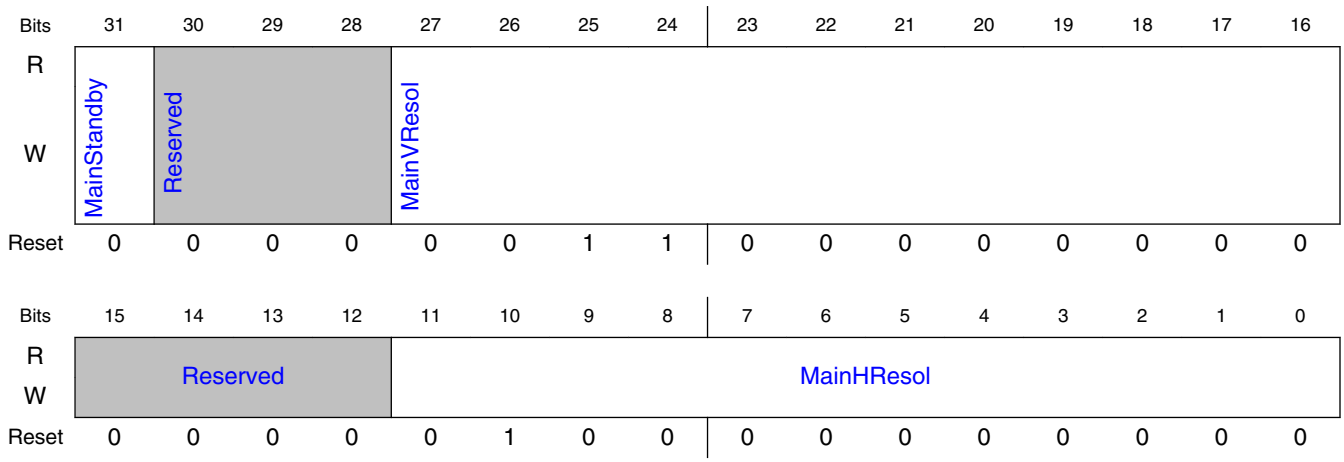
13.6.9.1.9.4 Fields

Field	Function
31-21 STOPstate_Cnt	After transmitting read packet or write “set_tear_on” command, BTA requests to D-phy automatically. This counter value specifies the interval value between transmitting read packet (or write “set_tear_on” command) and BTA request. 11'h000 = 2 EscClk 11'h001 = 2 EscClk + 1 EscClk 11'h3FF = 2 EscClk + 1023 EscClk
20	Forces Stopstate for D-PHY.

Table continues on the next page...

Field	Function
ForceStopstate_	
19-17 —	Reserved
16 ForceBta	Forces Bus Turn Around. 1 = Sends the protocol layer request to D-PHY. MIPI DSI peripheral becomes master after BTA sequence. This bit clears automatically after receiving BTA acknowledge from MIPI DSI peripheral.
15-8 —	Reserved
7 CmdLpdt	Specifies LPDT transfers command in SFR FIFO. 0 = HS Mode 1 = LP Mode
6 TxLpdt	Specifies data transmission in LP mode (all data transfer in LPDT). 0 = HS Mode 1 = LP Mode
5 —	Reserved
4 TxTriggerRst	Specifies remote reset trigger function. After trigger operation, these bits will be cleared automatically.
3 TxUlpsDat	Specifies ULPS request for data lane. Manually clears after ULPS exit.
2 TxUlpsExit	Specifies ULPS exit request for data lane. Manually clears after ULPS exit.
1 TxUlpsClk	Specifies ULPS request for clock lane. Manually clears after ULPS exit.
0 TxUlpsClkExit	Specifies ULPS exit request for clock lane. Manually clears after ULPS exit.

13.6.9.1.10 Specifies the main display image resolution register. (DSI_MDRESOL)



13.6.9.1.10.1 Offset

Register	Offset
DSI_MDRESOL	20h

13.6.9.1.10.2 Function

Specifies the main display image resolution register.

13.6.9.1.10.3 Diagram

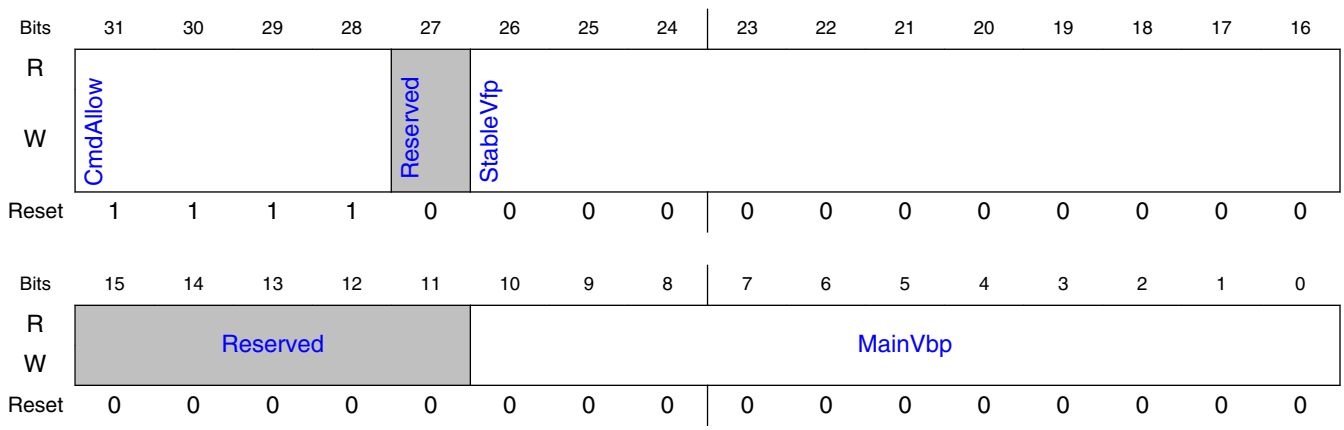
13.6.9.1.10.4 Fields

Field	Function
31 MainStandby	Specifies standby for receiving DISPCON output in Command mode after setting all configuration. 0 = Not ready 1 = Stand by Standby should be set after configuration (resolution, reqtype, pixelform, and so on) is set for command mode. In Video mode, if this bit value is 0, data is not transferred.
30-28 —	Reserved
27-16 MainVResol	Specifies Vertical resolution (1 ~ 2047).
15-12 —	Reserved
11-0 MainHResol	Specifies Horizontal resolution (1 ~ 2047).

13.6.9.1.11 Specifies the main display Vporch register. (DSI_MVPORCH)

13.6.9.1.11.1 Offset

Register	Offset
DSI_MVPORCH	24h



13.6.9.1.11.2 Function

Specifies the main display Vporch register.

NOTE

Transfers command packets after Stable VFP area. Display controller VFP lines should be set based on sum of these values: Stable VFP, command allowing area and command masked area. Please refer to Transfer general data in video mode for more information

13.6.9.1.11.3 Diagram

13.6.9.1.11.4 Fields

Field	Function
31-28 CmdAllow	Specifies the number of horizontal lines, where command packet transmission is allowed after Stable VFP period. For more information, please see Figure 13-42.
27 —	Reserved
26-16 StableVfp	Specifies the number of horizontal lines, where command packet transmission is not allowed after end of active region. For more information, please see Figure 13-42. **NOTE:** In Command mode, these bits are ignored.
15-11 —	Reserved
10-0 MainVbp	Specifies vertical back porch width for Video mode (line count). In Command mode, these bits are ignored.

13.6.9.1.12 Specifies the main display Hporch register. (DSI_MHPORCH)

13.6.9.1.12.1 Offset

Register	Offset
DSI_MHPORCH	28h

13.6.9.1.12.2 Function

Specifies the main display Hporch register.

13.6.9.1.12.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

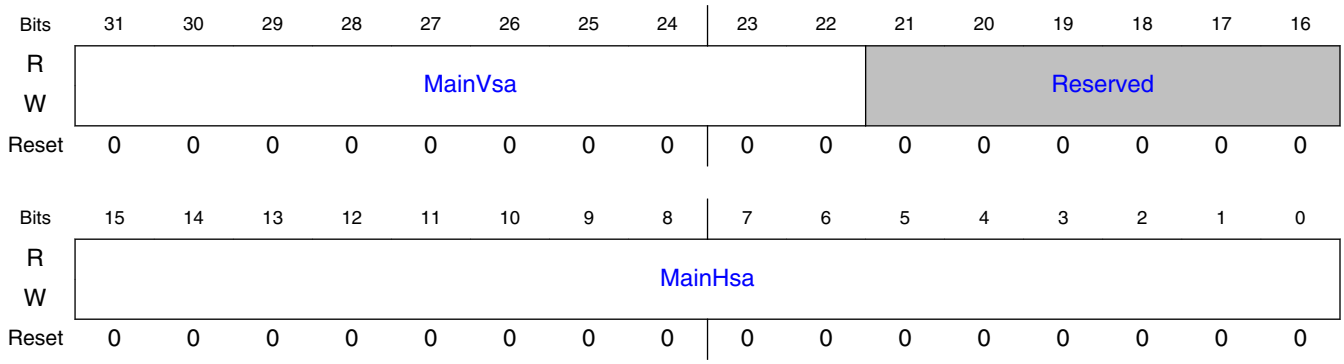
R W	MainHbp															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.6.9.1.12.4 Fields

Field	Function
31-16 MainHfp	Specifies the horizontal front porch width for Video mode. HFP is specified using blank packet. These bits specify the word counts for blank packet in HFP. In Command mode, these bits are ignored.
15-0 MainHbp	Specifies the horizontal back porch width for Video mode. HBP is specified using blank packet. These bits specify the word counts for blank packet in HBP. In Command mode, these bits are ignored.

13.6.9.1.13 Specifies the main display Sync Area register. (DSI_MSYNC)



13.6.9.1.13.1 Offset

Register	Offset
DSI_MSYNC	2Ch

13.6.9.1.13.2 Function

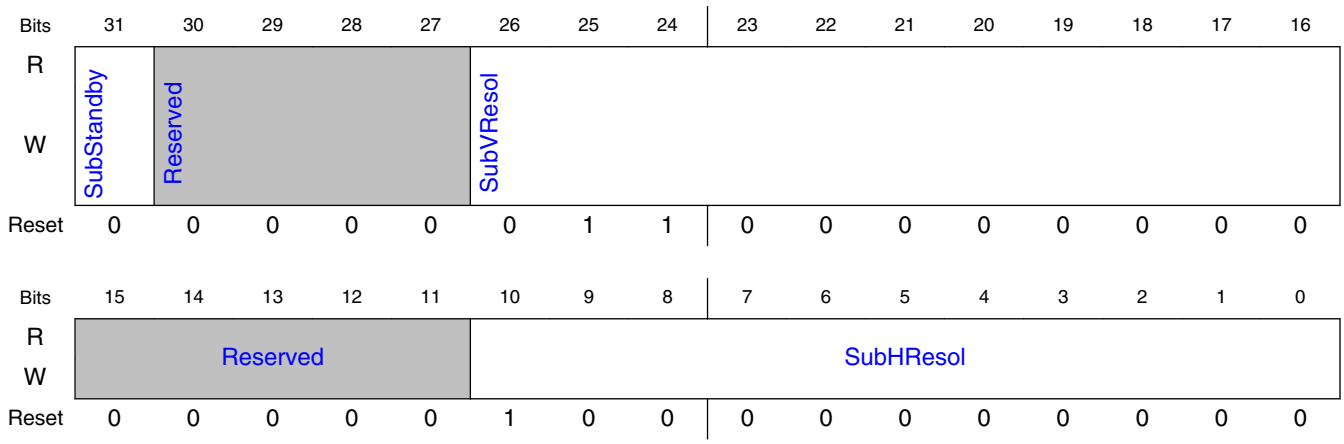
Specifies the main display Sync Area register.

13.6.9.1.13.3 Diagram

13.6.9.1.13.4 Fields

Field	Function
31-22 MainVsa	Specifies the vertical sync pulse width for Video mode (Line count). In command mode, these bits are ignored.
21-16 —	Reserved
15-0 MainHsa	Specifies the horizontal sync pulse width for Video mode. HSA is specified using blank packet. These bits specify word counts for blank packet in HSA. In command mode, these bits are ignored.

13.6.9.1.14 Specifies the sub display image resolution register. (DSI_SDRESOL)



13.6.9.1.14.1 Offset

Register	Offset
DSI_SDRESOL	30h

13.6.9.1.14.2 Function

Specifies the sub display image resolution register.

13.6.9.1.14.3 Diagram

13.6.9.1.14.4 Fields

Field	Function
31 SubStandby	Specifies standby for receiving DISPCON output in Command mode after setting all configuration. 0 = Not ready 1 = Standby Standby should be set after configuration (resolution, reqtype, pixelform, and so on) is set for command mode. In Video mode, this bit is ignored.
30-27 —	Reserved
26-16 SubVResol	Specifies the Vertical resolution (1 ~ 1024).
15-11 —	Reserved
10-0 SubHResol	Specifies the Horizontal resolution (1 ~ 1024).

13.6.9.1.15 Specifies the interrupt source register. (DSI_INTSRC)

13.6.9.1.15.1 Offset

Register	Offset
DSI_INTSRC	34h

13.6.9.1.15.2 Function

This register identifies interrupt sources. Internal block error, data transmit interrupt, inter-layer (D_PHY) error, etc.

The bits are set even if they are masked off by DSI_INTMSK_REG.

Write '1' to clear the Interrupt.

13.6.9.1.15.3 Diagram

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.6.9.1.15.4 Fields

Field	Function
31 PllStable	Indicates that D-phy PLL is stable.
30 SwRstRelease	Releases the software reset.
29 SFRPLFifoEmpty	Specifies the SFR payload FIFO empty.
28 SFRPHFifoEmpty	Specifies the SFR Packet Header FIFO empty
27	Indicates that other DSI command transfer have overridden sync timing.

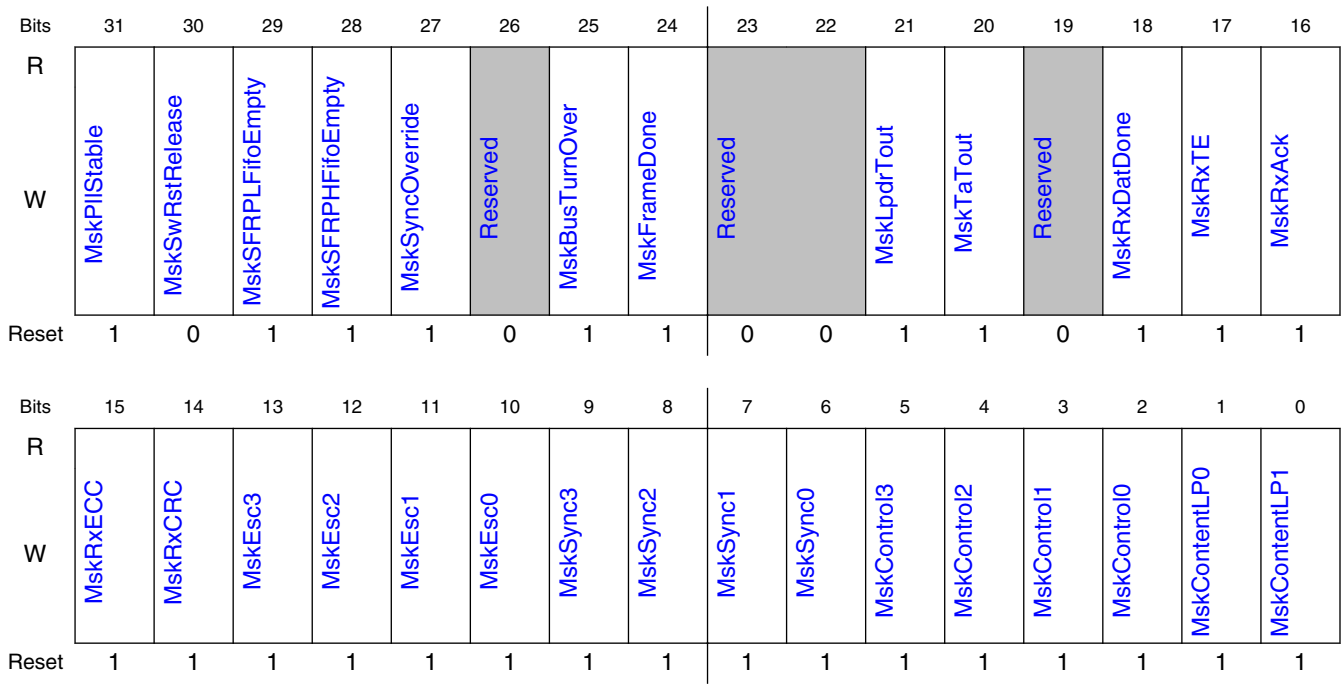
Table continues on the next page...

Field	Function
SyncOverride	
26 —	Reserved
25 BusTurnOver	Indicates when bus grant turns over from DSI slave to DSI master.
24 FrameDone	Indicates when MIPI DSI transfers the whole image frame. **NOTE:** If Hsync is not received during two line times, internal timer is timed out and this bit is flagged.
23-22 —	Reserved
21 LpdrTout	Specifies the LP Rx timeout. Please refer to the DSI_TIMEOUT register.
20 TaTout	Turns around Acknowledge Timeout. Please refer to the DSI_TIMEOUT register.
19 —	Reserved
18 RxDatDone	Completes receiving data.
17 RxTE	Receives TE Rx trigger.
16 RxAck	Receives ACK Rx trigger.
15 ErrRxECC	Specifies the ECC multi bit error in LPDR.
14 ErrRxCRC	Specifies the CRC error in LPDR.
13 ErrEsc3	Specifies the escape mode entry error lane 3. For more information, please refer to the standard D-PHY specification.
12 ErrEsc2	Specifies the escape mode entry error lane 2. For more information, please refer to the standard D-PHY specification.
11 ErrEsc1	Specifies the escape mode entry error lane 1. For more information, please refer to the standard D-PHY specification.
10 ErrEsc0	Specifies the escape mode entry error lane 0. For more information, please refer to the standard D-PHY specification.
9 ErrSync3	Specifies the LPDT sync error lane 3. For more information, please refer to the standard D-PHY specification.
8 ErrSync2	Specifies the LPDT Sync Error lane2. For more information, refer to standard D-PHY specification.
7 ErrSync1	Specifies the LPDT Sync Error lane1. For more information, refer to standard D-PHY specification.
6	Specifies the LPDT Sync Error lane0. For more information, refer to standard D-PHY specification.

Table continues on the next page...

Field	Function
ErrSync0	
5 ErrControl3	Controls Error lane3. For more information, please refer to the standard D-PHY specification.
4 ErrControl2	Controls Error lane2. For more information, please refer to the standard D-PHY specification.
3 ErrControl1	Controls Error lane1. For more information, please refer to the standard D-PHY specification.
2 ErrControl0	Controls Error lane0. For more information, please refer to the standard D-PHY specification.
1 ErrContentLP0	Specifies the LP0 Contention Error (only lane0, because BTA occurs at lane0 only). For more information, please refer to the standard D-PHY specification.
0 ErrContentLP1	Specifies the LP1 Contention Error (only lane0, because BTA occurs at lane0 only). For more information, please refer to the standard D-PHY specification.

13.6.9.1.16 Specifies the interrupt mask register. (DSI_INTMSK)



13.6.9.1.16.1 Offset

Register	Offset
DSI_INTMSK	38h

13.6.9.1.16.2 Function

This register masks interrupt sources.

13.6.9.1.16.3 Diagram

13.6.9.1.16.4 Fields

Field	Function
31 MskPllStable	Indicates that D-PHY PLL is stable.
30 MskSwRstRelease	Releases software reset.
29 MskSFRPLFifoEmpty	Empties SFR payload FIFO.
28 MskSFRPHFifoEmpty	Interrupt Mask for SFR packet header FIFO empty
27 MskSyncOverride	Indicates that other DSI command transfer have overridden sync timing.
26 —	Reserved
25 MskBusTurnOver	Indicates when bus grant turns over from DSI slave to DSI master.

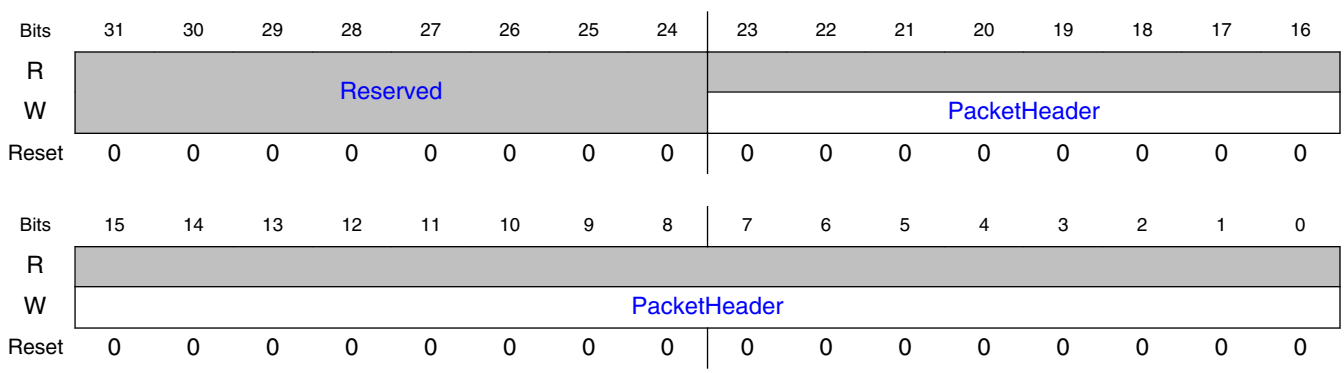
Table continues on the next page...

Field	Function
24 MskFrameDone	Indicates when MIPI DSI transfers whole image frame.
23-22 —	Reserved
21 MskLpdrTout	Specifies LP Rx timeout. Please refer to the DSI_TIMEOUT register.
20 MskTaTout	Specifies turnaround acknowledge timeout. Please refer to the DSI_TIMEOUT register.
19 —	Reserved
18 MskRxDatDone	Specifies completion of data receiving.
17 MskRxTE	Specifies receipt of TE Rx trigger.
16 MskRxAck	Specifies receipt of ACK Rx trigger.
15 MskRxECC	Specifies ECC multibit error in LPDR.
14 MskRxCRC	Specifies CRC error in LPDR.
13 MskEsc3	Specifies escape mode entry error in lane3. For more information, please refer to the standard D-PHY specification.
12 MskEsc2	Specifies escape mode entry error in lane2. For more information, please refer to the standard D-PHY specification.
11 MskEsc1	Specifies escape mode entry error in lane1. For more information, please refer to the standard D-PHY specification.
10 MskEsc0	Specifies escape mode entry error in lane0. For more information, please refer to the standard D-PHY specification.
9 MskSync3	Specifies LPDT sync error in lane3. For more information, refer to standard D-PHY specification.
8 MskSync2	Specifies LPDT sync error in lane2. For more information, refer to standard D-PHY specification.
7 MskSync1	Specifies LPDT sync error in lane1. For more information, refer to standard D-PHY specification.
6 MskSync0	Specifies LPDT sync error in lane0. For more information, refer to standard D-PHY specification.
5 MskControl3	Controls error in lane3. For more information, please refer to the standard D-PHY specification.
4	Controls error in lane2. For more information, please refer to the standard D-PHY specification.

Table continues on the next page...

Field	Function
MskControl2	
3 MskControl1	Controls error in lane1. For more information, please refer to the standard D-PHY specification.
2 MskControl0	Controls error in lane0. For more information, please refer to the standard D-PHY specification.
1 MskContentLP0	Specifies LP0 contention error. For more information, refer to standard D-PHY specification.
0 MskContentLP1	Specifies LP1 contention error. For more information, refer to standard D-PHY specification.

13.6.9.1.17 Specifies the packet header FIFO register. (DSI_PKTHDR)



13.6.9.1.17.1 Offset

Register	Offset
DSI_PKTHDR	3Ch

13.6.9.1.17.2 Function

This register is the FIFO for packet header to send DSI packets.

13.6.9.1.17.3 Diagram

13.6.9.1.17.4 Fields

Field	Function
31-24	Reserved

Table continues on the next page...

Field	Function
—	
23-0 PacketHeader	Writes the packet header of Tx packet. [7:0] = DI [15:8] = Dat0 (Word Count lower byte for long packet) [23:16] = Dat1 (Word Count upper byte for long packet)

13.6.9.1.18 Specifies the payload FIFO register. (DSI_PAYLOAD)

13.6.9.1.18.1 Offset

Register	Offset
DSI_PAYLOAD	40h

13.6.9.1.18.2 Function

This register specifies the FIFO for payload to send DSI packets.

13.6.9.1.18.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R																
W	Payload															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

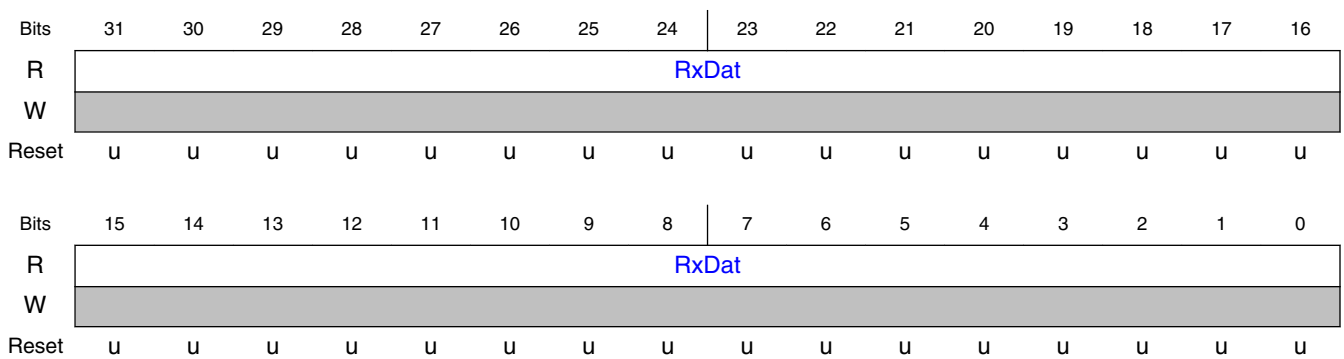
13.6.9.1.18.4 Fields

Field	Function
31-0 Payload	Writes the Payload of Tx packet.

13.6.9.1.19 Specifies the read FIFO register. (DSI_RXFIFO)



13.6.9.1.19.1 Offset

Register	Offset
DSI_RXFIFO	44h

13.6.9.1.19.2 Function

This register is the gate of FIFO read.

13.6.9.1.19.3 Diagram

13.6.9.1.19.4 Fields

Field	Function
31-0 RxDat	In the Rx mode, you can read Rx data through this register. **NOTE:** The CRC in packet is not stored in RxFIFO.

13.6.9.1.20 Specifies the FIFO threshold level register. (DSI_FIFOTHLD)

13.6.9.1.20.1 Offset

Register	Offset
DSI_FIFOTHLD	48h

13.6.9.1.20.2 Function

Specifies the FIFO threshold level register.

13.6.9.1.20.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved

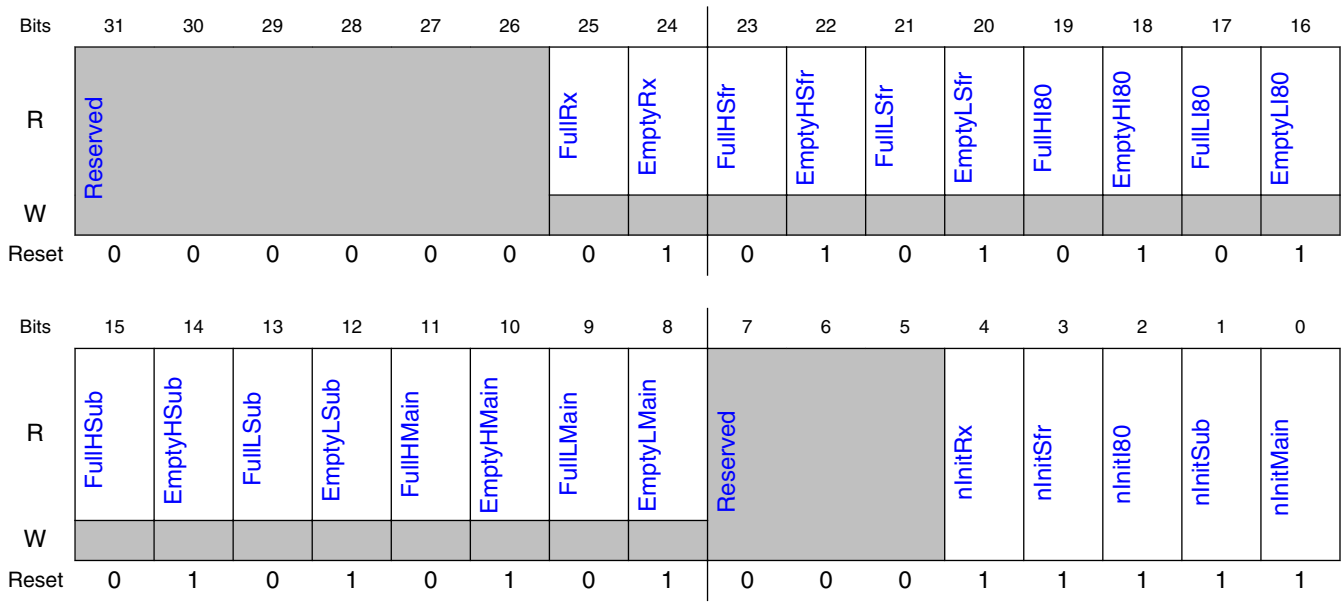
13.6.9.1.20.4 Fields

Field	Function
31-9 —	Reserved
8-0 WfullLevelSfr	Almost full level of SFR payload FIFO

13.6.9.1.21 Specifies the FIFO status and control register. (DSI_FIFOCTRL)



13.6.9.1.21.1 Offset

Register	Offset
DSI_FIFOCTRL	4Ch

13.6.9.1.21.2 Function

Specifies the FIFO status and control register.

13.6.9.1.21.3 Diagram

13.6.9.1.21.4 Fields

Field	Function
31-26 —	Reserved
25 FullRx	Rx FIFO full
24 EmptyRx	Rx FIFO empty
23 FullHSfr	SFR packet header FIFO full
22 EmptyHSfr	SFR packet header FIFO empty
21 FullLSfr	SFR payload FIFO full
20 EmptyLSfr	SFR payload FIFO empty
19 FullHI80	S-i80 packet header FIFO full
18 EmptyHI80	S-i80 packet header FIFO empty
17 FullLI80	S-i80 payload FIFO full

Table continues on the next page...

Field	Function
16 EmptyLI80	S-i80 payload FIFO empty
15 FullHSub	Sub display packet header FIFO full
14 EmptyHSub	Sub display packet header FIFO empty
13 FullLSub	Sub display payload FIFO full
12 EmptyLSub	Sub display payload FIFO empty
11 FullHMain	Main display packet header FIFO full
10 EmptyHMain	Main display packet header FIFO empty
9 FullLMain	Main display payload FIFO full
8 EmptyLMain	Main display payload FIFO empty
7-5 —	Reserved
4 nInitRx	MD FIFO read point initialize
3 nInitSfr	SFR FIFO write point initialize
2 nInitI80	S-i80 FIFO write point initialize
1 nInitSub	SD FIFO write point initialize
0 nInitMain	MD FIFO write point initialize

13.6.9.1.22 Specifies the FIFO memory AC characteristic register. (DSI_MEMACCHR)

13.6.9.1.22.1 Offset

Register	Offset
DSI_MEMACCHR	50h

13.6.9.1.22.2 Function

Specifies the FIFO memory AC characteristic register.

NOTE

In the current design, these memory port controls were disabled. User can ignore the function of this register.

13.6.9.1.22.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved

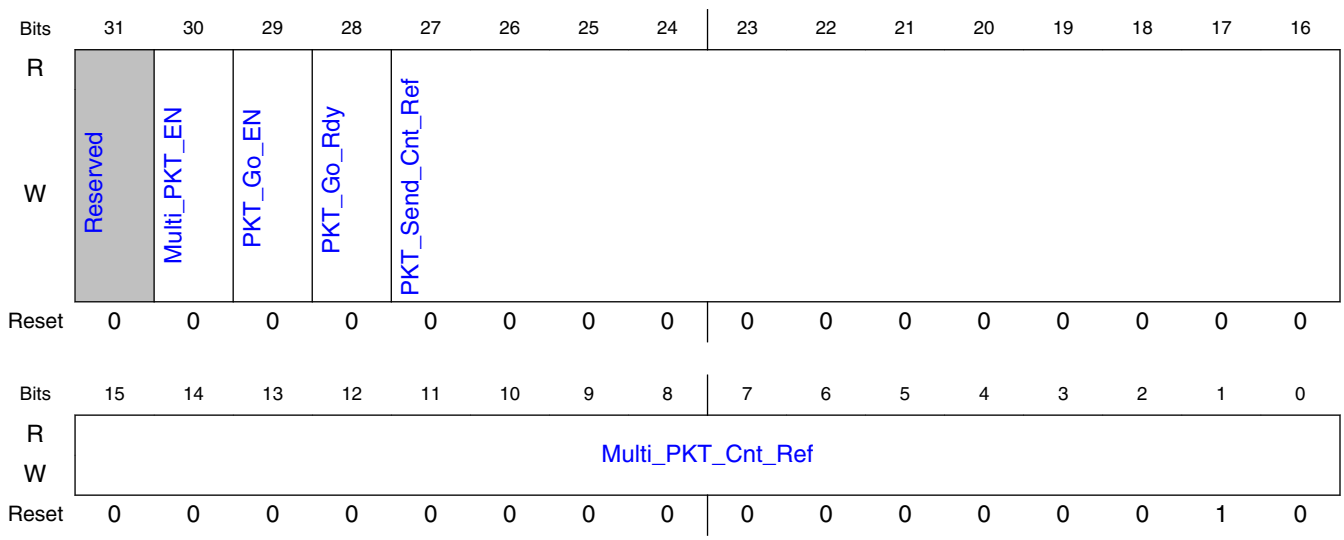
13.6.9.1.22.4 Fields

Field	Function
31-16 —	Reserved
15 PGEN_SD	Sub display FIFO memory power gating
14 RETN_SD	Sub display FIFO memory Retention
13-11 EMAB_SD	Sub display FIFO memory B port margin adjustment
10-8 EMAA_SD	Sub display FIFO memory A port margin adjustment
7 PGEN_MD	Main display FIFO memory power gating
6 RETN_MD	Main display FIFO memory Retention
5-3 EMAB_MD	Main display FIFO memory B port margin adjustment

Table continues on the next page...

Field	Function
2-0 EMAA_MD	Main display FIFO memory A port margin adjustment

13.6.9.1.23 Specifies the Multi Packet, Packet Go register. (DSI_MULTI_PKT)



13.6.9.1.23.1 Offset

Register	Offset
DSI_MULTI_PKT	78h

13.6.9.1.23.2 Function

Specifies the Multi Packet, Packet Go register.

13.6.9.1.23.3 Diagram

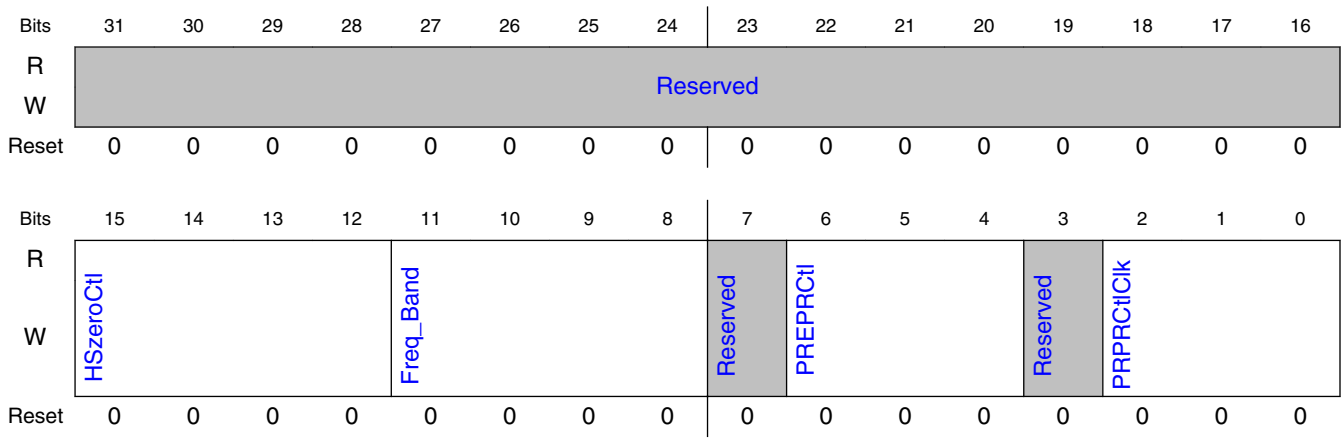
13.6.9.1.23.4 Fields

Field	Function
31 —	Reserved
30	Specifies the send multi command packets on single transmission.

Table continues on the next page...

Field	Function
Multi_PKT_EN	Multi command packet can transfer by only HS mode. ‘0’ = Send single command packet. ‘1’ = Send multi command packets.
29 PKT_Go_EN	Specifies the send command packet(s) per frame enable Packet go can transfer by only HS mode. ‘0’ = Send command packet(s) during every VFP. ‘1’ = Send command packet(s) during 1frame VFP.
28 PKT_Go_Rdy	Specifies the send command packet(s) on this frame VFP. If packet transferred or PKT_Go_EN is disabled, this bit goes to 1'b0.
27-16 PKT_Send_Cnt_Ref	Specifies the command packet(s) send point indicator. That value is 1H time + D-PHY LP-HS-LP latency by ByteCLK. Do not use '0'.
15-0 Multi_PKT_Cnt_Ref	Specifies the number of packets on single transmission. Do not use '0' and '1'. 0 and 1 are same as '2'

13.6.9.1.24 Specifies the 1Gbps D-PHY PLL control register. (DSI_PLLCTRL_1G)



13.6.9.1.24.1 Offset

Register	Offset
DSI_PLLCTRL_1G	90h

13.6.9.1.24.2 Function

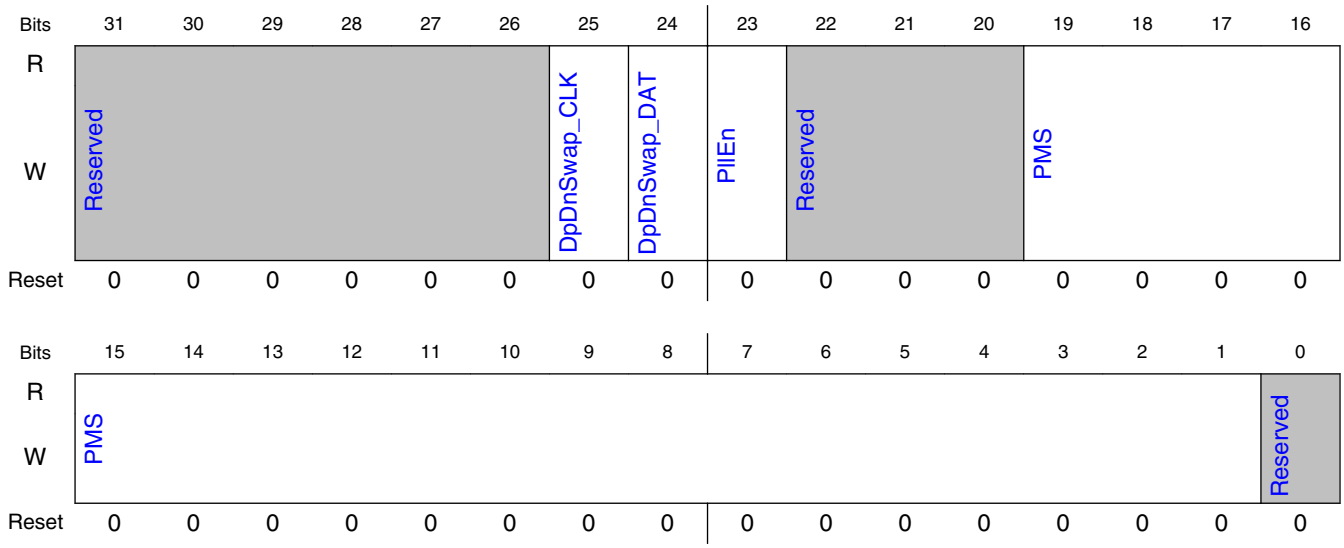
This register configures 1Gbps D-PHY PLL control, D-PHY, clock range indication, and so on.

13.6.9.1.24.3 Diagram

13.6.9.1.24.4 Fields

Field	Function
31-16 —	Reserved
15-12 HSzeroCtl	1Gbps D-PHY HS-Zero driving timing control.
11-8 Freq_Band	1Gbps D-PHY Timing control for D-PHY global operation timing.
7 —	Reserved
6-4 PREPRCtl	1Gbps D-PHY PLL Tclk-prepare and Ths-prepare driving control.
3 —	Reserved
2-0 PRPRCtlClk	1Gbps D-PHY PLL Ths-prepare driving time control.

13.6.9.1.25 Specifies the PLL control register. (DSI_PLLCTRL)



13.6.9.1.25.1 Offset

Register	Offset
DSI_PLLCTRL	94h

13.6.9.1.25.2 Function

This register configures PLL control, D-PHY, clock range indication, and so on.

13.6.9.1.25.3 Diagram

13.6.9.1.25.4 Fields

Field	Function
31-26 —	Reserved
25 DpDnSwap_CLK	Swaps Dp/Dn channel of clock lane. If this bit is set, Dp and Dn channel swap each other.
24 DpDnSwap_DAT	Swaps Dp/Dn channel of Data lanes. If this bit is set, Dp and Dn channel swap each other.
23 PllEn	Enables PLL.
22-20 —	Reserved
19-1 PMS	Specifies the PLL PMS value.
0 —	Reserved

13.6.9.1.26 Specifies the PLL control register 1. (DSI_PLLCTRL1)

13.6.9.1.26.1 Offset

Register	Offset
DSI_PLLCTRL1	98h

13.6.9.1.26.2 Function

This register configures D-PHY PLL control (M_PLLCTL[31:0]).

13.6.9.1.26.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	M_PLLCTL0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.6.9.1.26.4 Fields

Field	Function
31-0 M_PLLCTL0	M_PLLCTL[31:0] to D-PHY

13.6.9.1.27 Specifies the PLL control register 2. (DSI_PLLCTRL2)

13.6.9.1.27.1 Offset

Register	Offset
DSI_PLLCTRL2	9Ch

13.6.9.1.27.2 Function

This register configures D-PHY PLL control (M_PLLCTL[39:32]).

13.6.9.1.27.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	Reserved								M_PLLCTL1							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.6.9.1.27.4 Fields

Field	Function
31-8 —	Reserved
7-0 M_PLLCTL1	M_PLLCTL[39:32] to D-PHY

13.6.9.1.28 Specifies the PLL timer register. (DSI_PLLTMR)

13.6.9.1.28.1 Offset

Register	Offset
DSI_PLLTMR	A0h

13.6.9.1.28.2 Function

Specifies the PLL timer register.

13.6.9.1.28.3 Diagram

13.7 MIPI D-PHY (MIPI_DPHY)

13.7.1 Overview

The MIPI D-PHY core IP is a flexible, low power and high-speed serial interface that connects a display driver or a camera sensor to a host processor. The D-PHY provides a synchronous connection between Master and Slave with clock signal originating at the Master and terminating at the Slave. The main operation modes are HS mode (High Speed Mode) and LP mode (Low Power Mode).

13.7.1.1 Block Diagram

The MIPI D-PHY core consist of 5 modules.

- Common block(BIAS/PLL)
- Master clock lane
- Master data 4-lanes
- Slave clock lane
- Slave data 4-lanes

The following figure illustrates the architectural block diagram of 4-lane D-PHY with common block. PLL offers the operating clock for Master block operation. Slave block uses clock from slave clock lane input PAD at the normal operation mode. BIAS block make the analog reference voltages and currents for analog function. HS mode 0.4V voltage regulator is embedded into IP and is just used for Master blocks.

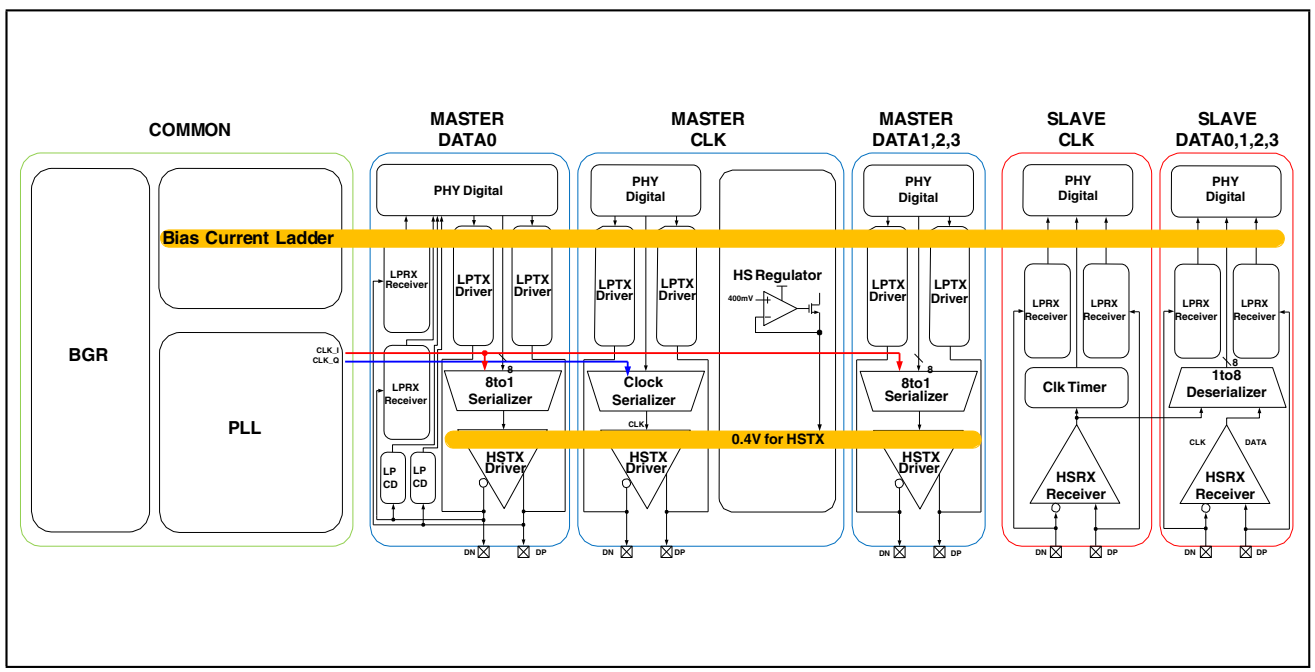

Figure 13-53. D-PHY Architecture

13.7.1.2 Features

The features of MIPI D-PHY are:

- D-PHY spec v1.2 compatible.
- Synchronous link between Master (data source) and Slave (data sink).
- All lanes support high-speed transmission in the forward direction.
- Bi-directional data transmission in Low-Power mode at the Master Data Lane 0 only.
- Uses token passing to control the communication direction of the link.

- High-Speed mode for fast data traffic and Low-Power mode for controls and low-speed data transmission.
- High-Speed mode: Differential and terminated, 200 mV swing: 80 – 1500 Mbps.
- Low-Power mode: Single-ended and non-terminated, 1.2 V swing: 10 Mbps maximum.

NOTE

Use this mode for low-speed asynchronous data communications or controls.

13.7.2 Functional Description

The main functional blocks of MIPI D-PHY are described below.

13.7.2.1 Common

The Common block consists of a band-gap reference (BGR), bias generator, and PLL. Detailed information on each block is described in the following sections.

13.7.2.2 BGR and bias generator

The BGR circuit generates high-accuracy reference voltage of 820mV across PVT variation. A bias generator makes internal-resistor (RMRES)-referred currents, and these currents are distributed to each block in Common and Lanes. The internal resistor-referred current is generated using internally integrated replica resistor to compensate resistance error across PVT variation.

13.7.2.3 Phase Locked Loop (PLL)

The PLL in the Common synthesizes high-speed clock, which is used for TX serializer from a reference clock. The nominal reference frequency is 26MHz.

In the PHY, the high frequency clock from PLL is used in the serialization of TX data. The following are the main features of the PLL:

- Supports output frequency from 80MHz to 2.1GHz clock
- Supports pre-defined and programmable divider setting for MIPI D-PHY specification
- Supports spread spectrum clocking (SSC) with sigma-delta modulated fractional divider.

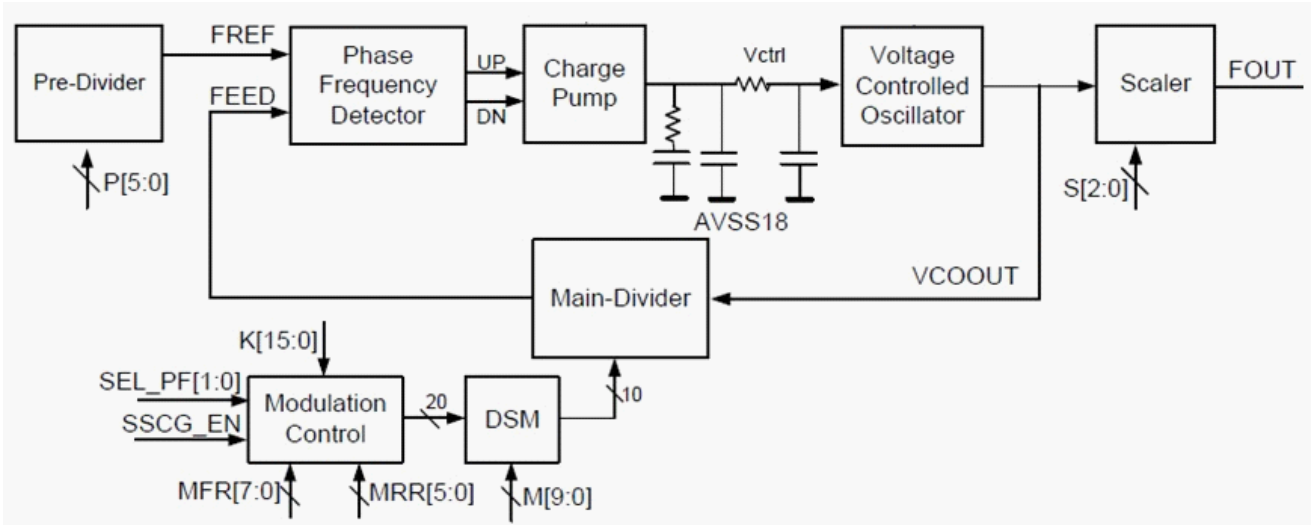

Figure 13-54. Phase Locked Loop (PLL)

13.7.2.4 DPHY PLL

The MIPI DSI DPHY PLL is a high performance PLL based frequency synthesizer that incorporates a independent output divider. The PLL block diagram is shown below.

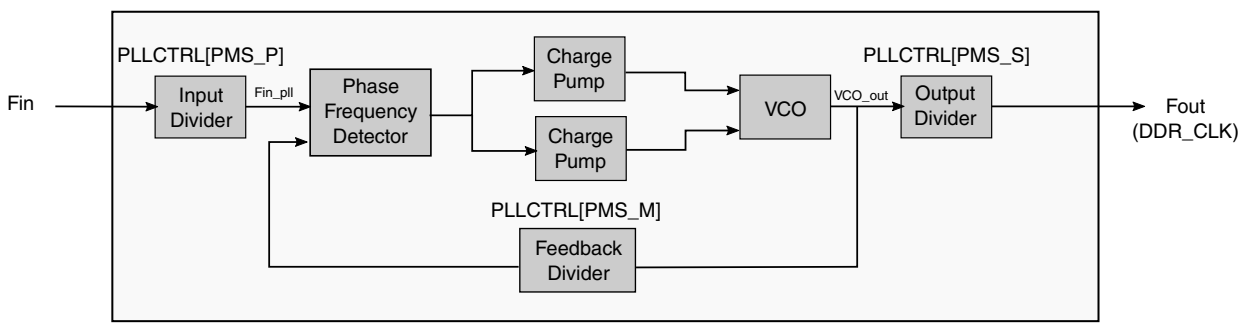

Figure 13-55. MIPI DSI DPHY PLL Block Diagram

The DPHY PLL input clock is Fin. The PLL output (Fout) multiplies the input frequency (Fin) by `(M / (P * 2^S))`.

NOTE

Setting P or M divider values as zero can cause malfunction of the PLL.

NOTE

The P and M divider values must be programmed to maintain VCO stability. The VCO output frequency (VCO_out) range of the MIPI PLL is from 1050 MHz to 2100 MHz.

Table 13-26. DPHY PLL Parameters

Parameter	Description	Range
Fin	Input Frequency	6MHz-300MHz
Fin_pll	P divider frequency	2MHz-30MHz
VCO_out	(M*Fin) / P	1050MHz-2100MHz
Fout	(M*Fin)/(P*2^S)	32.8125MHz-2100MHz
P	Input Divider	1-63
M	Feedback Divider	64-1023
S	Output Divider (2^S)	1,2,4,8,16,32

13.7.2.5 Serializer

The serializer accepts 8-bit data from the PHY digital which is synchronized to TX byte clock. The parallel data is converted to the high-speed serial data. Finally, serializer transmits the serial data through the driver.

13.7.2.6 HS TX Driver

The driver generates baud-rate voltage waveform on TX output pads. The driver comprises of pre-driver and main-driver. The output data of serializer are delivered to the main-driver via the pre-driver. The main driver is based on voltage-mode driver to achieve a small power consumption and voltage swing.

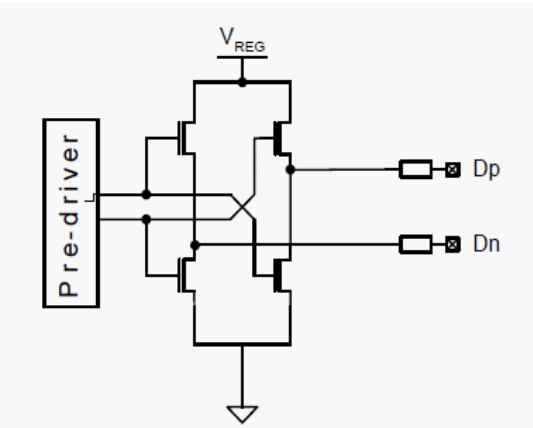

Figure 13-56. HS TX Driver

13.7.2.7 LP TX Driver

In the low power mode, LP TX driver sends the low frequency data under 10Mbps. Generally LP-11 stop state and HS enter sequence (LP-11 ◊ LP-01 ◊ LP-00) are used mostly.

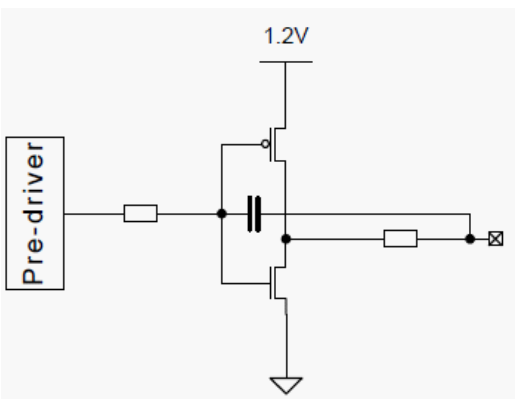

Figure 13-57. LP TX Driver

13.7.2.8 De-Serializer

In the BIST (Built-In Self-Test) mode, the serial data from the serializer is fed back to the de-serializer. And in the real mode, the real data from HS-RX receiver is sent to the de-serializer. De-serializer converted serial data to 8- bit parallel data and transferred them into PHY digital circuit for sending data to link or checking bit error at BIST mode.

13.7.2.9 HS RX Receiver

The high speed data from the MIPI D-PHY master has the MIPI D-PHY electrical characteristics. HS RX receiver convert it to the TTL CMOS level and send it to de-serializer for making the low parallel data.

13.7.2.10 LP RX Receiver

In the low power mode, LP RX receiver make esc clock from LP signal and converts the voltage level from 1.2V level to TTL CMOS logic level. And it sends them to PHY digital for command interpretation. And LP RX receiver always watches the DP/DN signal level. If DP/DN goes to LP-11, PHY recognizes Stop-state, and enters to low power mode.

13.7.2.11 PLL and Clock Lane Connection

MIPI D-PHY is a source synchronous system where the Master clock lane sends high speed differential clock to Slave clock lane. Master PLL generates the high speed clock from input clock. During LP (Low-Power) mode, LP signals are sent by the master block. LP-TX sends the LP signals requried for changing modes between LP (Low-Power) mode and HS (High-Power) mode. Slave block has a termination resistor between the differential signals that is enabled during HS mode.

The following figure illustrates the PLL and Clock Lane connection.

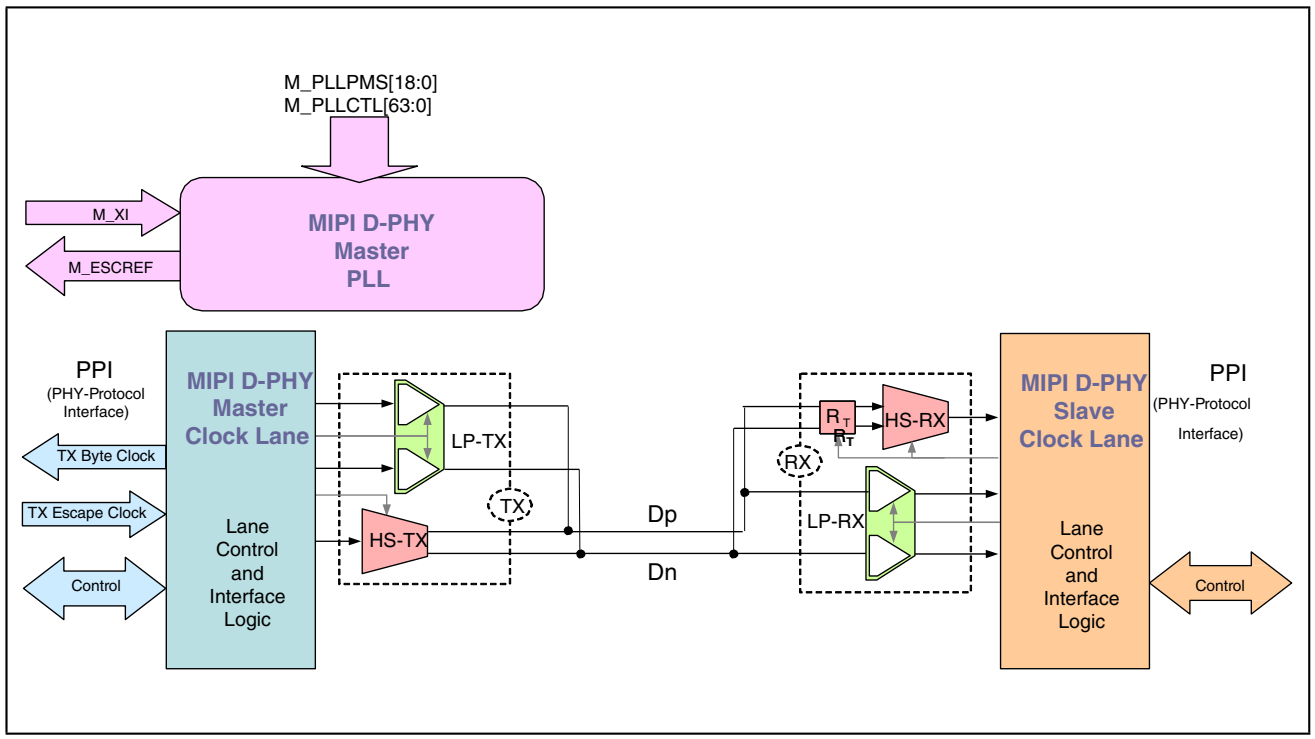

Figure 13-58. PLL and Clock Lane Connection

13.7.2.12 Data Lane Connection

The following figure illustrates the Data0 Lane connection between Master and the Slave. Master Data0 lane is important for DSI interface as it has the LP-CD and LP-RX. LP-RX is used for Turn-Around function. It used to be called as Bus Turn-Around (BTA) and it is needed for sending Low Power Data Transmission from Slave to Master. Low Power - Contention Detector (LP-CD) is used for detecting the abnormal state when both of Master LP-TX and Slave LP-TX at BTA mode are enabled and the output signals are conflicted.

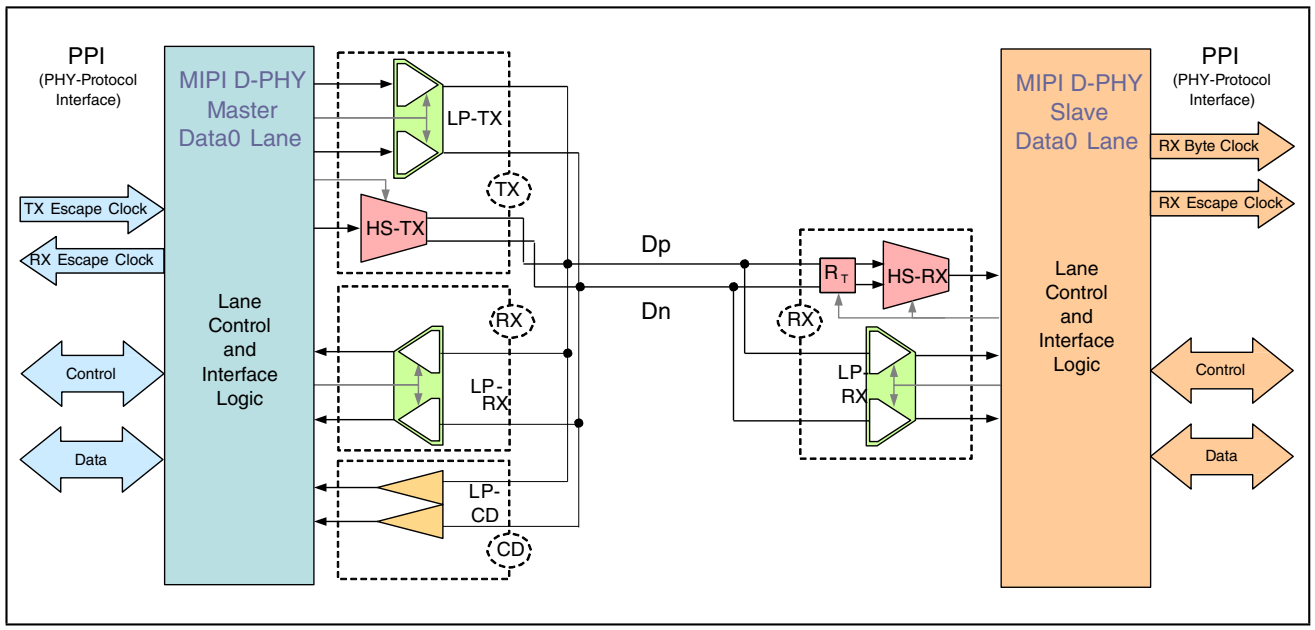

Figure 13-59. Data0 Lane Connection

The following figure illustrates the Data Lane connection between Master and the Slave for 1, 2 and 3 lanes. LP mode signals are used to switch between LP mode and HS mode. HS mode is used for interfacing high speed signals. Slave block has termination resistor between differential signals that is enabled during HS mode.

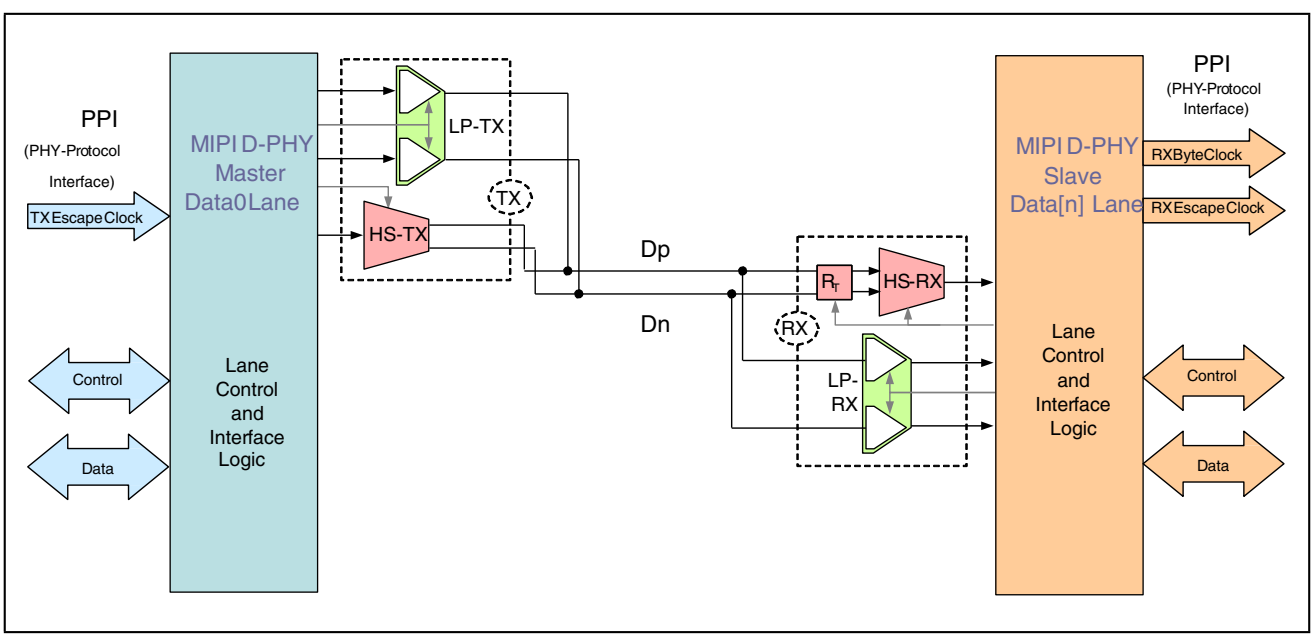

Figure 13-60. Data[n] Lane Connection

13.7.2.13 Protocol Support Summary

A summary of supported standards with corresponding data rates is listed in the below table.

Table 13-27. Supported Standards

Standard	Lane	Data Rate
MIPI D-PHY V1.2	4	80Mbps~1500Mbps

13.7.2.14 IP Interface

MIPI D-PHY configuration contains a Clock Lane Module and 1–4 Data Lane Modules. "0/1/2/3" in signals signify the data lane 0/1/2/3.

13.7.2.14.1 Pad Signals

The MIPI D-PHY core includes the I/O pads. I/O pads are dedicated to D-PHY and you cannot share them with any other signals. You can determine the number of power pads and signal pads from the core module configurations.

The following table describes the pad signals.

Table 13-28. Pad Signals

Mode	I/O	Active Level	Description
M_VREG_0P4V	I/O	N/A	Regulator capacitor connection
M_DPCLK	O	N/A	Master CLK Lane DP
M_DNCLK	O	N/A	Master CLK Lane DN
M_DPDATA0	O	N/A	Master DATA0 Lane DP
M_DNDATA0	O	N/A	Master DATA0 Lane DN
M_DPDATA1	O	N/A	Master DATA1 Lane DP
M_DNDATA1	O	N/A	Master DATA1 Lane DN
M_DPDATA2	O	N/A	Master DATA2 Lane DP
M_DNDATA2	O	N/A	Master DATA2 Lane DN
M_DPDATA3	O	N/A	Master DATA3 Lane DP
M_DNDATA3	O	N/A	Master DATA3 Lane DN
S_DPCLK	I	N/A	Slave CLK Lane DP
S_DNCLK	I	N/A	Slave CLK Lane DN
S_DPDATA0	I	N/A	Slave DATA0 Lane DP
S_DNDATA0	I	N/A	Slave DATA0 Lane DN
S_DPDATA1	I	N/A	Slave DATA1 Lane DP

Table continues on the next page...

Table 13-28. Pad Signals (continued)

Mode	I/O	Active Level	Description
S_DNDATA1	I	N/A	Slave DATA1 Lane DN
S_DPDATA2	I	N/A	Slave DATA2 Lane DP
S_DNDATA2	I	N/A	Slave DATA2 Lane DN
S_DPDATA3	I	N/A	Slave DATA3 Lane DP
S_DNDATA3	I	N/A	Slave DATA3 Lane DN
VDD18_PLL	Supply	N/A	1.8V Power for PLL
DVDD08D_PLL	Supply	N/A	0.9V Power for PLL
MS_VDD_0P8	Supply	N/A	0.9 V Power for Internal Logic
MS_VDD18	Supply	N/A	1.8 V Power for Analog
M_VDD12	Supply	N/A	1.2 V Power for Analog
MS_VSS	GND	N/A	Ground
RTO/SNS/VB0/VB1/V18/V25	I/O	N/A	These signals are I/O pad's ring signals. If you want to get more detail information about these signals, check the datasheet of GPIO.

13.7.2.14.2 ESD Protection Port

The anti-parallel diode is located between the D-PHY ground and the SoC logic ground for ESD protection.

Table 13-29. ESD Protection Port

Mode	I/O	Active Level	Description
VSS_CDM	Supply	N/A	This port is connected to the SoC logic ground with wide metal. See Figure 21.

13.7.2.14.3 Control Register: PPI Signals

13.7.2.14.3.1 Timing Control Register of High-Speed Data Transmission

To enable High-Speed Transmission, the following registers need to be set. For more information on the registers, refer to the register description section.

The following table describes the Timing Control Registers of High-Speed Data Transmission.

Table 13-30. Timing Control Registers of High-Speed Data Transmission

Name	I/O	Active Level	Description
M_TCLKPRPRCTL[7:0]	I	N/A	Master Clock Lane Control Register for TCLK-PREPARE.
M_TCLKZEROCTL[7:0]	I	N/A	Master Clock Lane Control Register for TCLK-ZERO.
M_TCLKPOSTCTL[7:0]	I	N/A	Master Clock Lane Control Register for TCLK-POST.
M_TCLKTRAILCTL[7:0]	I	N/A	Master Clock Lane Control Register for TCLK-TRAIL.
M_THSPRPRCTL[7:0]	I	N/A	Master Data Lanes Control Register for THS-PREPARE.
M_THSZEROCTL[7:0]	I	N/A	Master Data Lanes Control Register for THS-ZERO.
M_THSTRAILCTL[7:0]	I	N/A	Master Data Lanes Control Register for THS-TRAIL.
M_TLPXCTL[7:0]	I	N/A	Master Clock and Data Lanes Control Register for TLPX.
M_THSEXITCTL[7:0]	I	N/A	Master Clock and Data Lanes Control Register for THS-EXIT.
S_CLKSETTLECTL[1:0]	I	N/A	Slave Clock Lane Control Register for TCLK-SETTLE. 2'b0x = 110 ns to 280ns (v0.87 to v1.2) 2'b10 = 150 ns to 430ns (v0.83 to v0.86) 2'b11 = 60 ns to 140ns (v0.82)
S_HSSETTLECTL[7:0]	I	N/A	Slave Clock Lane Control Register for THS-SETTLE.

13.7.2.14.4 PPI Requests and Timing Conditions

13.7.2.14.4.1 PPI Request Conditions

Following are the request conditions invoked by the D-PHY:

- The Correct request timing window is in the Stop state.
- Accepts only one request from protocol.
- D-PHY selects only one request based on the service priority when you assert two or more requests.

13.7.2.14.4.2 PPI Requests and D-PHY Timing

HS-TX:

- **Latency** - The minimum required FIFO depth is 128, because the HS-TX requests the HS-TX ready latency.
- **Data Lane** - D-PHY ensures $T_{HS-EXIT}$ (minimum 100 ns) timing.
- **Clock Lane** - D-PHY must guarantee the $T_{CLK-PRE}$ and $T_{CLK-POST}$ timings.

NOTE

The protocol layer need not control these timings.

- **HS-2-HS Request Interval** - Not implied.

LP:

- **LP–2–LP Request** - The LP-2-LP request wait for the 2-ESC CLK.

LP and HS:

- **LP–2–HS Request Interval** - LP-2-HS request interval wait for the 2-ESC CLK in the Stop state.
- **HS-2-LP Request Interval** - Not implied.

13.7.2.14.4.3 Protocol Watchdog Timers

Following are the features of the Protocol Watchdog Timers:

- **HS RX Timeout** - Protocol specific.
  - The Protocol times-out when there is no EoT received within a certain period in the HS RX mode.
- **HS TX Timeout** - Protocol specific.
  - The maximum transmission length in HS TX is bounded.
- **Escape Mode Timeout** - Protocol specific.
  - The Escape mode timeout should be greater than the Escape mode Silence Limit of the other device.
- **Escape Mode Silence Timeout** - Protocol specific.
  - A device has a bound length for LP TX-00 during Escape mode, after which the other device may timeout. For example, a display module must have an Escape Mode Silence Limit, after which the host processor can timeout.
- **Turnaround Errors**
  - The Protocol times out initiates appropriate action when there is no acknowledgement observed within a certain period of time.

13.7.2.14.5 Core Interface Timing Diagrams

13.7.2.14.5.1 Clock Lane: HS-TX and HS-RX Function

The following figure illustrates the HS-TX and HS-RX function of the Clock Lane.

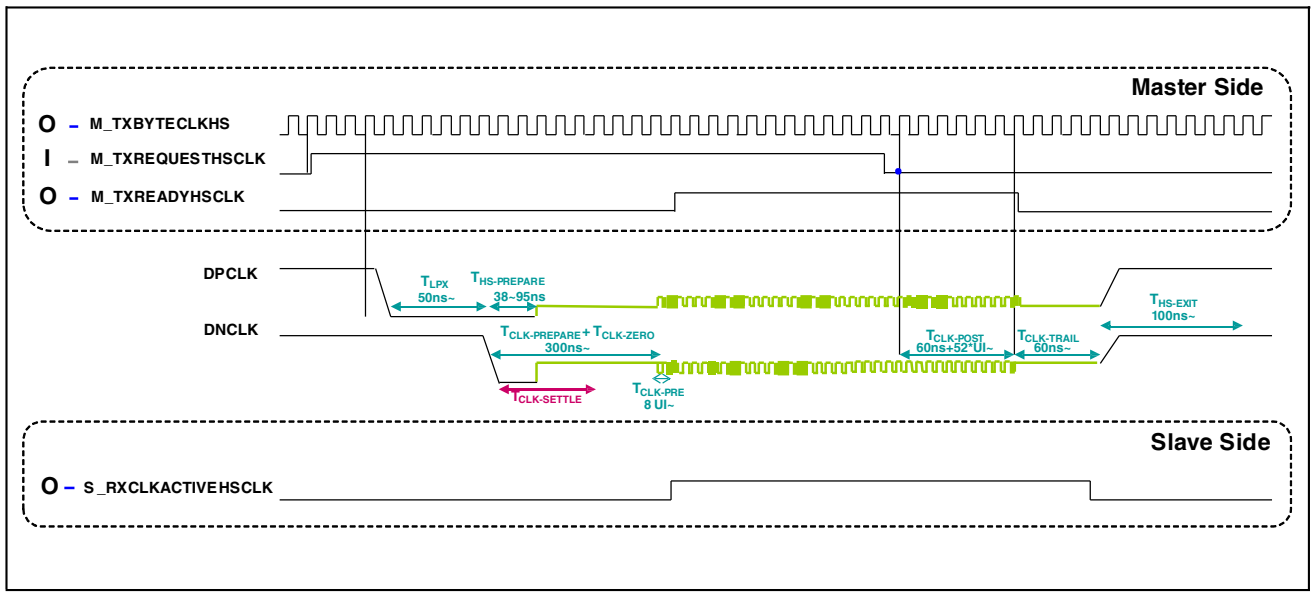

Figure 13-61. Clock Lane: HS-TX and HS-RX Function

13.7.2.14.5.2 Data Lane: HS-TX and HS-RX Function

The following figure illustrates the HS-TX and HS-RX function of the Data Lane.

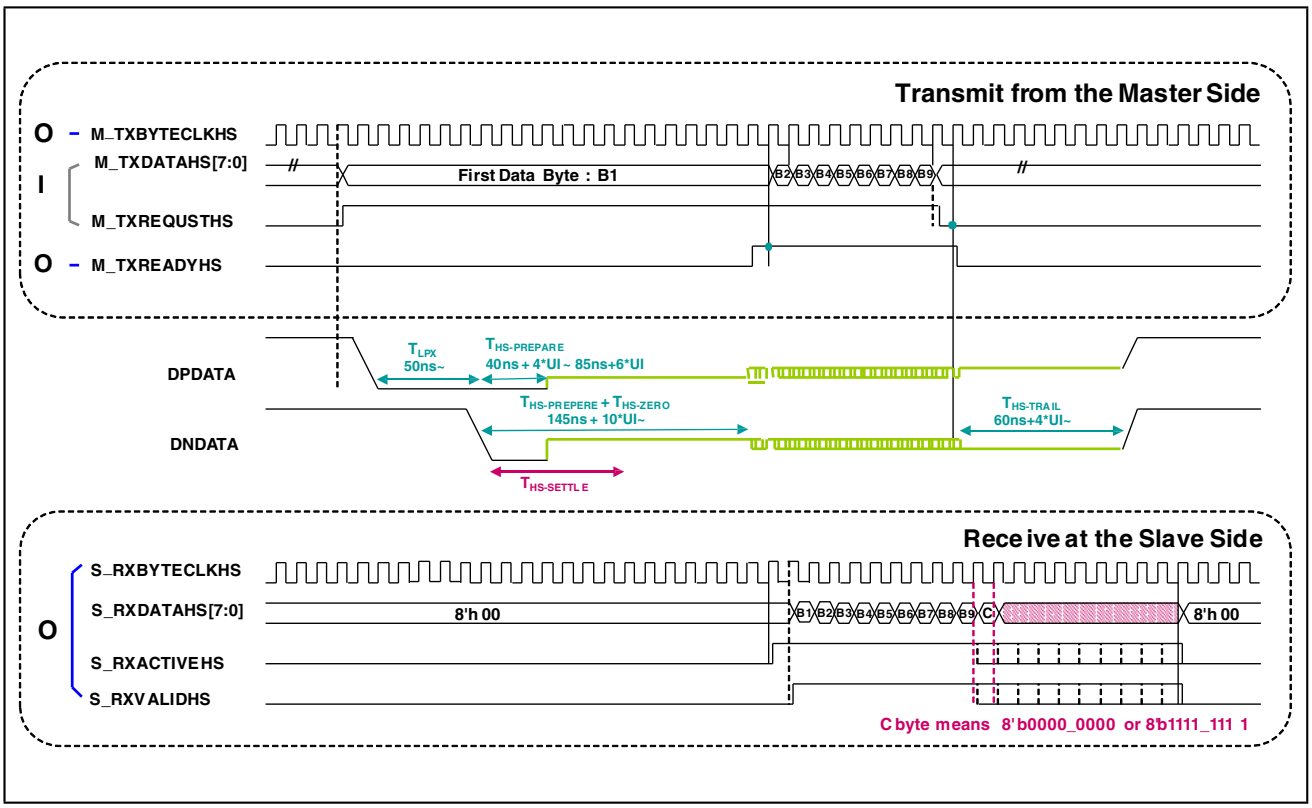

Figure 13-62. Data Lane: HS-TX and HS-RX Function

13.7.2.14.5.3 Clock Lane: ULPS Function

The following figure illustrates the ULPS function of the Clock Lane.

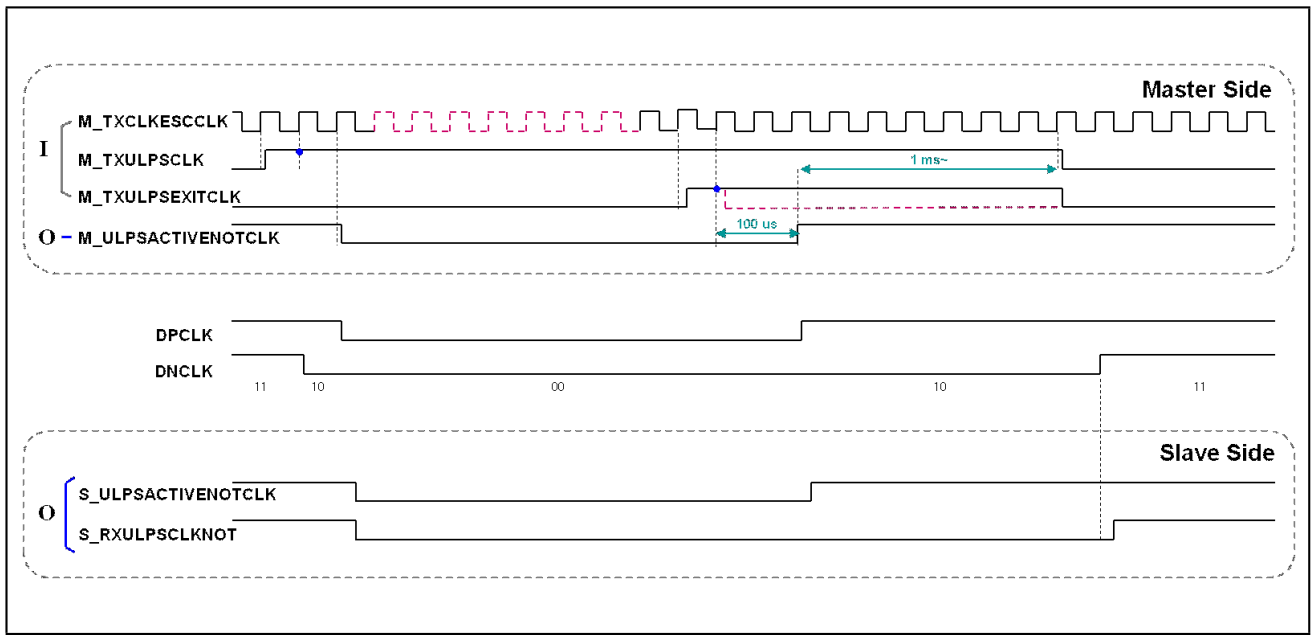

Figure 13-63. Clock Lane: ULPS Function

13.7.2.14.5.4 Data Lane: ULPS Function

The following figure illustrates the ULPS function of the Data Lane.

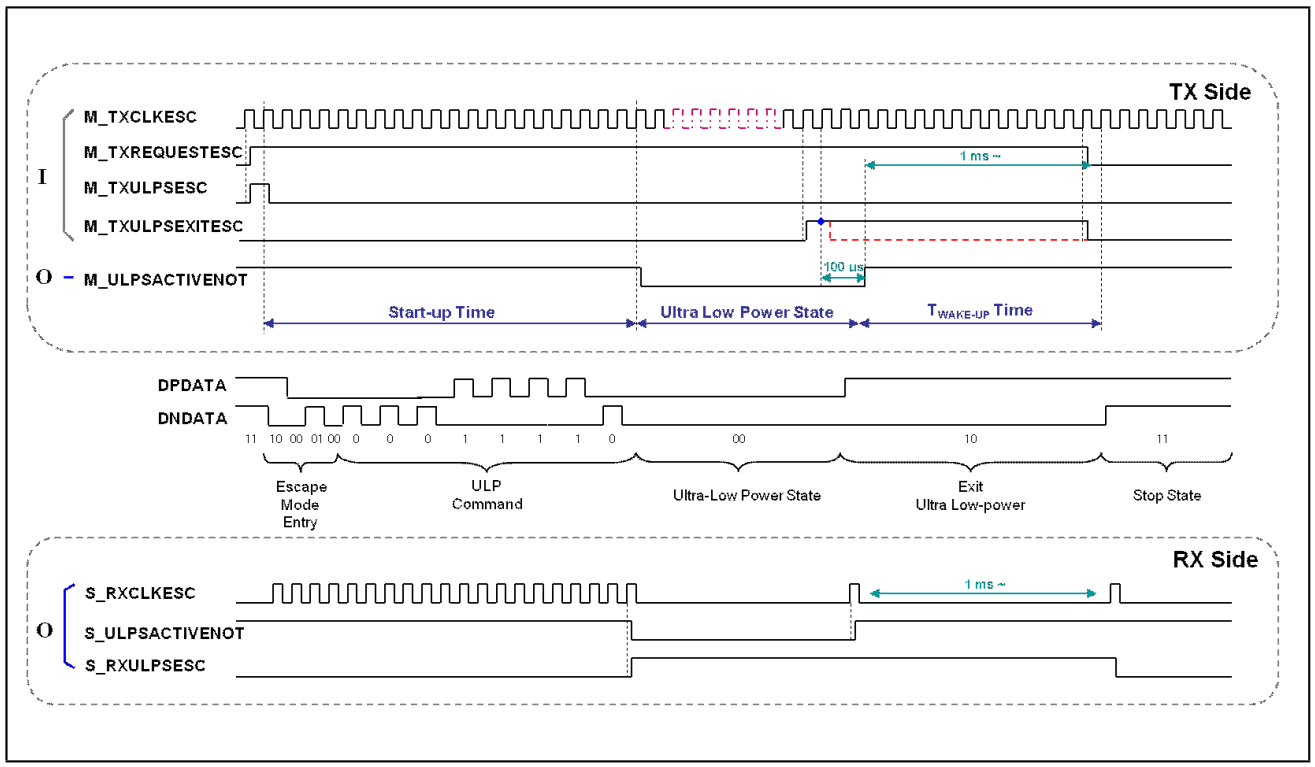

Figure 13-64. Data Lane: ULPS Function

13.7.2.14.5.5 Data Lane: LP-TX and LP-RX Function

The following figure illustrates the LP-TX and LP-RX function of the Data Lane.

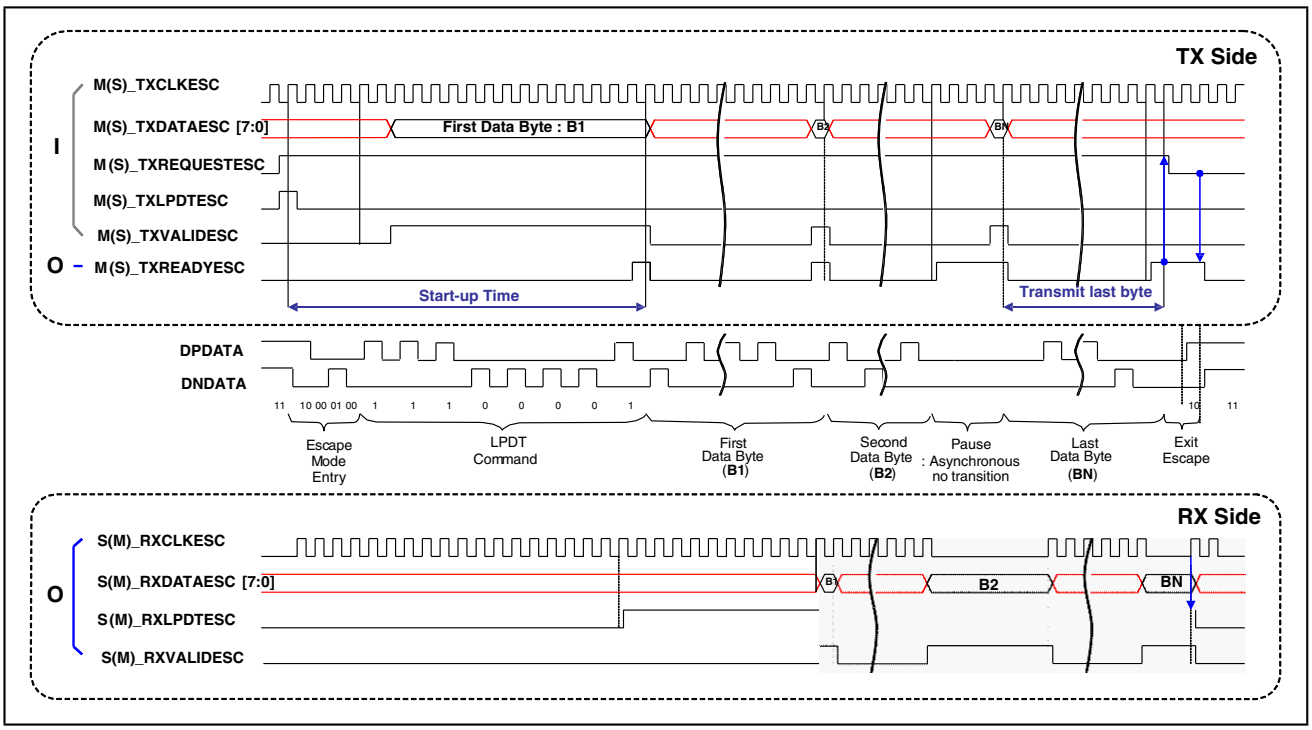

Figure 13-65. Data Lane: LP-TX and LP-RX Function

13.7.2.14.5.6 Data Lane: Remote Trigger Reset

The following figure illustrates the remote trigger reset of the Data Lane.

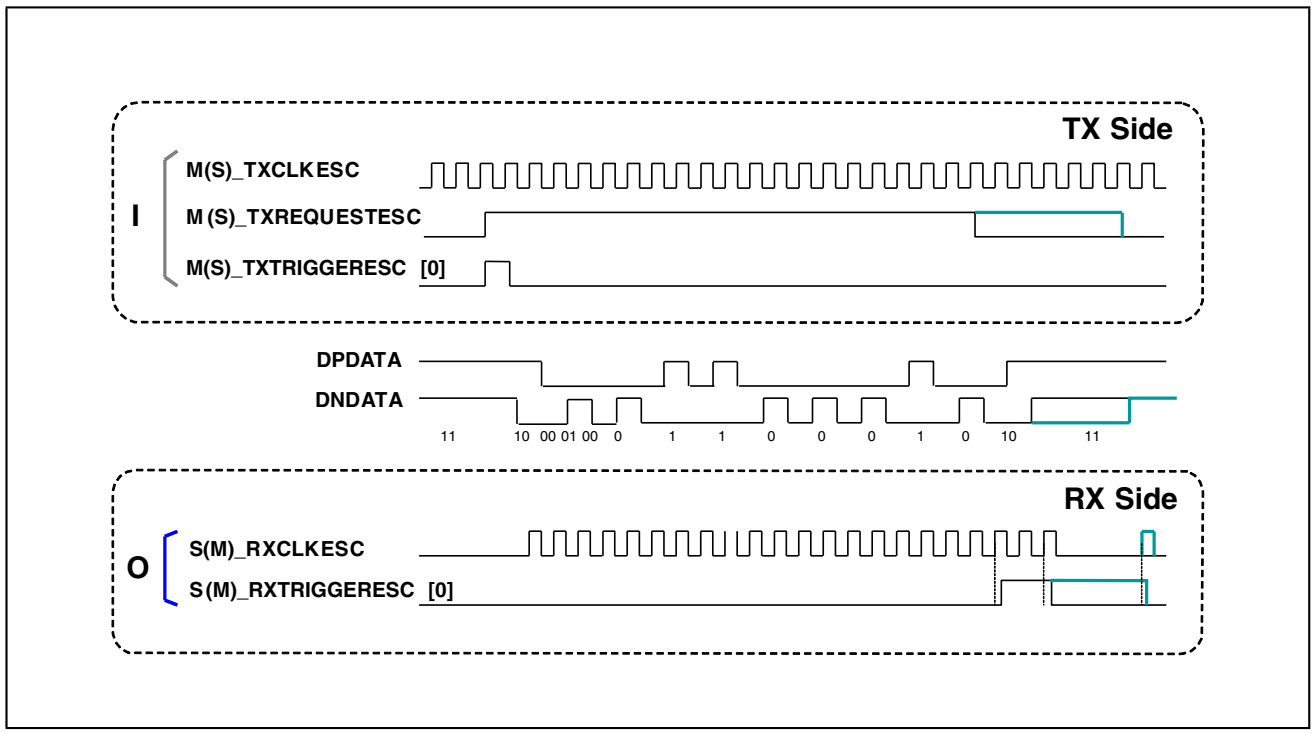

Figure 13-66. Data Lane: Remote Trigger Reset

13.7.2.14.5.7 Data Lane: Turn Around

The following figure illustrates the turnaround of the Data Lane.

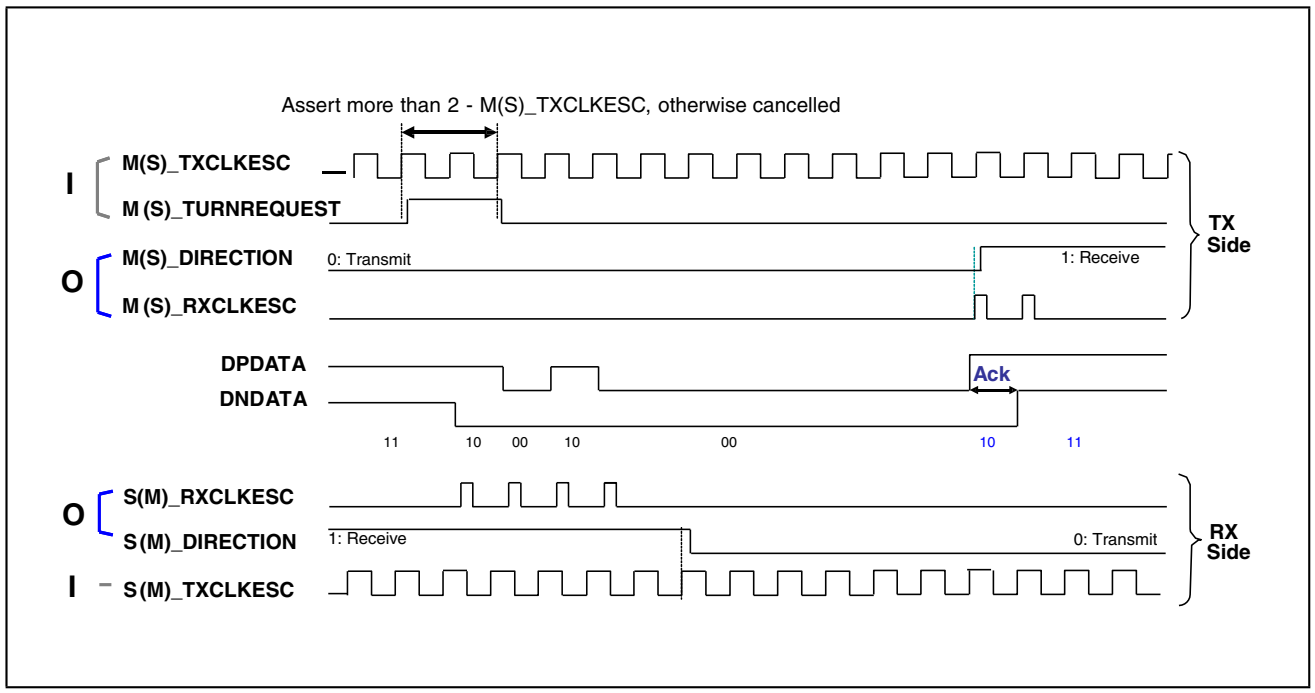

Figure 13-67. Data Lane: Turn Around

13.7.2.14.5.8 Skew Calibration

The following figure illustrates the Skew Calibration sequence.

The protocol should assert the M_TXSKEWCALHS synchronized M_TXBYTECLKHS for start Skew Calibration. PHY-Protocol Interface output signals of the Slave are 1'b0 in the Skew Calibration mode.

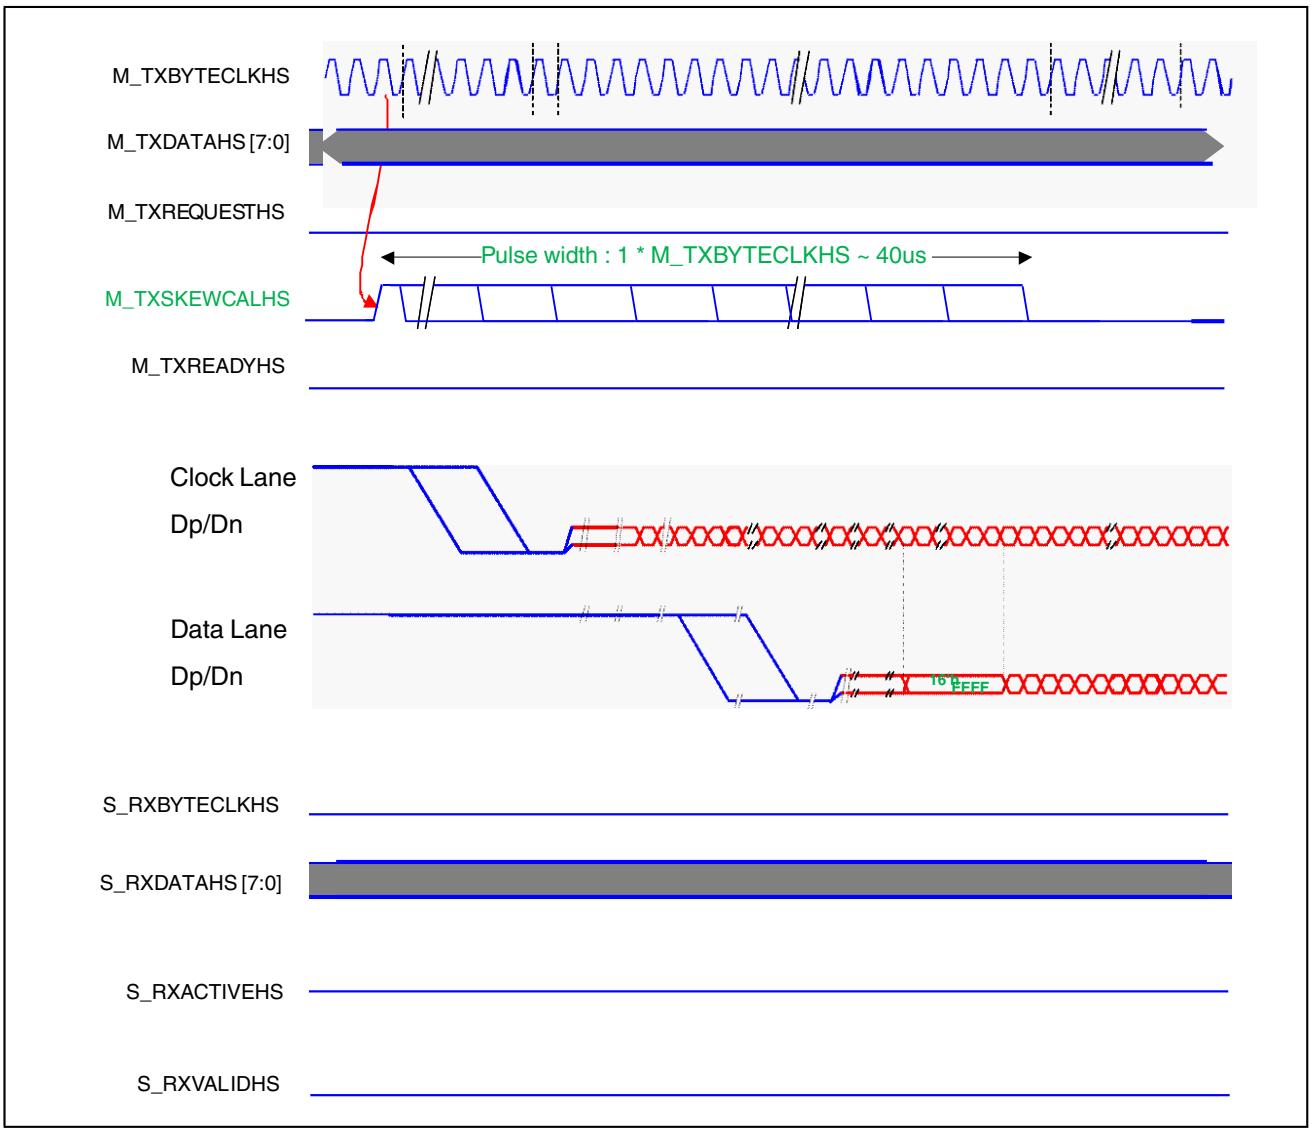

Figure 13-68. Skew Calibration

13.7.3 Clocks

The table below shows the clock signal in MIPI D-PHY:

Table 13-31. Clocks

Clocks	Description
M_XI	Master PLL reference input clock.
M_TXBYTECLKHS	HS Clock to Master Clock Lane and Master Data0/1/2/3 Lane.
S_RXBYTECLKHS0	HS Clock from Slave Data Lane0. Assign output PAD for monitoring.

13.7.4 Reset Signals

The following table describes the reset and test mode signals.

Table 13-32. Reset : PPI Signals

Name	I/O	Active Level	Description
M_RESETN	I	Low	Master Clock and Data Lane Reset (Active Low)
S_RESETN	I	Low	Slave Clock and Data Lane Reset (Active Low)
INTERNAL_LOOPBACK_EN	I	High	Internal or External Loopback selection signal • 1'b0 = External Loopback Mode (default) • 1'b1 = Internal Loopback Mode
SCAN_MODE	I	High	Scan Test mode selection
M_SCAN_CLK_0	I	N/A	Master Data0 Lane Scan Test Mode Clock
M_SCAN_CLK_1	I	N/A	Master Data1 Lane Scan Test Mode Clock
M_SCAN_CLK_2	I	N/A	Master Data2 Lane Scan Test Mode Clock
M_SCAN_CLK_3	I	N/A	Master Data3 Lane Scan Test Mode Clock
M_SCAN_IN_0	I	N/A	Master Data0 Lane Scan Test Mode Input
M_SCAN_IN_1	I	N/A	Master Data1 Lane Scan Test Mode Input
M_SCAN_IN_2	I	N/A	Master Data2 Lane Scan Test Mode Input
M_SCAN_IN_3	I	N/A	Master Data3 Lane Scan Test Mode Input
M_SCAN_OUT_0	O	N/A	Master Data0 Lane Scan Test Mode Output

13.7.5 Interrupts

There are no interrupt signals for MIPI D-PHY block.

13.7.6 External Signals

The external signal that are associated with MIPI blocks are listed in their respective chapters.

13.7.7 Initialization

The below figure illustrates the initialization sequence.

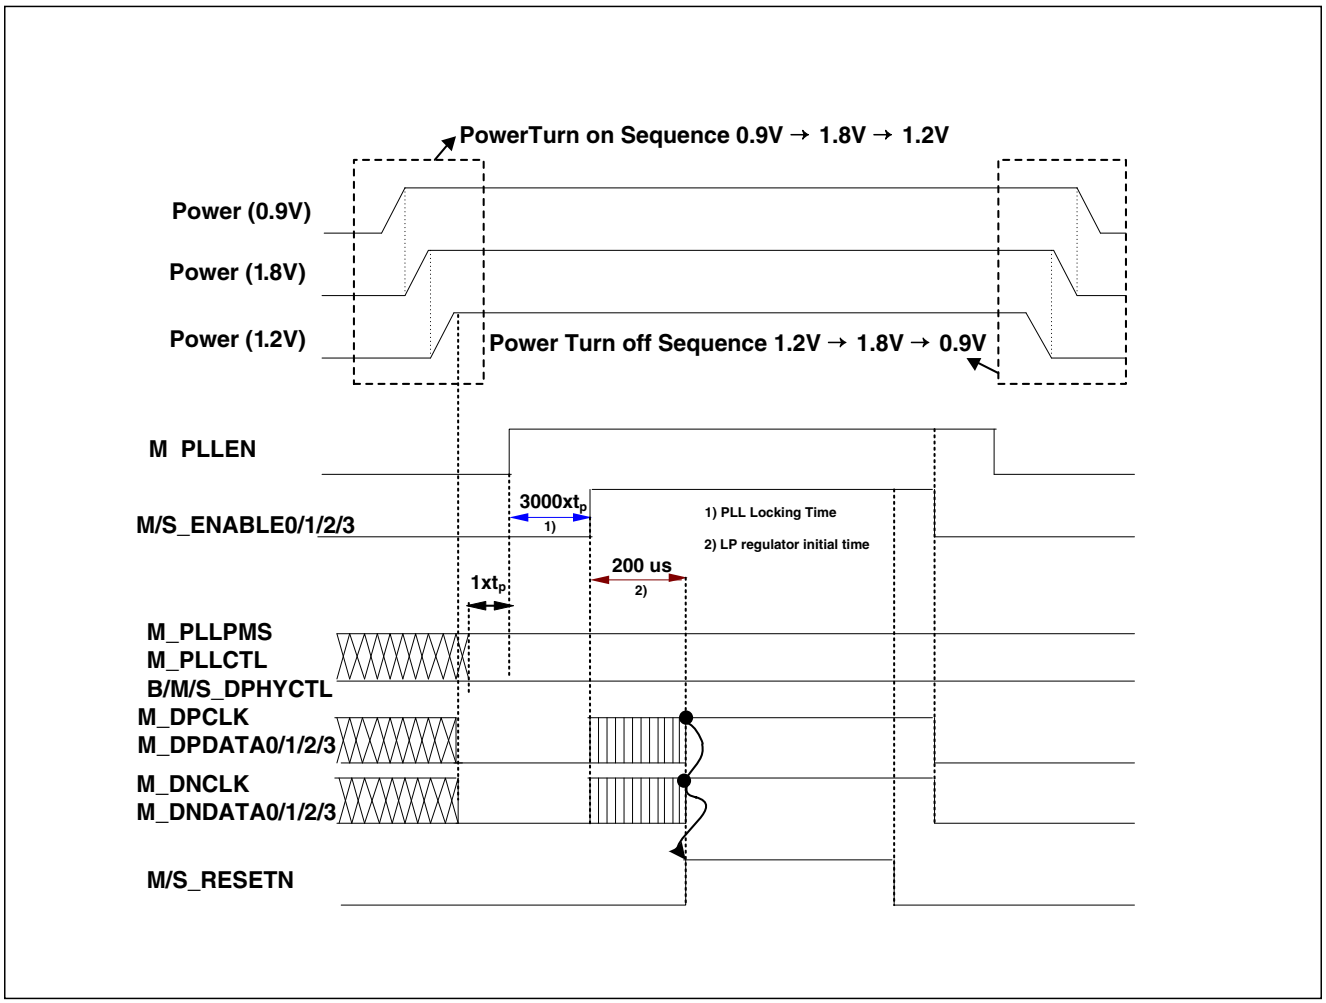

Figure 13-69. Initialization Sequence

13.7.8 MIPI PHY Memory Map/Register Definition

13.7.8.1 MIPI DPHY Register Definition

MIPI D-PHY Registers are accessed from Media Block Control module memory map registers.

13.8 LVDS Display Bridge (LDB)

13.8.1 Overview

The LVDS Display Bridge (LDB) connects to an External LVDS Display Interface.

The purpose of the LDB is to support flow of synchronous RGB data to external display devices through the LVDS interface.

13.8.1.1 Block Diagram

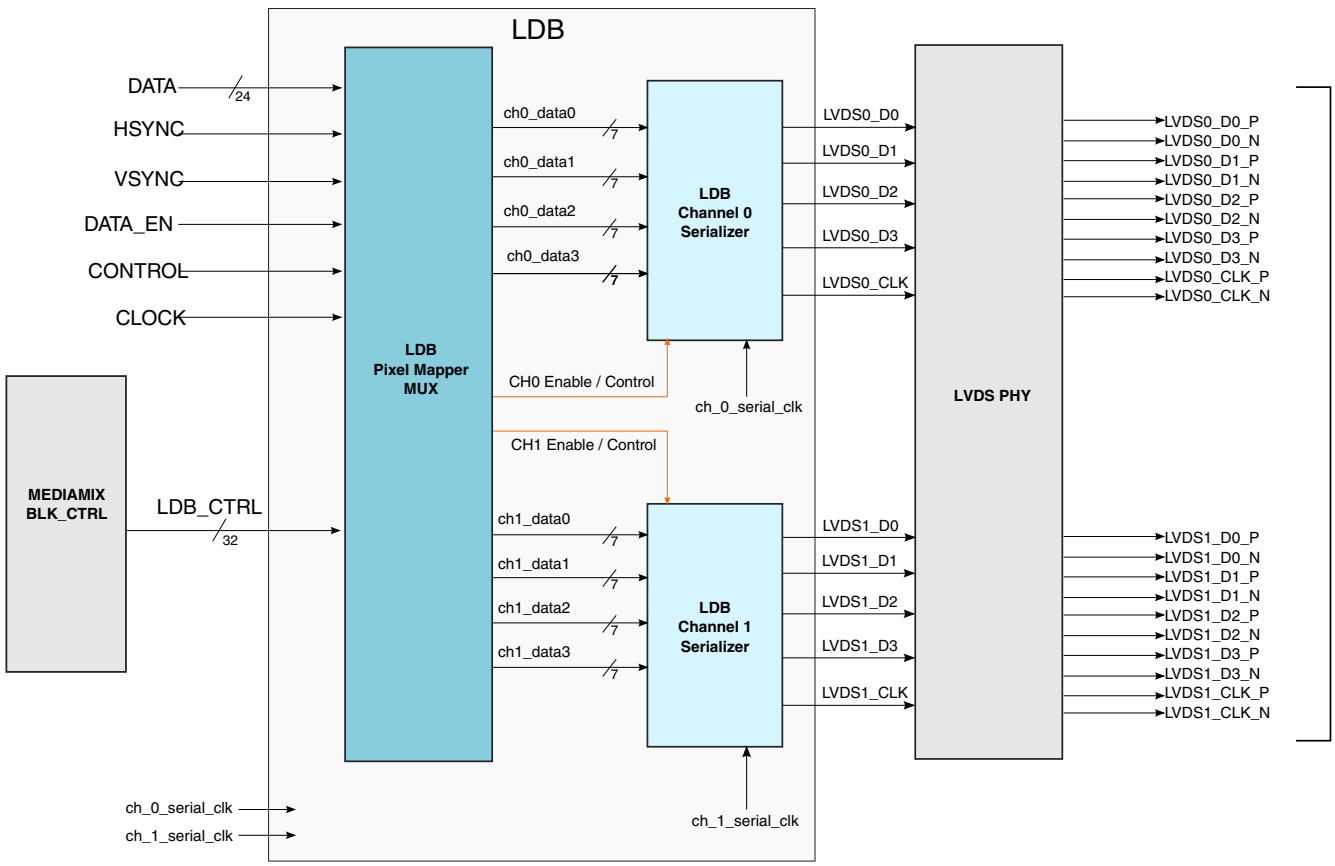

Figure 13-70. LDB Block Diagram

13.8.1.2 Features

LVDS Display Bridge block provides the following functionalities:

- Connectivity to relevant devices - Displays with LVDS receivers.
- Arranging the data as required by the external display receiver and by LVDS display standards.
- Synchronization and control capabilities.

13.8.2 Functional Description

The chip supports LVDS Tx display and Pixel Mapper. The LVDS port can be used as follows:

- Single channel (4 lanes) output at up to 80MHz pixel clock and LVDS clock. This supports resolutions up to 1366x768p60.
- For 4-lane LVDS, channel 0 or channel 1 can be used.
- Dual asynchronous channels (8 data, 2 clocks). This is intended for a single panel with two interfaces, transferring across two channels (even pixel/odd pixel). This is supported at up to 160MHz pixel clock, which is up to 80MHz LVDS clock (due to 2 pixels per LVDS clock). This supports resolutions above 1366x768p60, up to 1080p60.

The Pixel Mapper splits and reorders the pixels from the single LCDIF display output into an odd and even pixel stream. Splitting and reordering is required to match the LVDS Displays speed and channel requirements. Both VESA and JEIDA pixel mapping is supported.

The pixel mapper supports the following modes:

Table 13-33. Pixel Mapper Modes

Use Case	LVDS Channel 0	LVDS Channel 1
Single0	Display Interface(DI) of LCDIF	Disabled
Single1	Disabled	Display Interface(DI) of LCDIF
Dual	Display Interface(DI) of LCDIF	Display Interface(DI) of LCDIF
Split	Display Interface(DI) of LCDIF	Display Interface(DI) of LCDIF

13.8.2.1 Clock Signals

Table 13-34. External Signals

Signal	Description
Serial Clock	CHn Serial Clock

13.8.3 External Signals

The following table describes the external signals of LDB:

Table 13-35. LDB External Signals

Signal	Description
LVDS0_CLK_P	LVDS0 Positive Clock Signal
LVDS0_CLK_N	LVDS0 Negative Clock Signal
LVDS0_D[3:0]_P	LVDS0 Positive Data Signal
LVDS0_D[3:0]_N	LVDS0 Negative Data Signal
LVDS1_CLK_P	LVDS1 Positive Clock Signal
LVDS1_CLK_N	LVDS1 Negative Clock Signal
LVDS1_D[3:0]_P	LVDS1 Positive Data Signal
LVDS1_D[3:0]_N	LVDS1 Negative Data Signal

13.8.4 Register Map

Please refer to the MEDIAMIX BLK_CTL register (LDB_CTRL) for information to configure the Pixel Mapper modes, data widths, and data mappings.

Please refer to the MEDIAMIX BLK_CTL register (LVDS_CTRL) for information to configure band gap adjustment, output transition time and current adjustments.

13.9 HDMI TX Controller

13.9.1 Overview

The High Definition Multimedia Interface (HDMI) TX is a wired digital interconnect that replaces the analog TV out or VGA out. HDMI is capable of transferring uncompressed video, audio, and data using a single cable, compatible with the HDMI v2.0a spec. The video pixel rates are typically from 25 MHz up to 297MHz . HDMI can support a number of audio standards. It can support up to eight IEC60958 L-PCM audio channels, IEC61937 compressed non-linear PCM and HBR (high bit rate) audio interface. HDMI has the capability of automatically setting the display format configuration (intelligent link).

NOTE

The information within this block guide is Synopsys Proprietary. Used with permission.

13.9.1.1 Block diagram

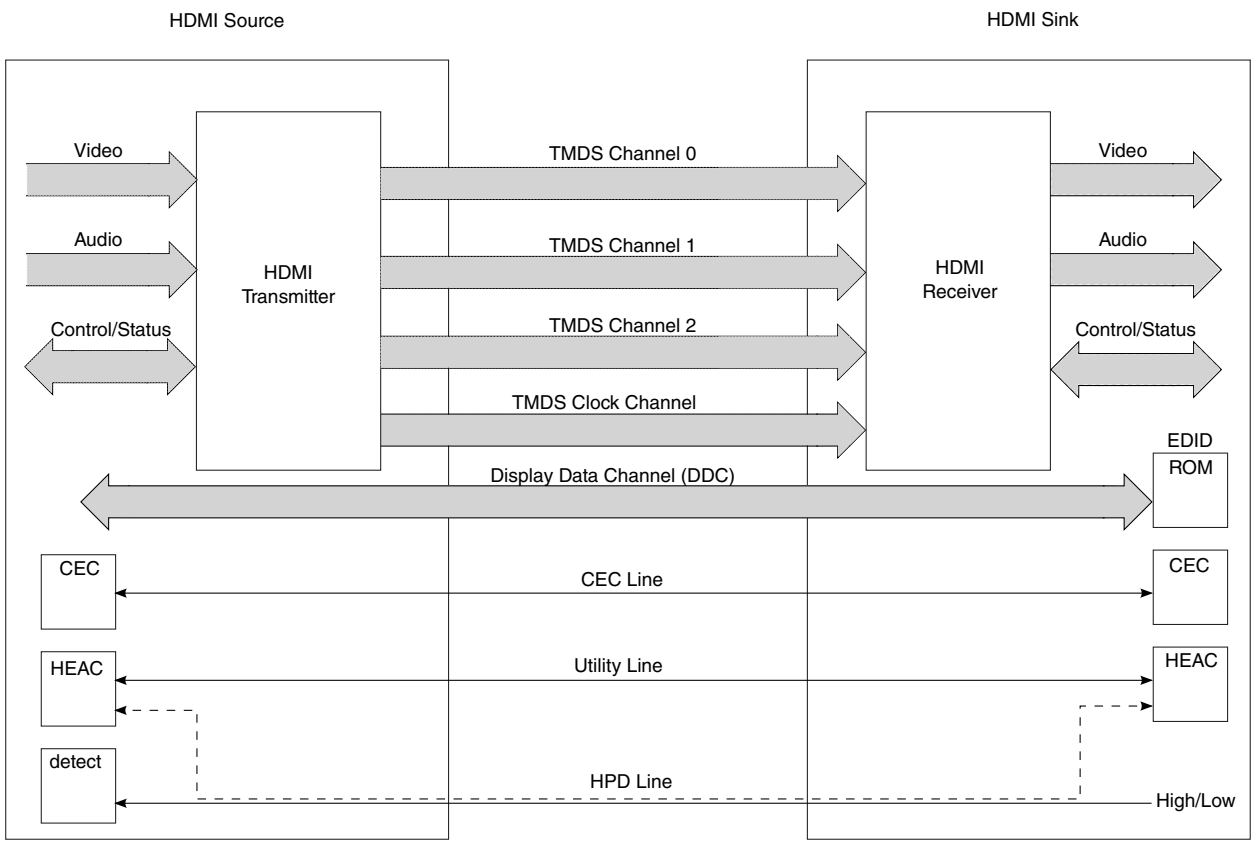

Figure 13-71. HDMI TX Controller Block Diagram

13.9.1.2 Features

HDMI TX includes the following features:

- Compatible with HDMI v2.0a spec
- Decode/encode the following video modes:
  - All 2D video formats described in the CEA-861-F specification up to 4Kp30.
- Decode/encode the following audio modes:
  - IEC 60958 or IEC 61937 Frames with an audio packet of type 0x02:

- Packets of type 0x02:
  - Layout 0 (stereo or compressed audio)
  - Layout 1 (multi-channel up to 8 channels)
- Packets of type 0x0E (Multi-stream Audio Samples)
  - Contains 2 or more streams

- High Bit Rate (HBR)
  - Packtes of type 0x09
    - DolbyTrueHD and DTS HD Master Audio formats

NOTE

HDCP is not supported.

13.9.2 Functional Description

The HDMI TX provides a variety of standard audio, video, and system interfaces.

Figure below illustrates the top level diagram of the HDMI TX solution.

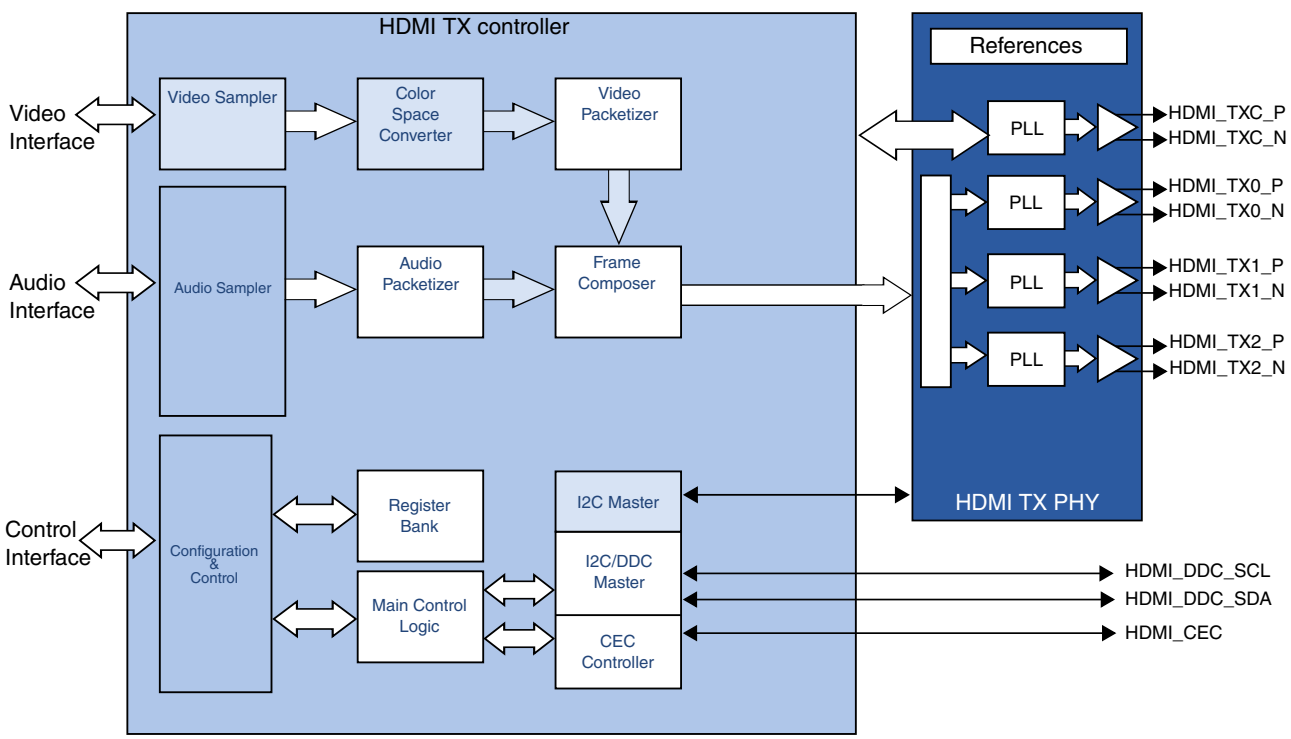

Figure 13-72. HDMI TX Top Level Block Diagram

The input video stream can be either RGB 4:4:4, YcbCr 4:2:2, or YcbCr 4:44 in single data rate (SDR) bus formats. The video mode's timing format must follow the CEA-861-E specification. An embedded color space conversion allows the pixel color format to be converted on the HDMI source side to match the best with the HDMI sink capabilities.

HDMI_TX can output video and inserts audio up to eight-channels over low resolution video formats by performing automatic pixel repetition over the input video stream.

HDMI system architecture consists of sources (transmitter) and sinks (receiver). The HDMI cable and connectors carry four differential pairs that make up the TMDS data and clock channels. These channels are used to carry video, audio, and auxiliary data. In addition, HDMI carries a VESA Data Display Channel (DDC). The DDC is used for configuration and status exchange between a single source and a single sink. The optional CEC protocol provides high-level control functions between all of the various audiovisual products in a user's environment.

Audio, video, and auxiliary data is transmitted across the three TMDS data channels. TMDS clock running, the video pixel rate is transmitted on the TMDS clock channel and used by the receiver as a frequency reference for data recovery on the three TMDS data channels. Video at the default 24-bit color depth is carried at a TMDS clock rate equal to the pixel clock rate. Higher color depths are carried using a correspondingly higher TMDS clock rate. Video formats with TMDS rates below 25MHz (such as, 13.5MHz for 480i/NTSC) can be transmitted using a pixel-repetition scheme. The video pixels can be encoded in either RGB, YCBCR 4:4:4, or YCBCR 4:2:2 formats.

HDMI uses a packet structure to transmit audio and auxiliary data across the TMDS channels. To attain the highest reliability required of audio and control data, this data is protected with a BCH error correction code and is encoded using a special error reduction code to produce the transmitted 10-bit word.

Basic audio functionality consists of a single IEC 60958 L-PCM audio stream (two audio channels) at sample rates of 32 KHz, 44.1 KHz, or 48 KHz, which can accommodate any normal stereo stream. Optionally, HDMI can carry L-PCM audio at sample rates up to 192KHz and with three to eight audio channels. HDMI can also carry an IEC 61937 compressed (such as, surround sound) audio stream at bit rates up to 49.152 Mbps. For bit rates above 6.144 Mbps, compressed audio streams conforming to IEC 61937 are carried using HBR Audio Stream Packets. Each packet carries four IEC 60958 frames, which corresponds to (4x2x16 =) 128 contiguous bits of an IEC 61937 stream.

The source uses the DDC to read the sink's Enhanced Extended Display Identification Data (E-EDID) to obtain the sink's configuration and/or capabilities.

The HDMI TX Controller schedules the three periods: Video Data Period, Data Island period, and Control period. During the Video Data Period, the active pixels of an active video line are transmitted. During the Data Island period, audio and auxiliary data are transmitted using a series of packets. The Control period is used when no video, audio, or auxiliary data needs to be transmitted. A Control Period is required between any two periods that are not Control Periods.

An example of each period placement is shown in the figure below.

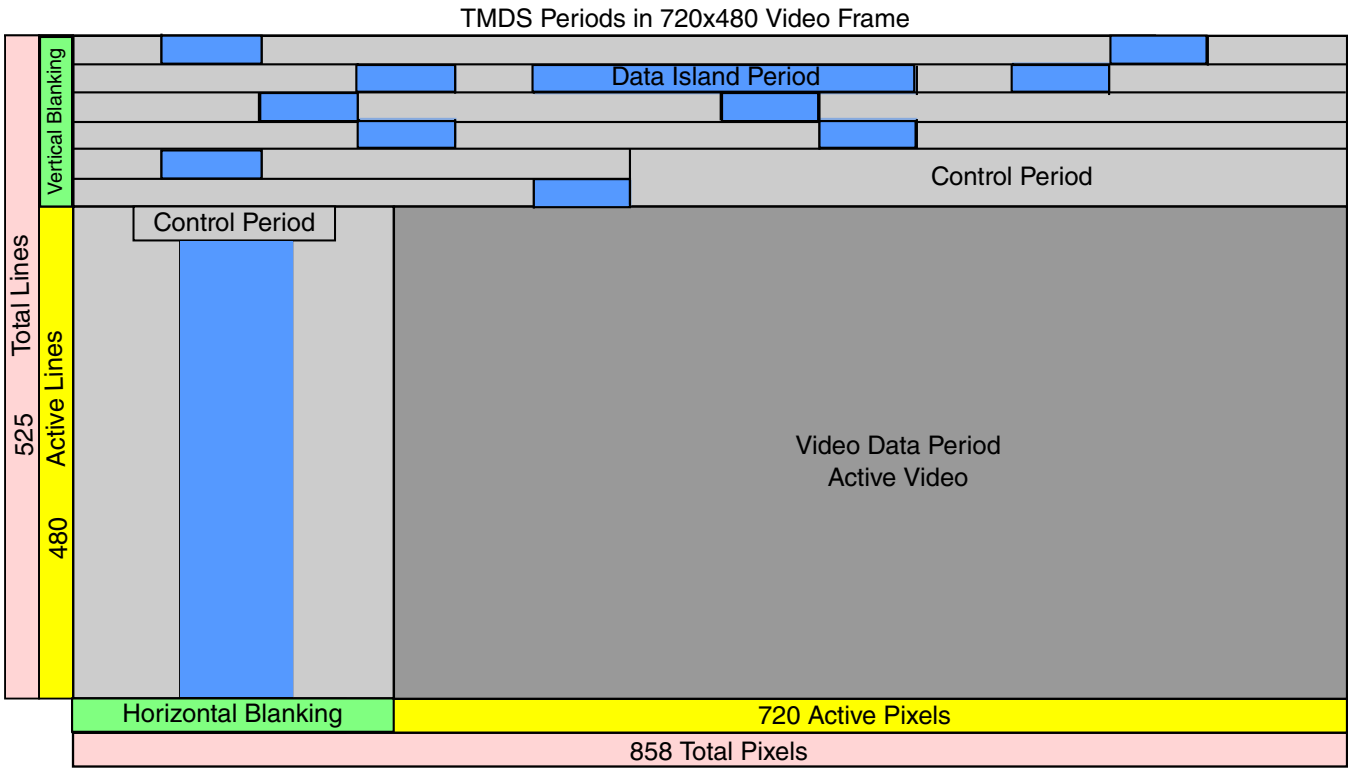

Figure 13-73. TMDS Periods in 720x480p Video Frame

13.9.2.1 Video Pixel Sampler

The Video pixel sampler block is responsible for the video data synchronization, according to the video data input mapping defined by the Color Depth (Deep Color) and format configuration.

The video pixel sampler registers base address is 0x0200 (relative to the HDMI_TX Controller base address).

For each video timing format, there is a specific timing parameters defined in the CEA-861-E specification.

The following timing diagram is an example for the video mode format 1 (640x480p @ 59.94/60 Hz): Data Enable = idataen, HSYNC = ihsync, VSYNC = ivsync.

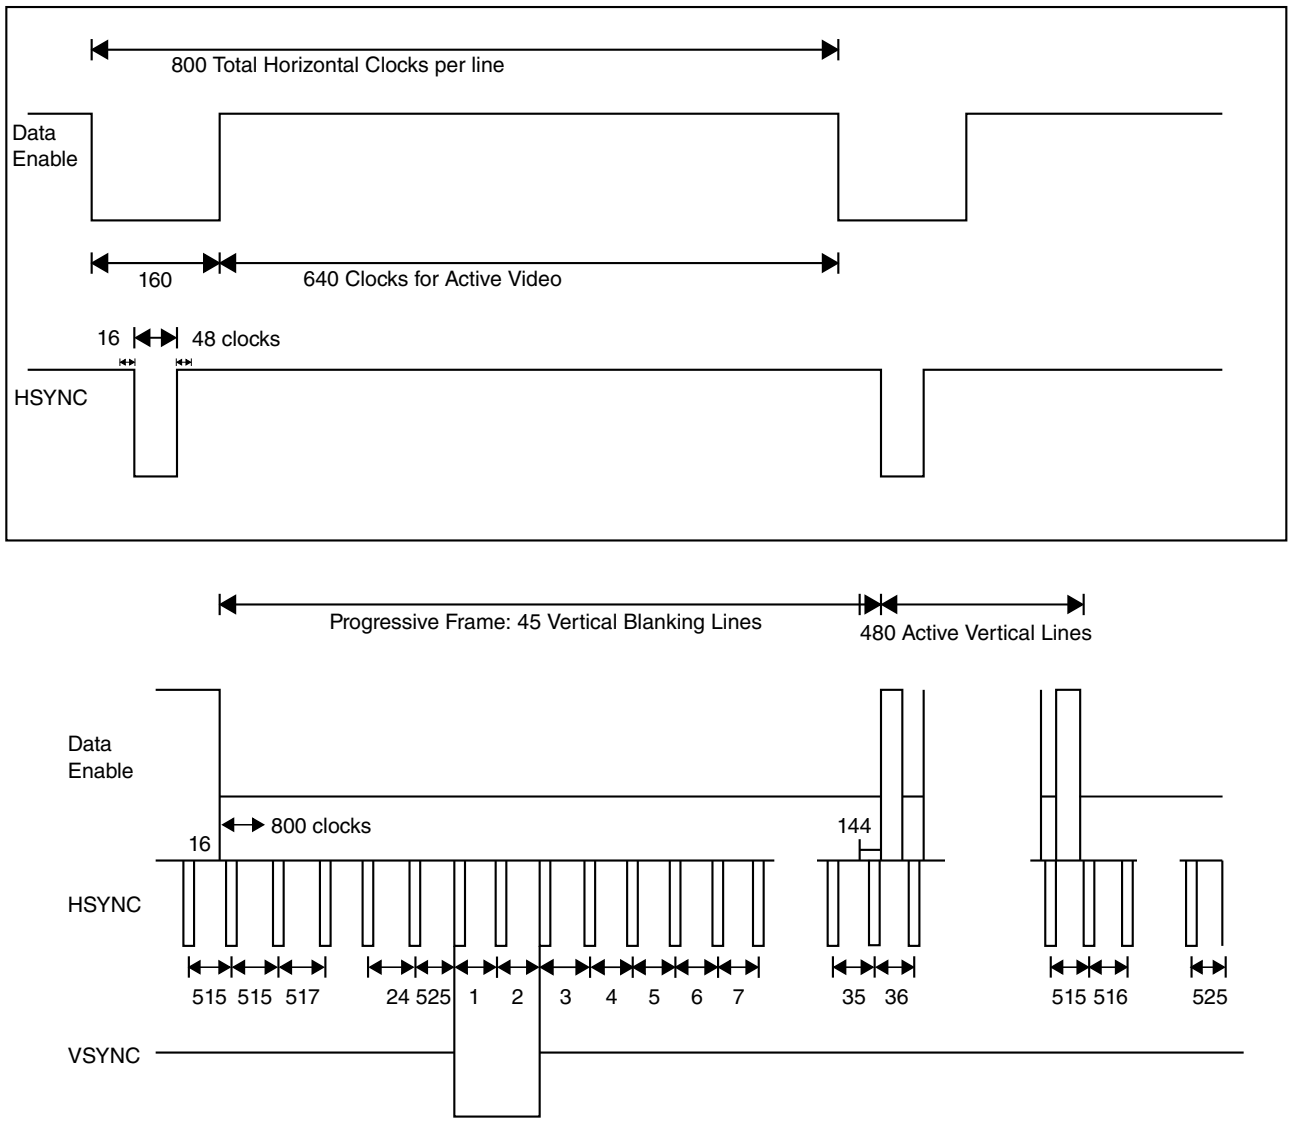

Figure 13-74. Timing Parameters for 640x480p @ 59.94/60 Hz

For a complete list of timing parameters and diagrams, refer to the CEA-861-E specification. The SDR video sample input format is illustrated in the figure below.

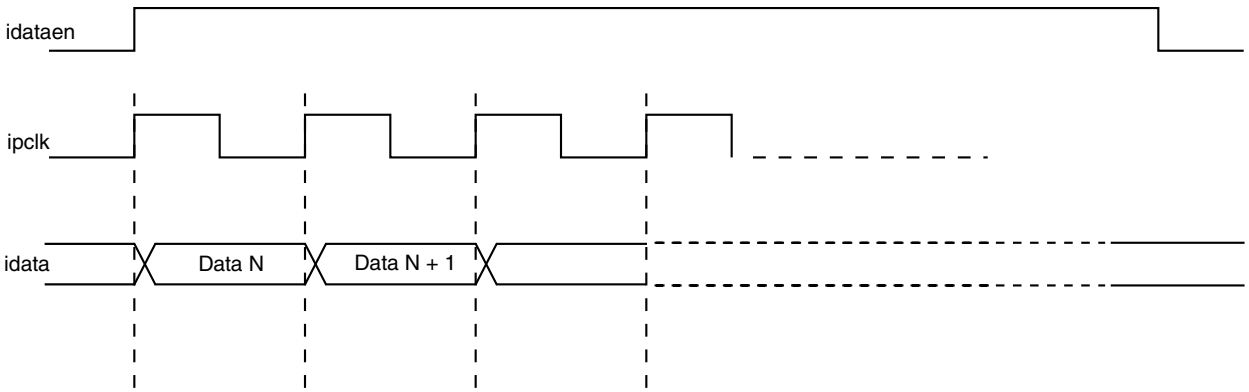

Figure 13-75. Video Sample Timing Interface for RGB and YCbCr SDR Format

13.9.2.2 Video Packetizer

This block is responsible for:

- Pixel repetition (if not already performed in the input video stream and needed by the user)
- 10-bit, 12-bit, and 16-bit packing when in deep color modes
- YCC 422 remapping according to the HDMI specification
- Clock rate transformation from pixel or repetition clock to the final TMDS clock domain (by means of FIFOs)

13.9.2.3 Color Space Conversion

This block is responsible for carrying out the following video color space conversion functions:

- RGB to/from YCbCr
- 4:2:2 to/from 4:4:4 up (pixel repetition or linear interpolation)/down-converter
- Limited to/from full quantization range conversion

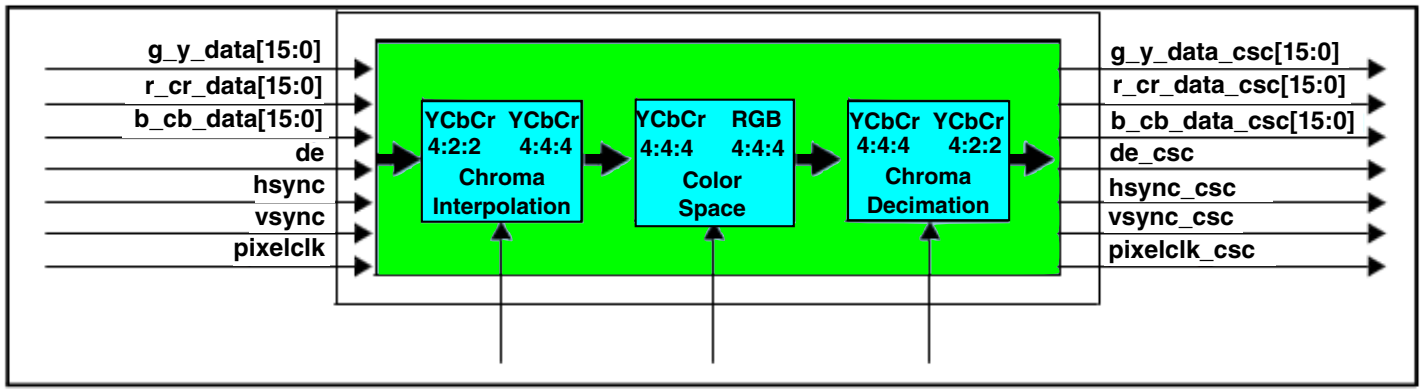

Figure 13-76. Color Space Converter Simplified Block Diagram

The color space conversion matrix is ruled by the following equations listed below. The color space conversion registers base address is 0x4100 (relative to the HDMI_TX Controller base address).

$$out_1 = (X_1 \times in_1 /4096 + X_2 \times in_2 /4096 + X_3 \times in_3 /4096 + X_4) \times 2^{(scale-2)}$$

$$out_2 = (Y_1 \times in_1 /4096 + Y_2 \times in_2 /4096 + Y_3 \times in_3 /4096 + Y_4) \times 2^{(scale-2)}$$

$$out_3 = (Z_1 \times in_1 /4096 + Z_2 \times in_2 /4096 + Z_3 \times in_3 /4096 + Z_4) \times 2^{(scale-2)}$$

13.9.2.4 Audio Interfaces

The supported audio input interface is:

- General Parallel Audio (GPA) Interface

The audio sampler registers base address is 0x3500 (relative to the HDMI_TX Controller base address).

13.9.2.4.1 Generic Parallel Audio Interface

The Generic Parallel Audio interface can be seen as an enhancement of the HBR interface.

It supports:

- Three types of Audio (L-PCM, NL-PCM, HBR).
- No Audio clock required.
- ACR information, N and CTS are configured by software, the samples are clocked-in using the system clock.

13.9.2.5 Frame Composer

This block is responsible for assembling video, audio, and data packets in a consistent frame that are streamed to the HDMI TX PHY.

The HDMI standard precisely describes the packet insertion timing and distribution that must be followed to correctly compose an HDMI TMDS (transition minimized differential signaling) stream. In this context, there are data island packets that-when available (ready for insertion in output stream)-have higher priority over others. Two packet descriptor queues are responsible for prioritizing packet insertion.

The higher priority packets are described in Table below. These packets are inserted in the output stream as soon as data to compose them is available.

Table 13-36. High Priority Data Island Packets

Packet	Description
Audio Clock Regeneration (ACR)	Indicates to sink device the N/CTS values that should be used in the ACR process
Audio Sample (AUDS)	Transports L-PCM and IEC 61937 compressed audio
General Control (GCP)	Indicates Color Depth, Pixel Packing phase, and AV mute information to sink device

The packets described in tables below can be considered as low priority packets-even though they have precise timing insertion-because their insertion timing is large (for example, one per frame or one per two frames without specific location for some of the packet types and on user request transmit for others).

Table 13-37. Low Priority Data Island Packets

Packet	Description
Audio Content Protection (ACP)	Used to convey content-related information about the active audio stream transmitted
Audio InfoFrame (AUDI)	Indicates characteristics of the active audio stream by using IEC 60958 channel status bits, IEC 61937 burst info, and/or stream data (if present).

Table continues on the next page...

Table 13-37. Low Priority Data Island Packets (continued)

Null (NULL)	Ignored by sink devices.
Vendor Specific (VSD) InfoFrame	According to CEA-861-E standard.
AVI infoFrame (AVI)	Video information from source to sink.
Source Data Product Descriptor (SPD) infoFrame	Name and product type of the source device.

The Frame Composer distributes and assembles the data island packets according to the module register bank configuration. The block allows extended control periods to appear with a certain programmed spacing. The Frame Composer uses two packet buffers that allow a packet to be composed while another is being sent to the output HDMI stream.

Packet requests are inserted into the packet queues by a data island flexible scheduler. The HDMI 1.3a specification requires that packet distribution and insertion timing correctly compose an output HDMI TMDS stream. In this context, there are data island packets that are sent on data availability, while others are sent once per frame or once per two frames. and finally others that are sent on user request. Classification of the packets according to this insertion timing is described in the table below.

Table 13-38. Packet Classification

Packet	Classification
Audio Clock Regeneration (ACR)	Sent on data availability.
Audio Sample (AUDS)	Sent on data availability (precede ACR if present).
Audio Content Protection (ACP)	On user request or automatic insertion.
Audio InfoFrame (AUDI)	Once per two frames.
Null (NULL)	On user request or automatic insertion to fill Data Island period.
General Control (GCP)	Once per frame.
International Standard Recording Code (ISRC1/ ISRC2)	On user request.
Vendor Specific (VSD) InfoFrame	On user request or automatic insertion.
AVI infoFrame (AVI)	Once per frame.
Source Data Product Descriptor (SPD) infoFrame	On user request or automatic insertion.

The Data Island Scheduler (DIS) handles packet distribution in the Frame Composer. The DIS is a round- robin (RDRB) state machine that is able to schedule packet insertion on an input video frame or line basis. The DIS is fully configurable and can schedule any packet type to be inserted at a given input video frame rate or input video line rate.

While determining packet distribution on an input video frame or line basis, the DIS schedules the packets to be inserted in the output HDMI stream by inserting the packet descriptor in the corresponding packet priority queue, according to packet priority classification.

After the packet descriptor has been inserted in the packet priority queues, the Data Island Packer (DIP) is responsible for assembling and sequencing the packets for output HDMI stream insertion.

Dedicated ECC generators and checksum byte-wide sum hardware generate the BCH ECC parity codes and infoFrames checksums for all the data islands packets.

The content of of supported packets are configured through the registers bank starting at address 0x1000 (relative to the HDMI_TX Controller base address).

13.9.2.6 EDID I²C E-DDC Interface

The Enhanced Display Data Channel (E-DDC) channel is a dedicated I2C master interface that allows the read of sink E-EDID based on system needs.

Data read from sink E-EDID can be then transferred to the I2C Master register bank, starting at address 0x7E00 (relative to the HDMI_TX Controller base address).

13.9.2.7 CEC Hardware Engine

Consumer Electronics Control (CEC) is a protocol that provides high-level control functions between all of the various audiovisual products in a user's environment.

It is an optional feature in the HDMI Specification. It uses only one bidirectional line for transmission and reception.

All transactions on the CEC line consist of an initiator and one or more followers. The initiator is responsible for sending the message structure and the data. The follower is the recipient of any data and is responsible for setting any acknowledgement bits.

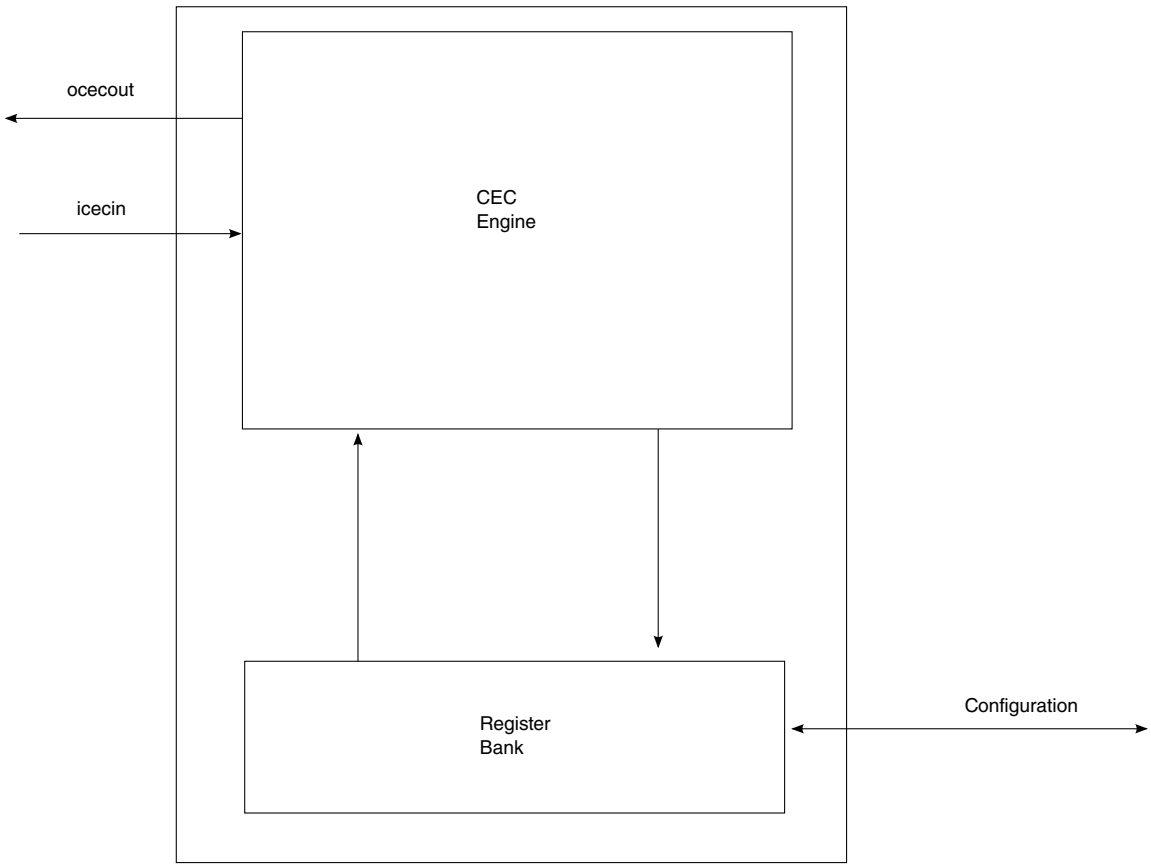

Figure 13-77. CEC Engine Simplified Block Diagram

There are two operation modes for a CEC controller.

- Initiator Mode
  - In this mode, the CEC controller sends messages out and waits for a follower to feedback. The CEC controller works in this mode when it starts to send a frame. After the transmission is done, it automatically returns to the follower mode (no software control involved).
- Follower Mode
  - In this mode, the CEC controller receives messages and feeds back the initiator with appropriate signals. The CEC controller always works in the follower mode whenever it is not transmitting any data.

The CEC engine registers base address is 0x7D00 (relative to the HDMI_TX Controller base address).

13.9.3 Memory Map and register definition

This section includes the HDMI_TX Controller module memory map and detailed descriptions of all registers.

Each set of registers in the following sections has its own base offset, which must be added to the HDMI_TX Controller base address shown below.

HDMI_TX Controller base address: 32FD_8000h

13.9.3.3.2.1 Offset

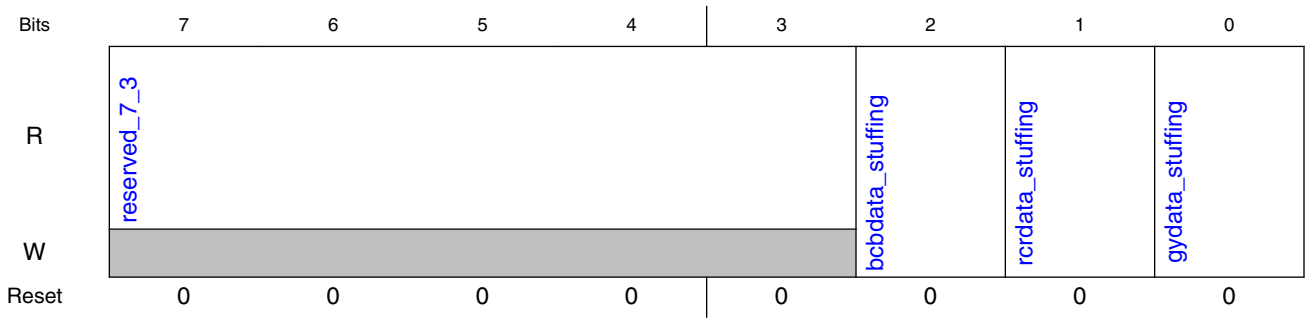
Register	Offset
tx_invid0	0h

13.9.3.3.2.2 Diagram

13.9.3.3.2.3 Fields

Field	Function
7 internal_de_generator	Internal data enable (DE) generator enable. Internal data enable (DE) generator enable. If data enable is not available for the input video, set this bit to one to activate the internal data enable generator. Attention: This feature only works for input video modes that have native repetition (such as, all CEA videos). No desired pixel repetition can be used with this feature because these configurations only affect the Frame Composer and not this block. The DE Generator does not work for the following conditions: - Transmission of video with CEA VIC 39

Table continues on the next page...



Field	Function
	- Transmission of 3D video using the field alternative structure
6-5 reserved_6_5	Reserved for future use
4-0 video_mapping	Video Input mapping (color space/color depth): 0x01: RGB 4:4:4/8 bits 0x03: RGB 4:4:4/10 bits 0x05: RGB 4:4:4/12 bits 0x07: RGB 4:4:4/16 bits 0x09: YCbCr 4:4:4 or 4:2:0/8 bits 0x0B: YCbCr 4:4:4 or 4:2:0/10 bits 0x0D: YCbCr 4:4:4 or 4:2:0/12 bits 0x0F: YCbCr 4:4:4 or 4:2:0/16 bits 0x16: YCbCr 4:2:2/8 bits 0x14: YCbCr 4:2:2/10 bits 0x12: YCbCr 4:2:2/12 bits 0x17: YCbCr 4:4:4 (IPI)/8 bits 0x18: YCbCr 4:4:4 (IPI)/10 bits 0x19: YCbCr 4:4:4 (IPI)/12 bits 0x1A: YCbCr 4:4:4 (IPI)/16 bits 0x1B: YCbCr 4:2:2 (IPI)/12 bits 0x1C: YCbCr 4:2:0 (IPI)/8 bits 0x1D: YCbCr 4:2:0 (IPI)/10 bits 0x1E: YCbCr 4:2:0 (IPI)/12 bits 0x1F: YCbCr 4:2:0 (IPI)/16 bits Note: IPI means Image Pixel Interface and it is a proprietary interface used on SNPS MIPI Controllers. Video Input mapping (color space/color depth): 0x01: RGB 4:4:4/8 bits 0x03: RGB 4:4:4/10 bits 0x05: RGB 4:4:4/12 bits 0x07: RGB 4:4:4/16 bits 0x09: YCbCr 4:4:4 or 4:2:0/8 bits 0x0B: YCbCr 4:4:4 or 4:2:0/10 bits 0x0D: YCbCr 4:4:4 or 4:2:0/12 bits 0x0F: YCbCr 4:4:4 or 4:2:0/16 bits 0x16: YCbCr 4:2:2/8 bits 0x14: YCbCr 4:2:2/10 bits 0x12: YCbCr 4:2:2/12 bits 0x17: YCbCr 4:4:4 (IPI)/8 bits 0x18: YCbCr 4:4:4 (IPI)/10 bits 0x19: YCbCr 4:4:4 (IPI)/12 bits 0x1A: YCbCr 4:4:4 (IPI)/16 bits 0x1B: YCbCr 4:2:2 (IPI)/12 bits 0x1C: YCbCr 4:2:0 (IPI)/8 bits 0x1D: YCbCr 4:2:0 (IPI)/10 bits 0x1E: YCbCr 4:2:0 (IPI)/12 bits 0x1F: YCbCr 4:2:0 (IPI)/16 bits Note: IPI means Image Pixel Interface and it is a proprietary interface used on SNPS MIPI Controllers. It allows easy video mapping between SNPS HDMI and MIPI Controllers

7-4 color_depth	The Color depth configuration is described as the following, with the action stated corresponding to color_depth[3:0]: - 0000b: 24 bits per pixel video (8 bits per component). The Color depth configuration is described as the following, with the action stated corresponding to color_depth[3:0]: - 0000b: 24 bits per pixel video (8 bits per component). 8-bit packing mode. - 0001b-0011b: Reserved. Not used. - 0100b: 24 bits per pixel video (8 bits per component). 8-bit packing mode. - 0101b: 30 bits per pixel video (10 bits per component). 10-bit packing mode. - 0110b: 36 bits per pixel video (12 bits per component). 12-bit packing mode. - 0111b: 48 bits per pixel video (16 bits per component). 16-bit packing mode. - Other: Reserved. Not used.
3-0 desired_pr_factor	Desired pixel repetition factor configuration. Desired pixel repetition factor configuration. The configured value sets H13T PHY PLL to multiply pixel clock by the factor in order to obtain the desired repetition clock. For the CEA modes some are already defined with pixel repetition in the input video. So for CEA modes this shall be always 0. Shall only be used if the user wants to do pixel repetition using H13TCTRL controller. The action is stated corresponding to desired_pr_factor[3:0]: - 0000b: No pixel repetition (pixel sent only once) - 0001b: Pixel sent two times (pixel repeated once) - 0010b: Pixel sent three times - 0011b: Pixel sent four times - 0100b: Pixel sent five times - 0101b: Pixel sent six times - 0110b: Pixel sent seven times - 0111b: Pixel sent eight times - 1000b: Pixel sent nine times - 1001b: Pixel sent 10 times - Other: Reserved. Not used

13.9.3.4.4 Video Packetizer Stuffing and Default Packing Phase Register (vp_stuff)

13.9.3.4.4.1 Offset

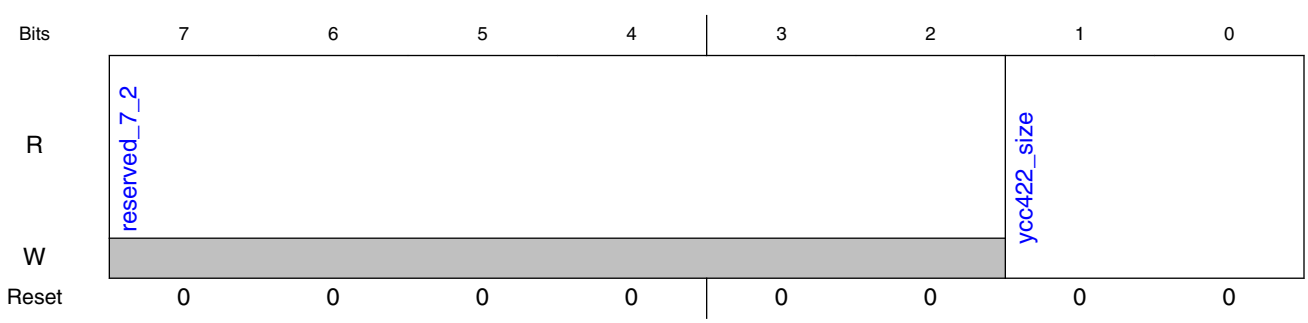
Register	Offset
vp_stuff	2h

13.9.3.4.4.2 Diagram

13.9.3.4.4.3 Fields

Field	Function
7-6 reserved_7_6	Reserved and read as zero
5 idefault_phase	Controls the default phase packing machine used according to HDMI 1. Controls the default phase packing machine used according to HDMI 1.4b specification: "If the transmitted video format has timing such that the phase of the first pixel of every Video Data Period corresponds to pixel packing phase 0 (e.g. 10P0, 12P0, 16P0), the Source may set the Default_Phase bit in the GCP. The Sink may use this bit to optimize its filtering or handling of the PP field." This means that videos that are in the below conditions: - 10bit mode, the Htotal dividable by 4, default_phase can be set 1 - 12bit mode, the Htotal dividable by 2, default_phase can be set 1
4 ifix_pp_to_last	Reserved Reserved. Controls packing machine strategy
3 icx_goto_p0_st	Reserved Reserved. Controls packing machine strategy
2 ycc422_stuffing	YCbCr 422 remap stuffing control.

Table continues on the next page...



Field	Function
	YCbCr 422 remap stuffing control. For horizontal blanking, the action is stated corresponding to ycc422_stuffing: 0b: YCbCr 422 remap block in direct mode (input blanking data goes directly to output). 1b: YCbCr 422 remap block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00.
1 pp_stuffing	Pixel packing stuffing control. Pixel packing stuffing control. The action is stated corresponding to pp_stuffing: 0b: Pixel packing block in direct mode (input blanking data goes directly to output). 1b: Pixel packing block in stuffing mode. When "de_rep" goes to low the outputs are fixed to 0x00.
0 pr_stuffing	Pixel repeater stuffing control. Pixel repeater stuffing control. The action is stated corresponding to pp_stuffing: 0b: Pixel repeater block in direct mode (input blanking data goes directly to output). 1b: Pixel repeater block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00.

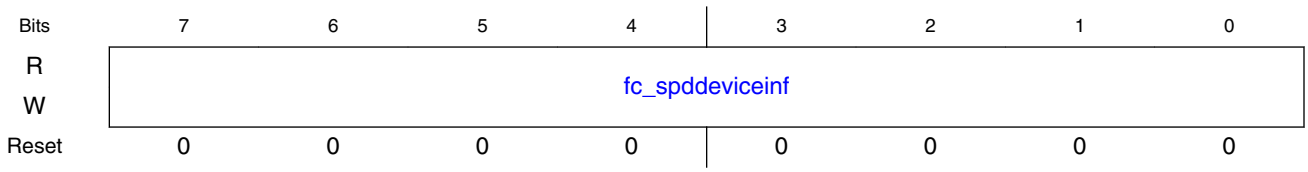
13.9.3.5.38.3 Fields



Field	Function
7-0 IEEE	This register configures the Vendor Specific InfoFrame IEEE registration identifier. This register configures the Vendor Specific InfoFrame IEEE registration identifier. For more information, refer to the CEA-861-E specification.

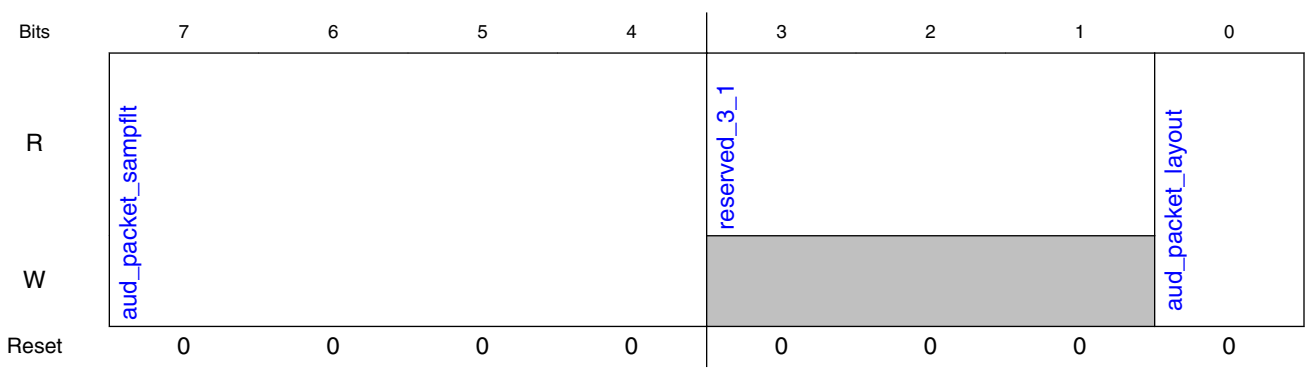
13.9.3.5.39 Frame Composer SPD Packet Data Source Product Descriptor Register (fc_spddeviceinf)

13.9.3.5.39.1 Offset

Register	Offset
fc_spddeviceinf	62h

13.9.3.5.39.2 Diagram

13.9.3.5.39.3 Fields



Field	Function
7-0 fc_spddeviceinf	Frame Composer SPD Packet Data Source Product Descriptor Register

13.9.3.5.40 Frame Composer Audio Sample Flat and Layout Configuration Register (fc_audsconf)

13.9.3.5.40.1 Offset

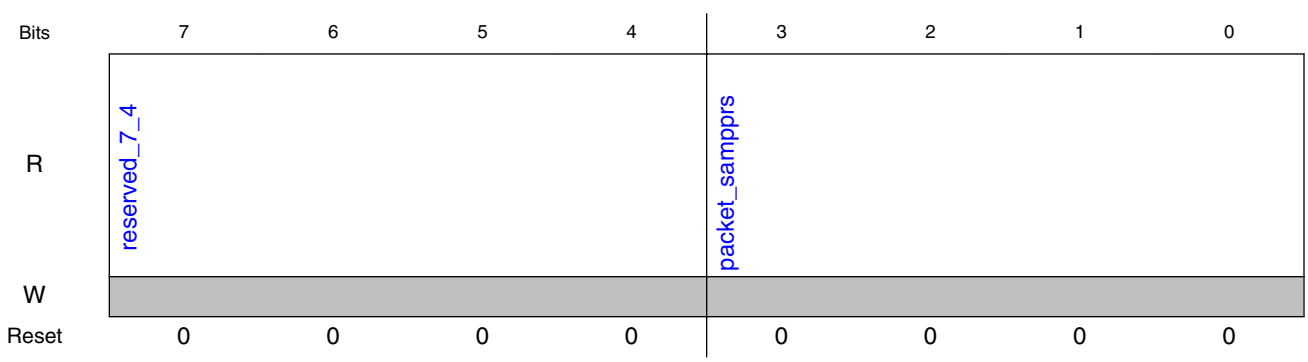
Register	Offset
fc_audsconf	63h

13.9.3.5.40.2 Diagram

13.9.3.5.40.3 Fields

Field	Function
7-4	Set the audio packet sample flat value to be sent on the packet.

Table continues on the next page...



Field	Function
aud_packet_sampflt	
3-1 reserved_3_1	Reserved and read as zero
0 aud_packet_layout	Set the audio packet layout to be sent in the packet: 1b: layout 1 0b: layout 0 If DWC_HDMI_TX_20 is defined and register field fc_multistream_ctrl. Set the audio packet layout to be sent in the packet: 1b: layout 1 0b: layout 0 If DWC_HDMI_TX_20 is defined and register field fc_multistream_ctrl.fc_mas_packet_en is active, this bit has no effect.

13.9.3.5.41 Frame Composer Audio Sample Flat and Layout Status Register (fc_audsstat)

13.9.3.5.41.1 Offset

Register	Offset
fc_audsstat	64h

13.9.3.5.41.2 Diagram

13.9.3.5.41.3 Fields

Field	Function
7-4 reserved_7_4	Reserved and read as zero

Table continues on the next page...

Field	Function
3-0 packet_sampprs	Shows the data sample present indication of the last Audio sample packet sent by the HDMI TX Controller. Shows the data sample present indication of the last Audio sample packet sent by the HDMI TX Controller. This register information is at TMDS clock rate.

13.9.3.5.42 Frame Composer Audio Sample Validity Flag Register (fc_audsv)

13.9.3.5.42.1 Offset

Register	Offset
fc_audsv	65h

13.9.3.5.105.2 Function

Frame Composer Data Island Auto Packet Scheduling Register 0

Configures the Frame Composer RDRB(1)/Manual(0) data island packet insertion for SPD, VSD, ISRC2, ISRC1 and ACP packets. On RDRB mode the described packet scheduling is controlled by registers FC_DATAUTO1 and FC_DATAUTO2, while in Manual mode register FC_DATMAN requests to FC the insertion of the requested packet.

Note: When activating auto packet scheduling, there is a possibility of sending multiple vendor-specific infoframes and violating CEA-861F.

13.9.3.5.105.3 Diagram

13.9.3.5.105.4 Fields

Field	Function
7-5 reserved_7_5	Reserved and read as zero
4 spd_auto	Enables SPD automatic packet scheduling

7-4 incoming_pr_factor	Configures the input video pixel repetition. Configures the input video pixel repetition. For CEA modes, this value must be extracted from the CEA specification for the video mode being input. incoming_pr_factor[3:0] 0000b: No action. Not used. 0001b: No pixel repetition (pixel sent only once) 0010b: Pixel sent two times (pixel repeated once) 0011b: Pixel sent three times 0100b: Pixel sent four times 0101b: Pixel sent five times 0110b: Pixel sent six times 0111b: Pixel sent seven times 1000b: Pixel sent eight times 1001b: Pixel sent nine times 1010b: Pixel sent 10 times Other: Reserved. Not used
3-0 output_pr_factor	Configures the video pixel repetition ratio to be sent on the AVI InfoFrame. Configures the video pixel repetition ratio to be sent on the AVI InfoFrame. This value must be valid according to the HDMI specification. The output_pr_factor = incoming_pr_factor * (desired_pr_factor + 1) - 1. output_pr_factor[3:0] 0000b: No action. Not used. 0001b: Pixel sent two times (pixel repeated once) 0010b: Pixel sent three times 0011b: Pixel sent four times 0100b: Pixel sent five times 0101b: Pixel sent six times 0110b: Pixel sent seven times 0111b: Pixel sent eight times 1000b: Pixel sent nine times 1001b: Pixel sent 10 times Other: Reserved. Not used Note: When working in YCbCr 422 video, the actual repetition of the stream is Incoming_pr_factor * (desired_pr_factor + 1). This calculation is done internally in the H13TCTRL and no hardware overflow protection is available. Care must be taken to avoid this result passes the maximum number of 10 pixels repeated because no HDMI support is available for this in the specification and the H13TPHY does not support this higher repetition values.

13.9.3.5.128 Frame Composer Scrambler Control (fc_scrambler_ctrl)

13.9.3.5.128.1 Offset

Register	Offset
fc_scrambler_ctrl	E1h

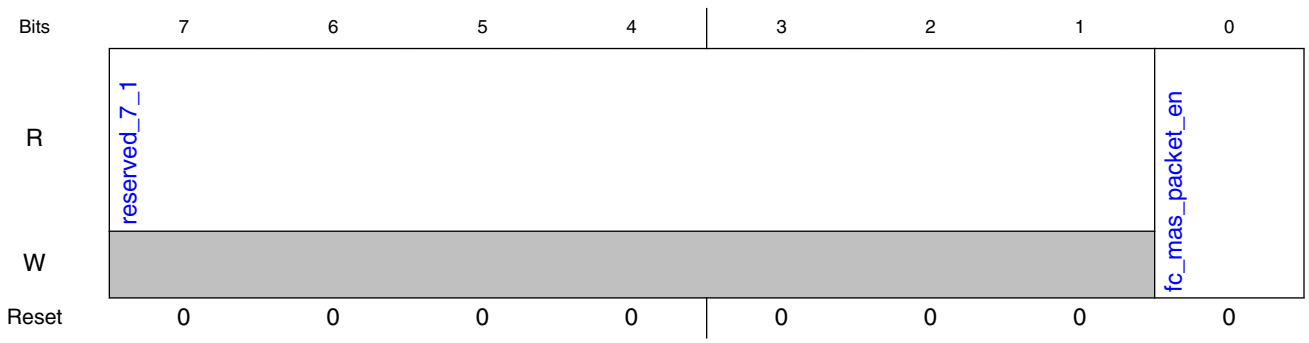
13.9.3.5.128.3 Fields



Field	Function
7-5 reserved_7_5	Reserved and read as zero
4 scrambler_ucp_line	Debug register. Debug register. When active (1'b1), the Unscrambled Control Period is generated after each active video line (non-compliant behavior). This is quasi-static field which requires a mc_swrstzreq_1.tmdsswrst_req reset request to be performed after the change of this configuration bit.
3-1 reserved_3_1	Reserved and read as zero
0 scrambler_on	When set (1'b1), this field activates the HDMI 2. When set (1'b1), this field activates the HDMI 2.0 scrambler feature. When disabled (1'b0) the scrambler feature is bypassed, placing DWC_hdmi_tx in HDMI 1.4b compatible mode. To activate the scrambler feature, you must ensure that the quasi-static configuration bit fc_invidconf.HDCP_keepout is set (1'b1) at configuration time, before the required mc_swrstzreq_1.tmdsswrst_req reset request is issued. This is field can be changed in runtime.

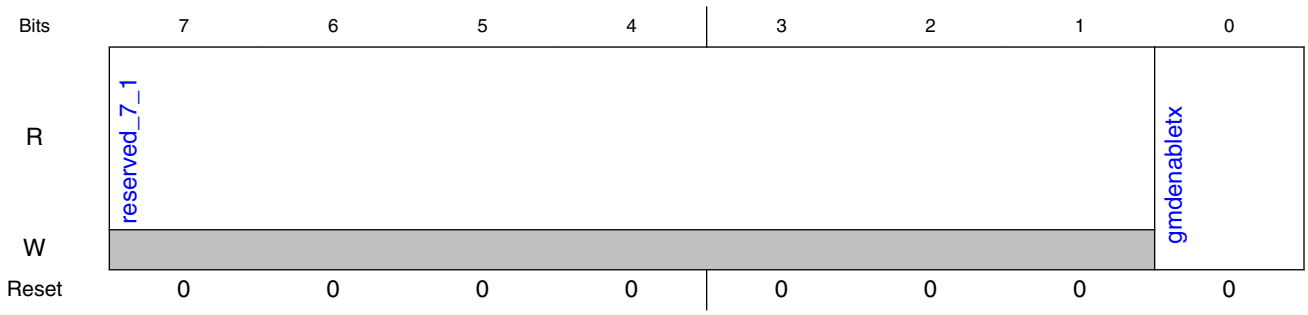
5-4 igmdpacket_seq	Gamut scheduling: Gamut packet sequence
3-0 igmdcurrent_gamut_seq_num	Gamut scheduling: Current Gamut packet sequence number

13.9.3.5.135 Frame Composer GMD Packet Enable Register This register enables Gamut metadata (GMD) packet transmission. (fc_gmd_en)

13.9.3.5.135.1 Offset



Register	Offset
fc_gmd_en	101h

13.9.3.5.135.2 Function

Frame Composer GMD Packet Enable Register

This register enables Gamut metadata (GMD) packet transmission. Packets are inserted in the incoming frame, starting in the line where active Vsync indication starts. After enable of GMD packets the outgoing packet is sent with no_current_gmd active indication until update GMD request is performed in the controller.

13.9.3.5.135.3 Diagram

13.9.3.5.135.4 Fields

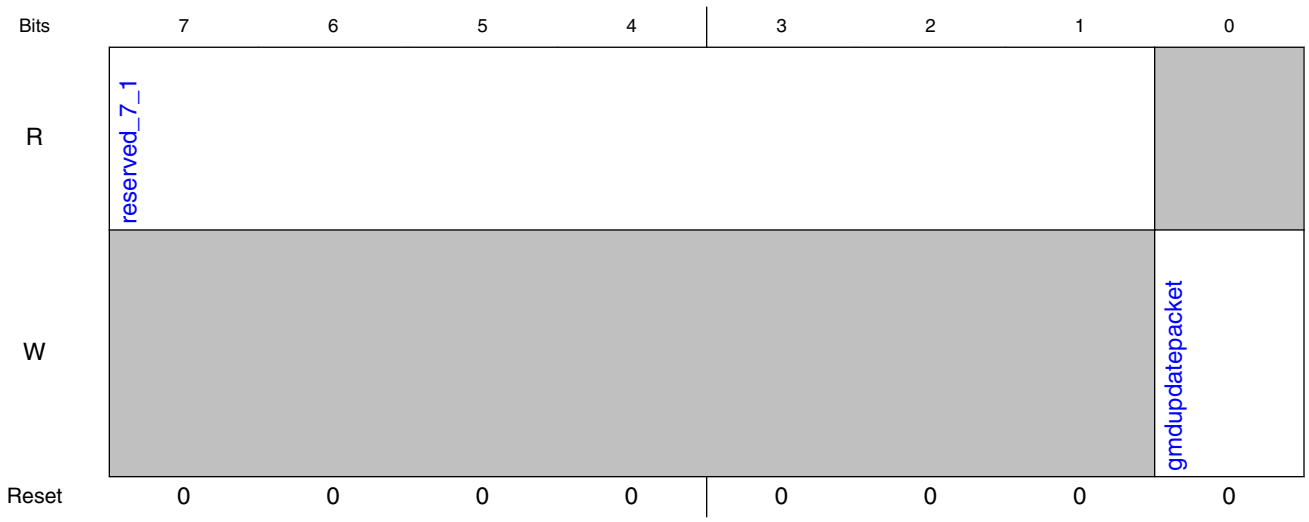
Field	Function
7-1 reserved_7_1	Reserved and read as zero
0 gmdenabletx	Gamut Metadata packet transmission enable (1b)

13.9.3.5.136 Frame Composer GMD Packet Update Register This register performs an GMD packet content update according to the configured packet body (FC_GMD_PB0 to FC_GMD_PB27) and packet header (FC_GMD_HB). (fc_gmd_up)

13.9.3.5.136.1 Offset

Register	Offset
fc_gmd_up	102h

13.9.3.5.136.2 Function



Frame Composer GMD Packet Update Register

This register performs an GMD packet content update according to the configured packet body (FC_GMD_PB0 to FC_GMD_PB27) and packet header (FC_GMD_HB). This active high auto clear register reflects the body and header configurations on the GMD packets sent arbitrating the current_gamut_seq_num, gmd_packet_sequence and

next_gmd_field bits on packet to correctly indicate to source the Gamut change to be performed. After enable GMD packets the first update request is also responsible for deactivating the no_current_gmd indication bit.

Attention packet update request must only be done after correct configuration of GMD packet body and header registers. Correct affected_gamut_seq_num and gmd_profile configuration is user responsibility and must convey with HDMI 1.4b standard gamut rules.

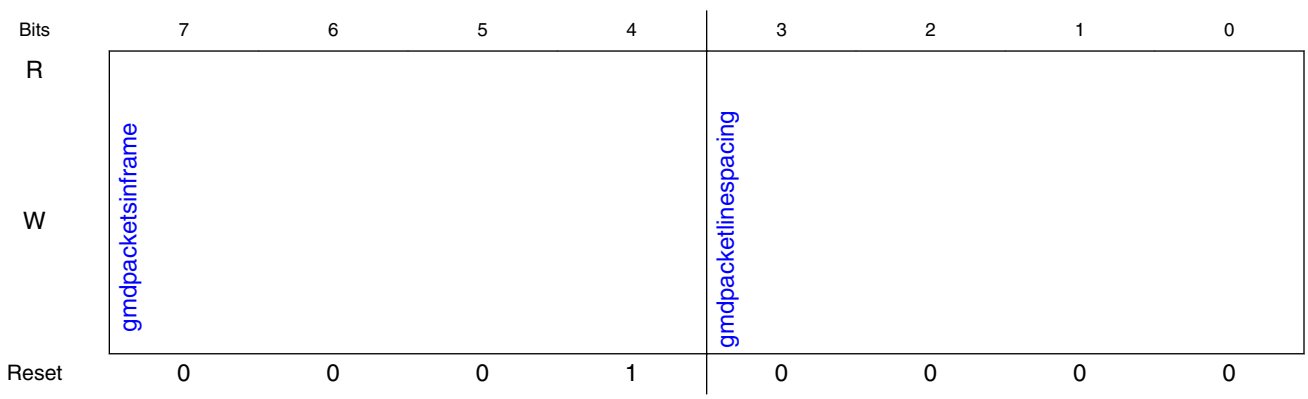
13.9.3.5.136.3 Diagram

13.9.3.5.136.4 Fields

Field	Function
7-1 reserved_7_1	Reserved and read as zero
0 gmdupdatepacket	Gamut Metadata packet update

13.9.3.5.137 Frame Composer GMD Packet Schedule Configuration Register This register configures the number of GMD packets to be inserted per frame (starting always in the line where the active Vsync appears) and the line spacing between the transmitted GMD packets. (fc_gmd_conf)

13.9.3.5.137.1 Offset



Register	Offset
fc_gmd_conf	103h

13.9.3.5.137.2 Function

Frame Composer GMD Packet Schedule Configuration Register

This register configures the number of GMD packets to be inserted per frame (starting always in the line where the active Vsync appears) and the line spacing between the transmitted GMD packets. Note that for profile P0 (refer to the HDMI 1.4b specification) this register should only indicate one GMD packet to be inserted per video field.

13.9.3.5.137.3 Diagram

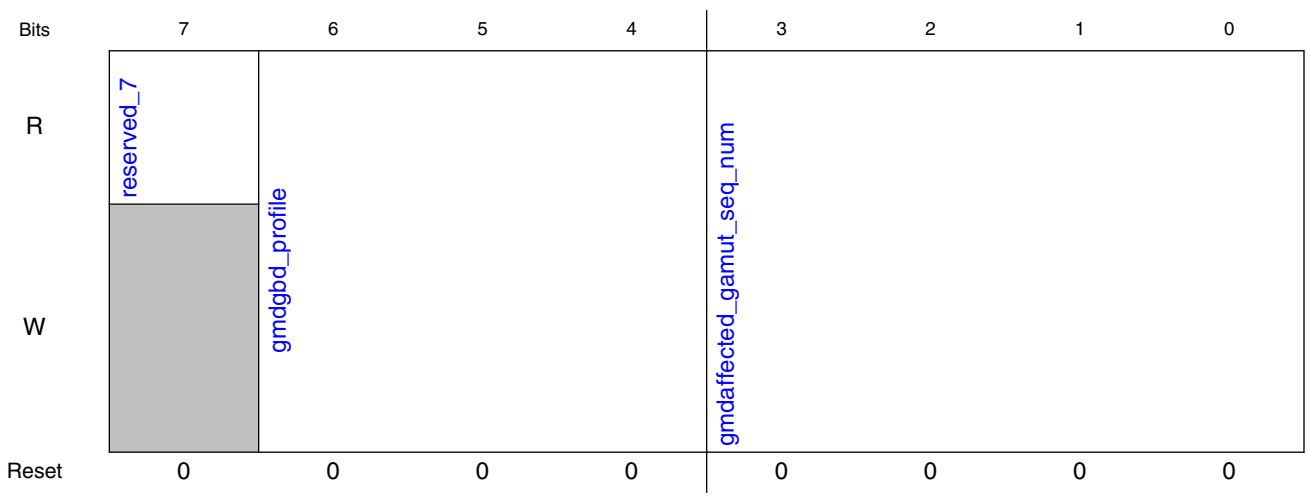
13.9.3.5.137.4 Fields

Field	Function
7-4 gmdpacketsinframe	Number of GMD packets per frame or video field (profile P0)
3-0 gmdpacketlinespacing	Number of line spacing between the transmitted GMD packets

13.9.3.5.138 Frame Composer GMD Packet Profile and Gamut Sequence Configuration Register This register configures the GMD

packet header affected_gamut_seq_num and gmd_profile bits. (fc_gmd_hb)

13.9.3.5.138.1 Offset



Register	Offset
fc_gmd_hb	104h

13.9.3.5.138.2 Function

Frame Composer GMD Packet Profile and Gamut Sequence Configuration Register

This register configures the GMD packet header affected_gamut_seq_num and gmd_profile bits. For more information, refer to the HDMI 1.4b specification.

13.9.3.5.138.3 Diagram

13.9.3.5.138.4 Fields

Field	Function
7 reserved_7	Reserved and read as zero
6-4 gmdgbd_profile	GMD profile bits. GMD profile bits. DWC_hdmi_tx only supports Profile 0 (P0) of the Gamut Boundary Description Metadata Profiles described in the HDMI 1.4 Specification (which defines four profiles, P0-P4).
3-0 gmdaffected_gamut_seq_num	Affected gamut sequence number

Field	Function
7 RX_SENSE_3	Status bit. Status bit. TX PHY RX_SENSE indication for TMDS channel 3 driver. You may need to mask or change polarity of this interrupt after it has became active.
6 RX_SENSE_2	Status bit. Status bit. TX PHY RX_SENSE indication for TMDS channel 2 driver. You may need to mask or change polarity of this interrupt after it has became active.
5 RX_SENSE_1	Status bit. Status bit. TX PHY RX_SENSE indication for TMDS channel 1 driver. You may need to mask or change polarity of this interrupt after it has became active.
4 RX_SENSE_0	Status bit. Status bit. TX PHY RX_SENSE indication for TMDS channel 0 driver. You may need to mask or change polarity of this interrupt after it has became active.
3-2 reserved_3_2	Reserved and read as zero
1 HPD	Status bit. Status bit. HDMI Hot Plug Detect indication. You may need to mask or change polarity of this interrupt after it has became active.
0 TX_PHY_LOCK	Status bit. Status bit. TX PHY PLL lock indication. For more information, refer to the PHY databook. You may need to mask or change polarity of this interrupt after it has became active.

13.9.3.6.7 PHY RXSENSE, PLL Lock, and HPD Interrupt Register This register contains the interrupt indication of the PHY_STAT0 status interrupts. (phy_int0)

13.9.3.6.7.1 Offset

Register	Offset
phy_int0	5h

13.9.3.6.7.2 Function

PHY RXSENSE, PLL Lock, and HPD Interrupt Register

This register contains the interrupt indication of the PHY_STAT0 status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All these interrupts are forwarded to the Interrupt Handler sticky bit register ih_phy_stat0 and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

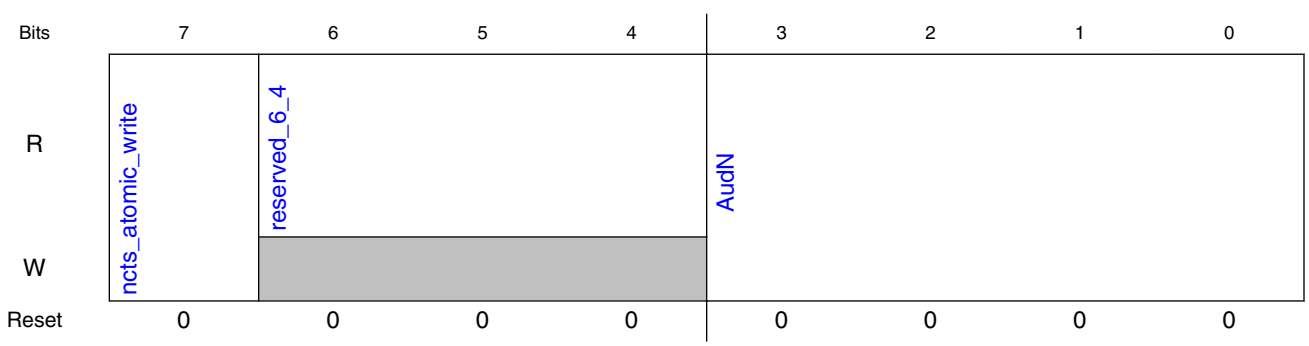
13.9.3.7.4.1 Offset



Register	Offset
aud_n3	2h

13.9.3.7.4.2 Function

Audio Clock Regenerator N Value Register 3

For N expected values, refer to the HDMI 1.4b specification.

13.9.3.7.4.3 Diagram

13.9.3.7.4.4 Fields

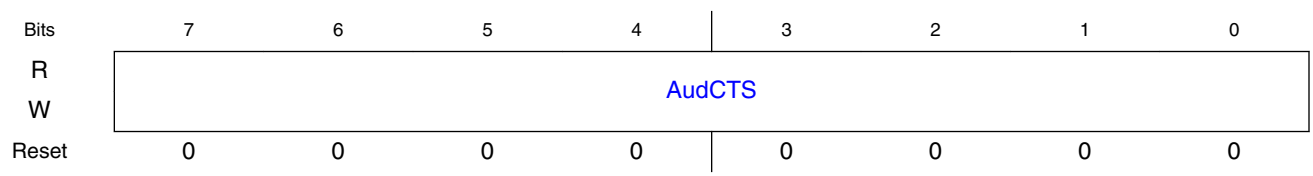
Field	Function
7	When set, the new N and CTS values are only used when aud_n1 register is written.
ncts_atomic_write	When set, the new N and CTS values are only used when aud_n1 register is written. If clear, N and CTS data is updated each time a new N or CTS byte is written. The following write sequence is recommended:

Table continues on the next page...

Field	Function
	1. aud_n3 (set bit ncts_atomic_write if desired) 2. aud_cts3 (set CTS_manual and CTS value if desired/enabled) 3. aud_cts2 (required in CTS_manual) 4. aud_cts1 (required in CTS_manual) 5. aud_n3 (bit ncts_atomic_write with same value as in step 1.) 6. aud_n2 7. aud_n1 For dynamic N/CTS changes, perform only steps from 2-7 or 5-7 depending on the state of CTS_manual.
6-4 reserved_6_4	Reserved and read as zero
3-0 AudN	HDMI Audio Clock Regenerator N value

13.9.3.7.5 Audio Clock Regenerator CTS Value Register 1 For CTS expected values, refer to the HDMI 1. (aud_cts1)

13.9.3.7.5.1 Offset



Register	Offset
aud_cts1	3h

13.9.3.7.5.2 Function

Audio Clock Regenerator CTS Value Register 1

For CTS expected values, refer to the HDMI 1.4b specification.

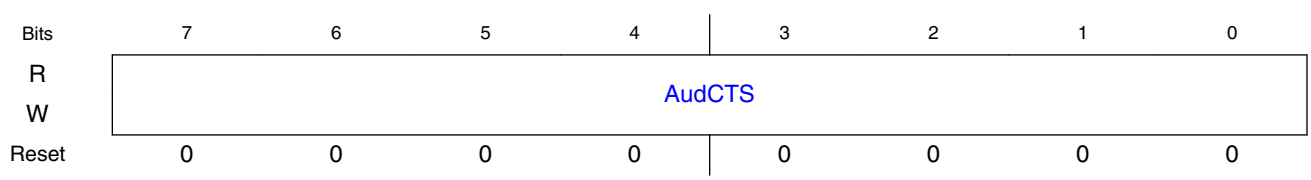
13.9.3.7.5.3 Diagram

13.9.3.7.5.4 Fields

Field	Function
7-0 AudCTS	HDMI Audio Clock Regenerator CTS calculated value. HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

13.9.3.7.6 Audio Clock Regenerator CTS Register 2 For CTS expected values, refer to the HDMI 1. (aud_cts2)

13.9.3.7.6.1 Offset



Register	Offset
aud_cts2	4h

13.9.3.7.6.2 Function

Audio Clock Regenerator CTS Register 2

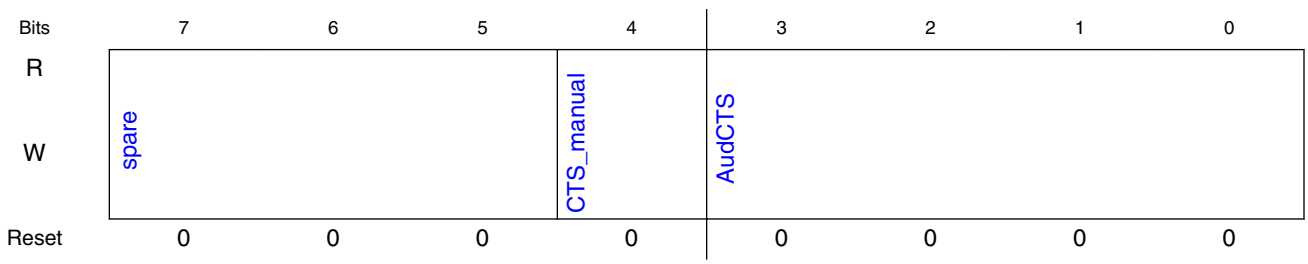
For CTS expected values, refer to the HDMI 1.4b specification.

13.9.3.7.6.3 Diagram

13.9.3.7.6.4 Fields

Field	Function
7-0 AudCTS	HDMI Audio Clock Regenerator CTS calculated value. HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

13.9.3.7.7 Audio Clock Regenerator CTS value Register 3. (aud_cts3)



13.9.3.7.7.1 Offset

Register	Offset
aud_cts3	5h

13.9.3.7.7.2 Function

Audio Clock Regenerator CTS value Register 3. For CTS expected values, refer to the HDMI 1.4b specification.

13.9.3.7.7.3 Diagram

13.9.3.7.7.4 Fields

Field	Function
7-5 spare	Reserved as "spare" bit with no associated functionality.
4 CTS_manual	If the CTS_manual bit equals 0b, this registers contains audCTS[19:0] generated by the Cycle time counter according to the specified timing. If the CTS_manual bit equals 0b, this registers contains audCTS[19:0] generated by the Cycle time counter according to the specified timing. If the CTS_manual bit equals 1b, this register is configured with the audCTS[7:0] value that is output by the Audio Packetizer. Note: When the General Parallel Audio Interface (GPAUD) is enabled (AUDIO_IF = 6) or the AHB DMA Audio Interface is enabled (AUDIO_IF = 8), writing to these bits has no effect; reading these bits always return 0.
3-0 AudCTS	HDMI Audio Clock Regenerator CTS calculated value. HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

13.9.3.7.8 Audio Input Clock FS Factor Register (aud_inputclkfs)

13.9.3.7.8.1 Offset

Register	Offset
aud_inputclkfs	6h

13.9.3.7.8.2 Diagram

2-0 reserved_2_0	Reserved and read as zero

13.9.3.7.9 Audio CTS Dither Register (aud_cts_dither)

13.9.3.7.9.1 Offset

Register	Offset
aud_cts_dither	7h

13.9.3.7.9.2 Diagram

Bits	7	6	5	4	3	2	1	0
R W	dividend				divisor			
Reset	0	0	0	1	0	0	0	1

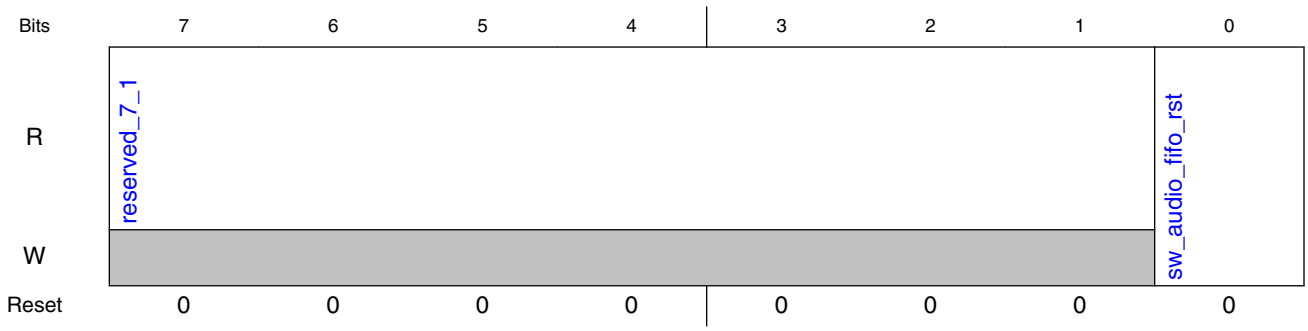
13.9.3.7.9.3 Fields

Field	Function
7-4 dividend	Dither dividend (4'd1 if no CTS Dither) This field should be configured with the value of dividend from the HDMI specification. Dither dividend (4'd1 if no CTS Dither) This field should be configured with the value of dividend from the HDMI specification. Note: This value is only meaningful when operating in N/CTS manual mode. Value 4'd0 is not supported.
3-0 divisor	Dither divisor (4'd1 if no CTS Dither) This field should be configured with the value of divisor from the HDMI specification. Dither divisor (4'd1 if no CTS Dither) This field should be configured with the value of divisor from the HDMI specification. Note: This value is only meaningful when operating in N/CTS manual mode. Value 4'd0 is not supported.

13.9.3.8 AudioSampleGP register descriptions

13.9.3.8.1 Memory map

AudioSampleGP registers base address: 3500h



Offset	Register	Width (In bits)	Access	Reset value
0h	Audio GPA Software FIFO Reset Control Register 0 (gp_conf0)	8	RW	00h
1h	Audio GPA Channel Enable Configuration Register 1 (gp_conf1)	8	RW	00h
2h	Audio GPA HBR Enable Register 2 (gp_conf2)	8	RW	00h
6h	Audio GPA FIFO Full and Empty Mask Interrupt Register (gp_mask)	8	RW	10h

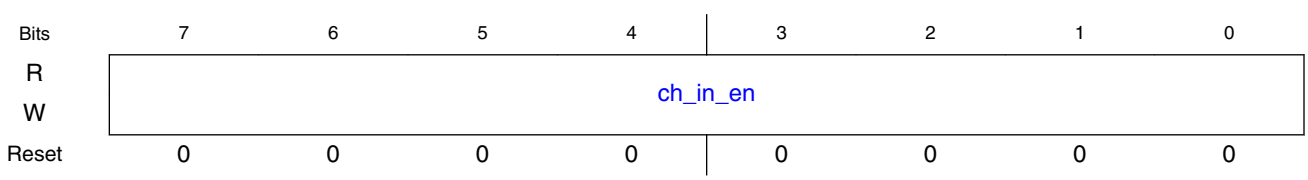
13.9.3.8.2 Audio GPA Software FIFO Reset Control Register 0 (gp_conf0)

13.9.3.8.2.1 Offset

Register	Offset
gp_conf0	0h

13.9.3.8.2.2 Diagram

13.9.3.8.2.3 Fields



Field	Function
7-1 reserved_7_1	Reserved and read as zero
0 sw_audio_fifo_rst	Audio FIFOs software reset - Writing 0b: no action taken - Writing 1b: Resets all audio FIFOs Reading from this register always returns 0b. Audio FIFOs software reset - Writing 0b: no action taken - Writing 1b: Resets all audio FIFOs Reading from this register always returns 0b. Note: If a FIFO reset request (via register write command) lands in the middle of an GPAUD audio transaction, the samples become misaligned (left-right sequence lost). As a solution, for each FIFO reset, an associated SPDIF reset must be issued (writing 8'h7F to MC_SWRSTZ register).

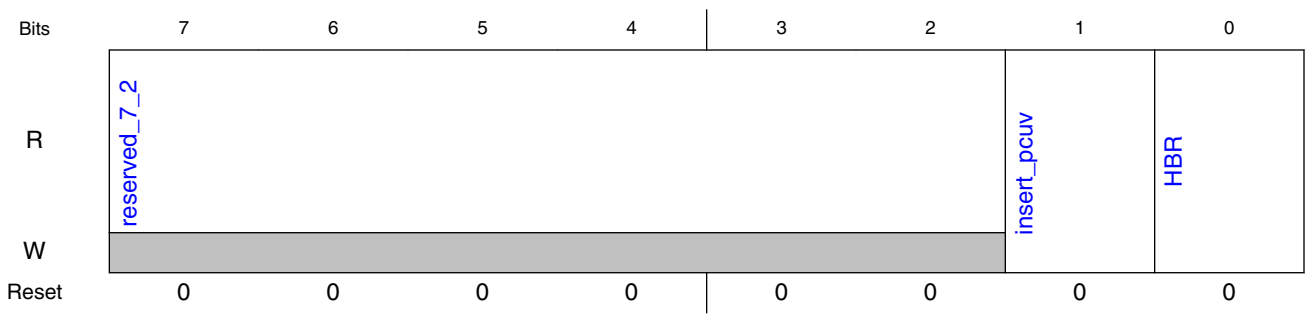
13.9.3.8.3 Audio GPA Channel Enable Configuration Register 1 (gp_conf1)

13.9.3.8.3.1 Offset

Register	Offset
gp_conf1	1h

13.9.3.8.3.2 Diagram

13.9.3.8.3.3 Fields



Field	Function
7-0 ch_in_en	Each bit controls the enabling of the respective audio channel. Each bit controls the enabling of the respective audio channel. For instance, bit 1, when set (1'b1), the audio Channel 1 is enabled. When cleared, the referred channel is disabled.

13.9.3.8.4 Audio GPA HBR Enable Register 2 (gp_conf2)

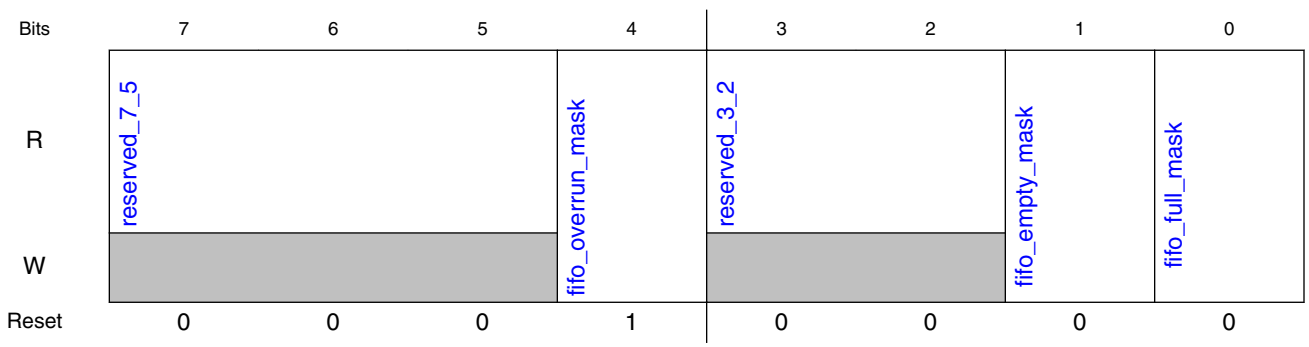
13.9.3.8.4.1 Offset

Register	Offset
gp_conf2	2h

13.9.3.8.4.2 Diagram

13.9.3.8.4.3 Fields

Field	Function
7-2 reserved_7_2	Reserved and read as zero
1 insert_pcuv	When set (1'b1), this bit enables the insertion of the PCUV (Parity, Channel Status, User bit and Validity) bits on the incoming audio stream (support limited to Linear PCM audio). When set (1'b1), this bit enables the insertion of the PCUV (Parity, Channel Status, User bit and Validity) bits on the incoming audio stream (support limited to Linear PCM audio). If disabled, the incoming audio stream must contain the PCUV bits, mapped according to 2.6.4.2 Data Mapping Examples.
0 HBR	HBR packets enable.



Field	Function
	HBR packets enable. The DWC_hdmi_tx sends the HBR packets. This bit is enabled when the audio frequency is higher than 192 kHz. If this bit is enabled, the number of channels configured in GP_CONF1 must be set to 8'hFF.

13.9.3.8.5 Audio GPA FIFO Full and Empty Mask Interrupt Register (gp_mask)

13.9.3.8.5.1 Offset

Register	Offset
gp_mask	6h

13.9.3.8.5.2 Diagram

13.9.3.8.5.3 Fields

Field	Function
7-5 reserved_7_5	Reserved and read as zero
4 fifo_overrun_mask	FIFO overrun mask
3-2 reserved_3_2	Reserved and read as zero
1 fifo_empty_mask	FIFO empty flag mask
0 fifo_full_mask	FIFO full flag mask

13.9.3.9 MainController register descriptions

13.9.3.9.1 Memory map

MainController registers base address: 4000h

Offset	Register	Width (In bits)	Access	Reset value
1h	Main Controller Synchronous Clock Domain Disable Register (mc_clkdis)	8	RW	Table 13-125
2h	Main Controller Software Reset Register Main controller software reset request per clock domain. (mc_swrstzreq_1)	8	RW	Table 13-125

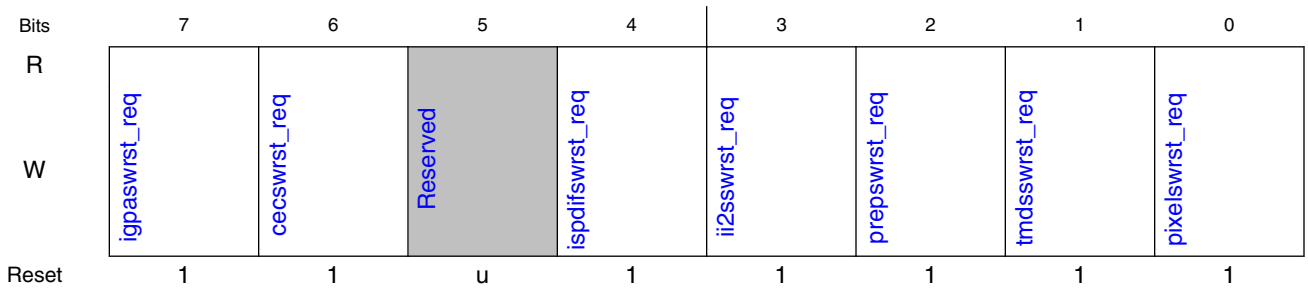
13.9.3.9.2.3 Fields

Field	Function
7 —	Reserved
6 —	Reserved
5 cecclk_disable	CEC Engine clock synchronous disable signal.
4 cscclk_disable	Color Space Converter clock synchronous disable signal.
3 audclk_disable	Audio Sampler clock synchronous disable signal.
2 prepclk_disable	Pixel Repetition clock synchronous disable signal.
1 tmdsclk_disable	TMDS clock synchronous disable signal. TMDS clock synchronous disable signal. It is required to perform a write action on one of the following registers: - fc_invidconf, fc_inhactiv0, fc_inhactiv1, fc_inhblank0, fc_inhblank1, fc_invactiv0 - fc_invactiv1, fc_invblank, fc_hsyncindelay0, fc_hsyncindelay1, fc_hsyncinwidth0 - fc_hsyncinwidth1, fc_vsyncindelay, fc_vsyncinwidth, fc_ctrldur, fc_exctrldur, fc_exctrlspac
0 pixelclk_disable	Pixel clock synchronous disable signal.

13.9.3.9.3 Main Controller Software Reset Register Main controller software reset request per clock domain. (mc_swrstzreq_1)

13.9.3.9.3.1 Offset



Register	Offset
mc_swrstzreq_1	2h

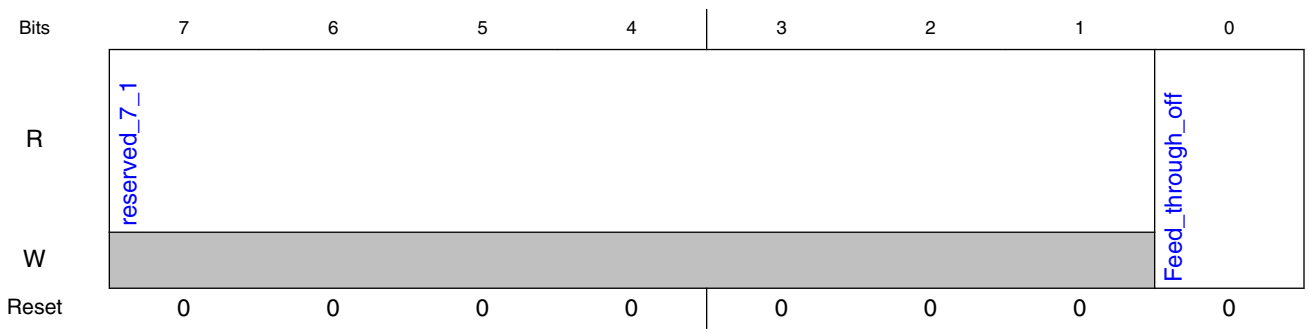
13.9.3.9.3.2 Function

Main Controller Software Reset Register

Main controller software reset request per clock domain. Writing zero to a bit of this register results in an NRZ signal toggle at sfrclk rate to an output signal that indicates a software reset request. This toggle must be used to generate a synchronized reset to de corresponding domain, with at least 1 clock cycle.

13.9.3.9.3.3 Diagram

13.9.3.9.3.4 Fields



Field	Function
7 igpaswrst_req	GPAUD interface soft reset request. GPAUD interface soft reset request. This bit is enabled when the Generic Parallel Audio (GPAUD) interface is enabled (AUDIO_IF = 6). Otherwise, this bit returns zero.
6 cecswrst_req	CEC software reset request. CEC software reset request. Defaults back to 1b after reset request. Note: After you configure cecswrst_req, set the value of the bit csc_clk_disable of the register mc_clkdis to 1, 0, and then 1 again.
5 —	Reserved
4 ispdifswrst_req	SPDIF audio software reset request.
3 ii2sswrst_req	I2S audio software reset request.
2 prepswrst_req	Pixel Repetition software reset request.
1 tmdsswrst_req	TMDS software reset request. TMDS software reset request. It is required to perform a write action on one of the following registers: - fc_invidconf, fc_inhactiv0, fc_inhactiv1, fc_inhblank0, fc_inhblank1, fc_invactiv0 - fc_invactiv1, fc_invblank, fc_hsyncindelay0, fc_hsyncindelay1, fc_hsyncinwidth0 - fc_hsyncinwidth1, fc_vsyncindelay, fc_vsyncinwidth, fc_ctrldur, fc_exctrldur, fc_exctrlspac
0 pixelswrst_req	Pixel software reset request.

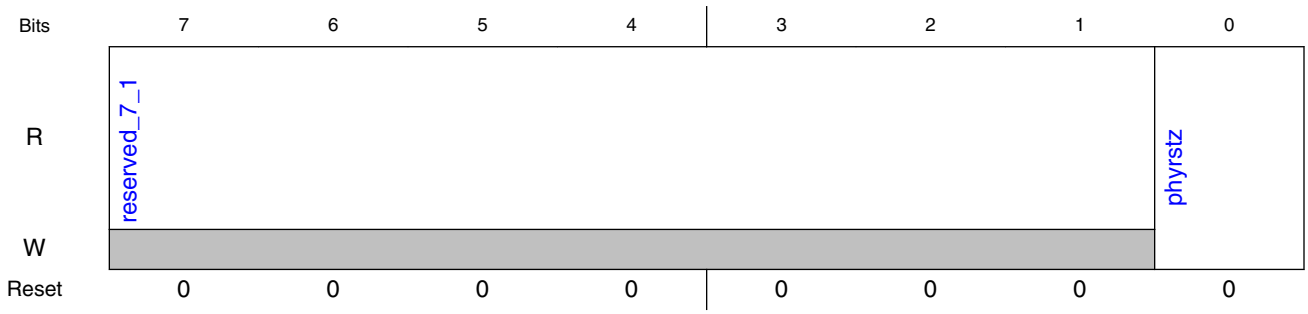
13.9.3.9.4 Main Controller Feed Through Control Register (mc_flowctrl)

13.9.3.9.4.1 Offset

Register	Offset
mc_flowctrl	4h

13.9.3.9.4.2 Diagram

13.9.3.9.4.3 Fields



Field	Function

mc_lockonclock_1	6h

13.9.3.9.6.2 Diagram

13.9.3.9.6.3 Fields

Field	Function
7 igpaclk	GPAUD interface clock status. GPAUD interface clock status. This bit is enabled when the Generic Parallel Audio (GPAUD) interface is enabled (AUDIO_IF = 6). Otherwise, this bit returns zero. This bit indicates the clock is present in the system. It is cleared by writing 1 to this bit.
6 pclk	Pixel clock status. Pixel clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
5 tclk	TMDS clock status. TMDS clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
4 prepclk	Pixel Repetition clock status. Pixel Repetition clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
3 i2sclk	I2S clock status. I2S clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
2 audiospdifclk	SPDIF clock status. SPDIF clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
1 reserved_1	Reserved and read as zero
0 cecclk	CEC clock status. CEC clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.

13.9.3.10 ColorSpaceConverter register descriptions

13.9.3.10.1 Memory map

ColorSpaceConverter registers base address: 4100h

Offset	Register	Width (In bits)	Access	Reset value
0h	Color Space Converter Interpolation and Decimation Configuration Register (csc_cfg)	8	RW	00h
1h	Color Space Converter Scale and Deep Color Configuration Register (csc_scale)	8	RW	01h
2h	Color Space Converter Matrix A1 Coefficient Register MSB Notes: - The coefficients used in the CSC matrix use only 15 bits for the internal computations. (csc_coef_a1_msb)	8	RW	20h

Table continues on the next page...

Offset	Register	Width (In bits)	Access	Reset value
3h	Color Space Converter Matrix A1 Coefficient Register LSB Notes: - The coefficients used in the CSC matrix use only 15 bits for the internal computations. (csc_coef_a1_lsb)	8	RW	00h
4h	Color Space Converter Matrix A2 Coefficient Register MSB Color Space Conversion A2 coefficient. (csc_coef_a2_msb)	8	RW	00h
5h	Color Space Converter Matrix A2 Coefficient Register LSB Color Space Conversion A2 coefficient. (csc_coef_a2_lsb)	8	RW	00h
6h	Color Space Converter Matrix A3 Coefficient Register MSB Color Space Conversion A3 coefficient. (csc_coef_a3_msb)	8	RW	00h
7h	Color Space Converter Matrix A3 Coefficient Register LSB Color Space Conversion A3 coefficient. (csc_coef_a3_lsb)	8	RW	00h
8h	Color Space Converter Matrix A4 Coefficient Register MSB Color Space Conversion A4 coefficient. (csc_coef_a4_msb)	8	RW	00h
9h	Color Space Converter Matrix A4 Coefficient Register LSB Color Space Conversion A4 coefficient. (csc_coef_a4_lsb)	8	RW	00h
Ah	Color Space Converter Matrix B1 Coefficient Register MSB Color Space Conversion B1 coefficient. (csc_coef_b1_msb)	8	RW	00h
Bh	Color Space Converter Matrix B1 Coefficient Register LSB Color Space Conversion B1 coefficient. (csc_coef_b1_lsb)	8	RW	00h
Ch	Color Space Converter Matrix B2 Coefficient Register MSB Color Space Conversion B2 coefficient. (csc_coef_b2_msb)	8	RW	20h
Dh	Color Space Converter Matrix B2 Coefficient Register LSB Color Space Conversion B2 coefficient. (csc_coef_b2_lsb)	8	RW	00h
Eh	Color Space Converter Matrix B3 Coefficient Register MSB Color Space Conversion B3 coefficient. (csc_coef_b3_msb)	8	RW	00h
Fh	Color Space Converter Matrix B3 Coefficient Register LSB Color Space Conversion B3 coefficient. (csc_coef_b3_lsb)	8	RW	00h
10h	Color Space Converter Matrix B4 Coefficient Register MSB Color Space Conversion B4 coefficient. (csc_coef_b4_msb)	8	RW	00h
11h	Color Space Converter Matrix B4 Coefficient Register LSB Color Space Conversion B4 coefficient. (csc_coef_b4_lsb)	8	RW	00h
12h	Color Space Converter Matrix C1 Coefficient Register MSB Color Space Conversion C1 coefficient. (csc_coef_c1_msb)	8	RW	00h
13h	Color Space Converter Matrix C1 Coefficient Register LSB Color Space Conversion C1 coefficient. (csc_coef_c1_lsb)	8	RW	00h
14h	Color Space Converter Matrix C2 Coefficient Register MSB Color Space Conversion C2 coefficient. (csc_coef_c2_msb)	8	RW	00h
15h	Color Space Converter Matrix C2 Coefficient Register LSB Color Space Conversion C2 coefficient. (csc_coef_c2_lsb)	8	RW	00h
16h	Color Space Converter Matrix C3 Coefficient Register MSB Color Space Conversion C3 coefficient. (csc_coef_c3_msb)	8	RW	20h
17h	Color Space Converter Matrix C3 Coefficient Register LSB Color Space Conversion C3 coefficient. (csc_coef_c3_lsb)	8	RW	00h
18h	Color Space Converter Matrix C4 Coefficient Register MSB Color Space Conversion C4 coefficient. (csc_coef_c4_msb)	8	RW	00h
19h	Color Space Converter Matrix C4 Coefficient Register LSB Color Space Conversion C4 coefficient. (csc_coef_c4_lsb)	8	RW	00h

Table continues on the next page...

Offset	Register	Width (In bits)	Access	Reset value
1Ah	Color Space Converter Matrix Output Up Limit Register MSB (csc_limit_up_msb)	8	RW	FFh
1Bh	Color Space Converter Matrix output Up Limit Register LSB (csc_limit_up_lsb)	8	RW	FFh
1Ch	Color Space Converter Matrix output Down Limit Register MSB (csc_limit_dn_msb)	8	RW	00h
1Dh	Color Space Converter Matrix output Down Limit Register LSB (csc_limit_dn_lsb)	8	RW	00h

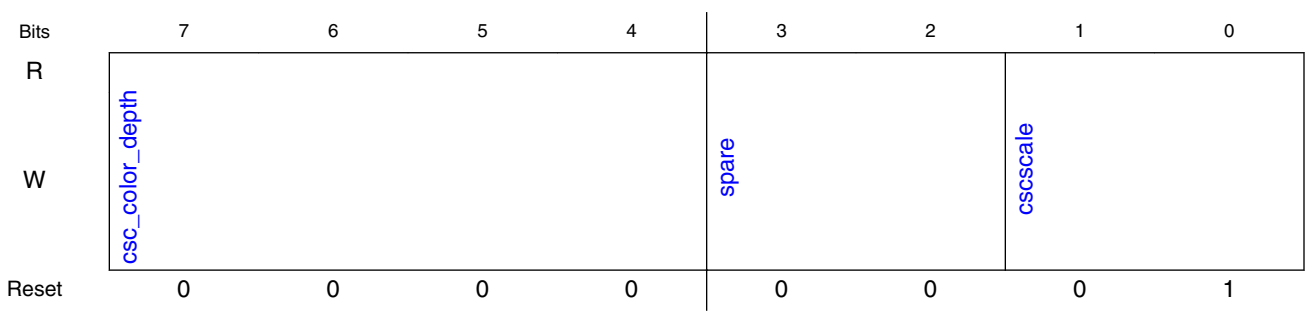
13.9.3.10.2.3 Fields

Field	Function
7 csc_limit	When set (1'b1), the range limitation values defined in registers csc_mat_uplim and csc_mat_dnlim are applied to the output of the Color Space Conversion matrix. When set (1'b1), the range limitation values defined in registers csc_mat_uplim and csc_mat_dnlim are applied to the output of the Color Space Conversion matrix. This feature ensures that the video output range is always respected, independently of the matrix coefficient configuration or of the video input stream.
6 spare_2	Reserved as "spare" register with no associated functionality.

Table continues on the next page...



Field	Function
5-4 intmode	Chroma interpolation configuration: intmode[1:0] I Chroma Interpolation 00 I interpolation disabled 01 I Hu (z) =1 + z^(-1) 10 I Hu(z)=1/ 2 + z^(-11)+1/2 z^(-2) 11 I interpolation disabled
3-2 spare_1	Reserved as "spare" register with no associated functionality.
1-0 decmode	Chroma decimation configuration: decmode[1:0] I Chroma Decimation 00 I decimation disabled 01 I Hd (z) =1 10 I Hd(z)=1/ 4 + 1/2z^(-1)+1/4 z^(-2) 11 I Hd(z)x2^(11)= -5+12z^(-2) - 22z^(-4)+39z^(-8) +109z^(-10) -204z^(-12)+648z^(-14) + 1024z^(-15) +648z^(-16) -204z^(-18) +109z^(-20)- 65z^(-22) +39z^(-24) -22z^(-26) +12z^(-28)-5z^(-30)

13.9.3.10.3 Color Space Converter Scale and Deep Color Configuration Register (csc_scale)

13.9.3.10.3.3 Fields

Field	Function
7-4 csc_color_depth	Color space converter color depth configuration: csc_colordepth[3:0] I Action 0000 I 24 bit per pixel video (8 bit per component). Color space converter color depth configuration: csc_colordepth[3:0] I Action 0000 I 24 bit per pixel video (8 bit per component). 0001-0011 I Reserved. Not used. 0100 I 24 bit per pixel video (8 bit per component).

Table continues on the next page...

Field	Function
	0101 | 30 bit per pixel video (10 bit per component). 0110 | 36 bit per pixel video (12 bit per component). 0111 | 48 bit per pixel video (16 bit per component). other | Reserved. Not used.
3-2 spare	The is a Reserved as "spare" register with no associated functionality.
1-0 cscscale	Defines the cscscale[1:0] scale factor to apply to all coefficients in Color Space Conversion. Defines the cscscale[1:0] scale factor to apply to all coefficients in Color Space Conversion. This scale factor is expressed in the number of left shifts to apply to each of the coefficients, ranging from 0 to 2.

13.9.3.10.4 Color Space Converter Matrix A1 Coefficient Register MSB Notes: - The coefficients used in the CSC matrix use only 15 bits for the internal computations. (csc_coef_a1_msb)

13.9.3.10.4.1 Offset

Register	Offset
csc_coef_a1_msb	2h

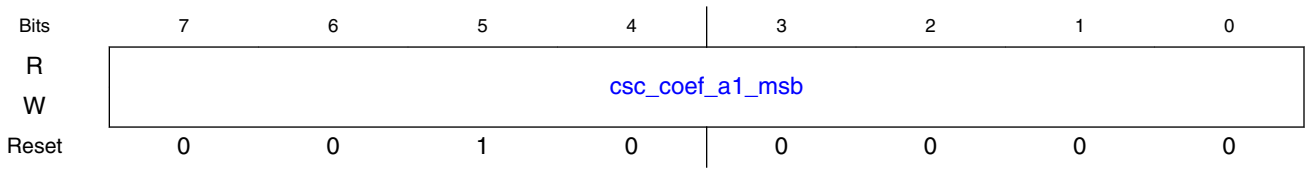
13.9.3.10.4.2 Function

Color Space Converter Matrix A1 Coefficient Register MSB

Notes:

- The coefficients used in the CSC matrix use only 15 bits for the internal computations.

- Coefficients are represented in 2's complementary format and stored in two registers:



- csc_coef_*_lsb[7:0]: coefficient bits 7 to 0

- csc_coef_*_msb[7]: spare bit

- csc_coef_*_msb[6:0]: coefficient bits 14 to 8

- Examples for standard ITU601 and ITU709 RGB/YCbCr conversion CSC coefficients exist in the Video Datapath Application Note (available from the Synopsys web site).

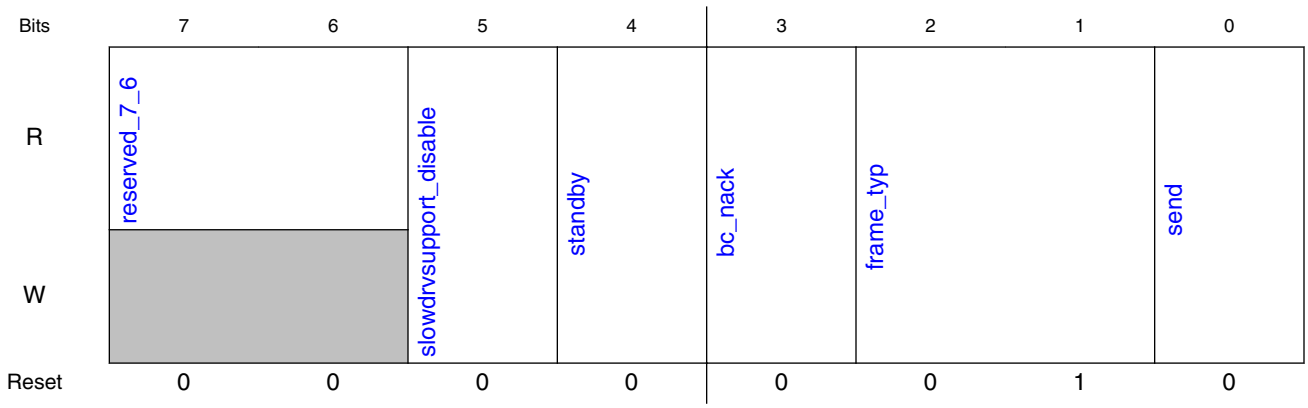
13.9.3.11 CEC register descriptions

13.9.3.11.1 Memory map

CEC registers base address: 7D00h



Offset	Register	Width (In bits)	Access	Reset value
0h	CEC Control Register This register handles the main control of the CEC initiator. (cec_ctrl)	8	RW	02h
2h	CEC Interrupt Mask Register This read/write register masks/unmasks the interrupt events. (cec_mask)	8	RW	00h
5h	CEC Logical Address Register Low This register indicates the logical address(es) allocated to the CEC device. (cec_addr_l)	8	RW	00h
6h	CEC Logical Address Register High This register indicates the logical address(es) allocated to the CEC device. (cec_addr_h)	8	RW	80h
7h	CEC TX Frame Size Register This register indicates the size of the frame in bytes (including header and data blocks), which are available in the transmitter data buffer. (cec_tx_cnt)	8	RW	00h
8h	CEC RX Frame Size Register This register indicates the size of the frame in bytes (including header and data blocks), which are available in the receiver data buffer. (cec_rx_cnt)	8	RO	00h
30h	CEC Buffer Lock Register (cec_lock)	8	RW	00h
31h	CEC Wake-up Control Register After receiving a message in the CEC_RX_DATA1 (OPCODE) registers, the CEC engine verifies the message opcode[7:0] against one of the previously defined values to generate the wake-up status: Wakeupstatus is 1 when: received opcode is 0x04 and opcode0x04en is 1 or received opcode is 0x0D and opcode0x0Den is 1 or received opcode is 0x41 and opcode0x41en is 1 or received opcode is 0x42 and opcode0x42en is 1 or received opcode is 0x44 and opcode0x44en is 1 or received opcode is 0x70 and opcode0x70en is 1 or received opcode is 0x82 and opcode0x82en is 1 or received opcode is 0x86 and opcode0x86en is 1 Wakeupstatus is 0 when none of the previous conditions are true. (cec_wakeupctrl)	8	RW	FFh

13.9.3.11.2 CEC Control Register This register handles the main control of the CEC initiator. (cec_ctrl)

13.9.3.11.2.1 Offset

Register	Offset
cec_ctrl	0h

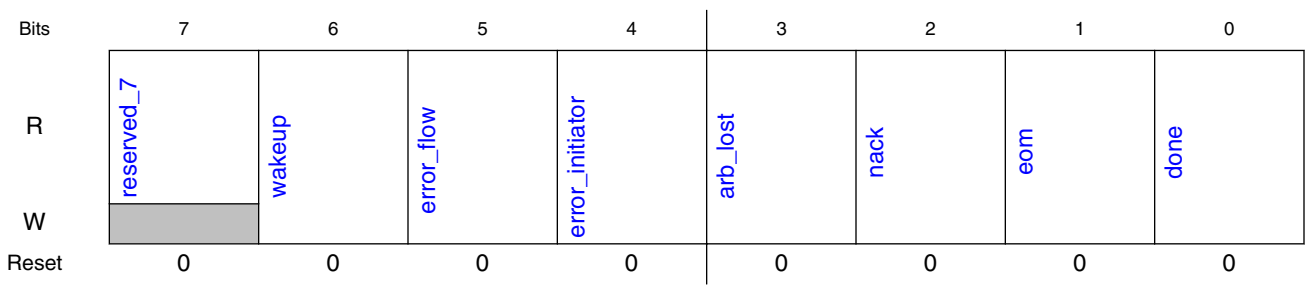
13.9.3.11.2.2 Diagram

13.9.3.11.2.3 Fields

Field	Function
7-6 reserved_7_6	Reserved and read as zero
5 slowdrvsupport_disable	- 1: CEC controller supports IO drivers with risetime of up to 1 CEC clock period. - 1: CEC controller supports IO drivers with risetime of up to 1 CEC clock period. - 0: CEC controller supports IO drivers with risetime greater than 1 CEC clock period and where the IO driver risetime-falltime < 170us .
4 standby	- 1: CEC controller responds with a NACK to all messages and generates a wakeup status for opcode. - 1: CEC controller responds with a NACK to all messages and generates a wakeup status for opcode. It only responds with a NACK when the EOM is received. This means only the last block of a frame responds with NACK. The follower sends an ACK to the message when there is only one head block pointed to the follower, if the follower is in the standby mode. - 0: CEC controller responds the ACK to all messages.
3 bc_nack	- 1'b1: Set by software to NACK the received broadcast message. - 1'b1: Set by software to NACK the received broadcast message. This bit holds until software resets. The broadcasts is answered with 1'b0, indicating the follower reject the message. - 1'b0: Reset by software to ACK the received broadcast message.
2-1 frame_typ	- 2'b00: Signal Free Time = 3-bit periods. - 2'b00: Signal Free Time = 3-bit periods. Previous attempt to send frame is unsuccessful. - 2'b01: Signal Free Time = 5-bit periods. New initiator wants to send a frame. - 2'b10: Signal Free Time = 7-bit periods. Present initiator wants to send another frame immediately after its previous frame. (specification CEC 9.1). - 2'b11: Illegal value. If software writes this value, hardware sets the value to the default 2'b01.
0 send	- 1'b1: Set by software to trigger CEC sending a frame as an initiator. - 1'b1: Set by software to trigger CEC sending a frame as an initiator. This bit keeps at 1'b1 while the transmission is going on. - 1'b0: Reset to 1'b0 by hardware when the CEC transmission is done (no matter successful or failed). It can also work as an indicator checked by software to see whether the transmission is finished.

13.9.3.11.3 CEC Interrupt Mask Register This read/write register masks/unmasks the interrupt events. (cec_mask)

13.9.3.11.3.1 Offset



Register	Offset
cec_mask	2h

13.9.3.11.3.2 Function

CEC Interrupt Mask Register

This read/write register masks/unmasks the interrupt events. When the bit is set to 1 (masked), the corresponding event does not trigger an interrupt signal at the system interface. When the bit is reset to 0, the interrupt event is unmasked.

13.9.3.11.3.3 Diagram

13.9.3.11.3.4 Fields

Field	Function
7 reserved_7	Reserved and read as zero
6 wakeup	Follower wake-up signal mask
5 error_flow	An error is notified by a follower. An error is notified by a follower. Abnormal logic data bit error (for follower)
4 error_initiator	An error is detected on a CEC line (for initiator only).
3	The initiator losses the CEC line arbitration to a second initiator.

Table continues on the next page...

Field	Function
arb_lost	The initiator losses the CEC line arbitration to a second initiator. (specification CEC 9)
2 nack	A frame is not acknowledged in a directly addressed message. A frame is not acknowledged in a directly addressed message. Or a frame is negatively acknowledged in a broadcast message (for initiator only)
1 eom	EOM is detected so that the received data is ready in the receiver data buffer (for follower only)
0 done	The current transmission is successful (for initiator only)

13.9.3.11.4 CEC Logical Address Register Low This register indicates the logical address(es) allocated to the CEC device. (cec_addr_l)

13.9.3.11.4.1 Offset

Register	Offset
cec_addr_l	5h

13.9.3.11.4.2 Function

CEC Logical Address Register Low

This register indicates the logical address(es) allocated to the CEC device.

This register is written by software when the logical allocation is finished. Bit value 1 means the corresponding logical address is allocated to this device. Bit value 0 means the corresponding logical address is not allocated to this device.

13.9.3.11.4.3 Diagram

13.9.3.11.8 CEC Buffer Lock Register (cec_lock)

13.9.3.11.8.1 Offset

Register	Offset
cec_lock	30h

13.9.3.11.8.2 Diagram

13.9.3.11.8.3 Fields

Field	Function
7-1 reserved_7_1	Reserved and read as zero
0 locked_buffer	When a frame is received, this bit would be active. When a frame is received, this bit would be active. The CEC controller answers to all the messages with NACK until the CPU writes it to '0'.

13.9.3.11.9 CEC Wake-up Control Register After receiving a message in the CEC_RX_DATA1 (OPCODE) registers, the CEC engine verifies the message opcode[7:0] against one of the previously defined values to generate the wake-up status: Wakeupstatus is 1 when: received opcode is 0x04 and opcode0x04en is 1 or received opcode is 0x0D and opcode0x0Den is 1 or received opcode is 0x41 and opcode0x41en is 1 or received opcode is 0x42 and opcode0x42en is 1 or received opcode is 0x44 and opcode0x44en is 1 or received opcode is 0x70 and opcode0x70en is 1 or received opcode is 0x82 and opcode0x82en is 1 or received opcode is 0x86 and

opcode0x86en is 1 Wakeupstatus is 0 when none of the previous conditions are true. (cec_wakeupctrl)

13.9.3.11.9.1 Offset

Register	Offset
cec_wakeupctrl	31h

13.9.3.11.9.2 Function

CEC Wake-up Control Register

After receiving a message in the CEC_RX_DATA1 (OPCODE) registers, the CEC engine verifies the message opcode[7:0] against one of the previously defined values to generate the wake-up status:

Wakeupstatus is 1 when:

received opcode is 0x04 and opcode0x04en is 1 or

received opcode is 0x0D and opcode0x0Den is 1 or

received opcode is 0x41 and opcode0x41en is 1 or

received opcode is 0x42 and opcode0x42en is 1 or

received opcode is 0x44 and opcode0x44en is 1 or

received opcode is 0x70 and opcode0x70en is 1 or

received opcode is 0x82 and opcode0x82en is 1 or

received opcode is 0x86 and opcode0x86en is 1

Wakeupstatus is 0 when none of the previous conditions are true.

This formula means that the wake-up status (on CEC_STAT[6] register) is only '1' if the opcode[7:0] received is equal to one of the defined values and the corresponding enable bit of that defined value is set to '1'.

13.9.3.11.9.3 Diagram

13.10 HDMI TX PHY

13.10.1 Overview

The HDMI (High Definition Multimedia Interface) TX PHY is compatible with the HDMI v1.4/v2.0 spec and supports 4Kp30 video resolution. It accepts Transition-Minimized Differential Signaling (TMDS) coded parallel data from the HDMI link layer and transmits them into HDMI cable with a serialized form.

13.10.1.1 Block Diagram

The high level block diagram for the HDMI TX PHY is shown below.

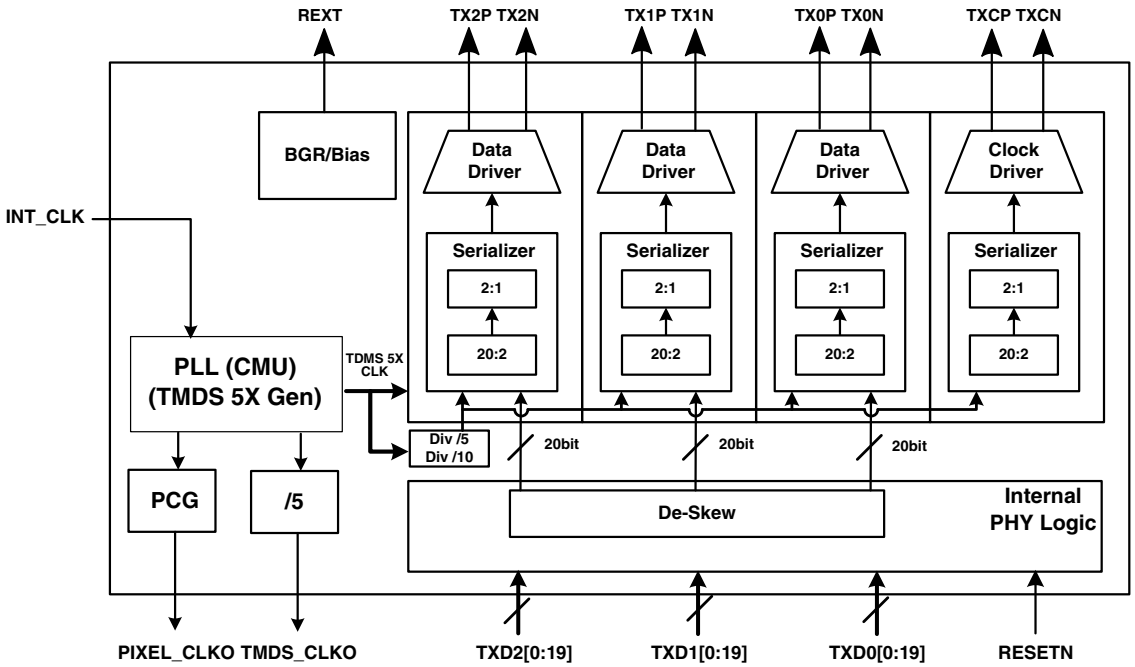

Figure 13-78. HDMI TX PHY Block Diagram

The PHY receives parallel data from the LINK. The data is serialized and transmitted on the TXnP/N differential outputs, which are driven from the TX open-drain type driver. The TX driver characteristics, such as amplitude and pre-emphasis are user-controlled. BIAS block can generate bias currents that are used for each lane using the band-gap reference and an external resistor through the REXT pad. The PLL generates high-speed clock, which is needed for TX serializer.

13.10.1.2 Features

HDMI TX PHY supports the following features:

- Supports TMDS clock
- 20-bit parallel data interface for transmit up to 297 MHz
- Supports integrated pixel clock generator
- Video formats up to 4Kp30

13.10.2 Functional Description

13.10.2.1 Common Block

The Common block consists of a Band-gap Reference(BGR), Bias generator, and Phase Locked Loop (PLL). Additonal details on each block is provided in the following sections.

13.10.2.1.1 Band-gap Reference (BGR) and Bias Generator

The BGR circuit generates high-accuracy reference voltage across Process, Voltage and Temperature (PVT) variation. A bias generator makes two kinds of current, external- and internal-resistor (RMRES)-referred current, and these currents are distributed to each block in Common and Lanes. The external resistor-referred (REXT) current is generated using aresistor which is connected between the REXT pad and ground outside the chip. On the other hand, the internal resistor-referred current is generated using internally integrated replica resistor to compensate resistance error across PVT variation.

13.10.2.1.2 Phase Locked Loop (PLL)

The PLL in the Common synthesizes high-speed clock, which is used for TX serializer from the reference clock. The nominal reference frequency is 24MHz.

In the HDMI TX PHY, the high frequency clock from the PLL is used in the serialization of TX data. The following are the main features of the PLL:

- Supports ring VCO
- Fractional PLL with sigma delta modulated divider.
- Automatic frequency calibrated (AFC) oscillator setting for the desired frequency of operation
- Programmable divider value control for pre-divider (P), main divider (M), and post divider (S)
- Programmable charge pump current and loop filter resistance allowing for wide range of programmable loop bandwidth and peaking
-

The output frequency of PLL in integer mode is derived with the following formula:

$$F_{PLL} = F_{REF} \times M/(P \times S)$$

P, M and S are pre-, main- and post-divider values, respectively.

The output frequency of PLL in fractional mode is derived with the following fomula:

$$TCLK5X = F_{ref} \times 1/P \times (M + K/LC \times 1/PI \times ((SDC \times P)/24)) \times 1/S$$

SDC is derived with the following fomula:

$$SDC = F_{ref} \times (M/P) / (N \times (LC_{sub} - K_{sub})/(LC_{sub}) + (N - 1) \times K_{sub})/LC_{sub})$$

K and LC are nominator and denominator of the fractional part, PI is the number of phase of the phase interpolator, N is the dividing-ratio for the Sigma-Delta Modulation (SDM) clock, respectively. The PLL clock is distributed to each lane by a clock distribution (CD) buffers.

13.10.2.2 Lane

Each Lane block consists of serializer and driver.

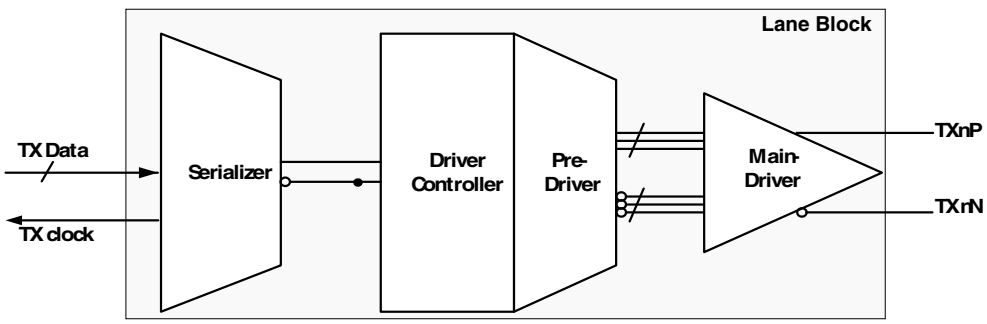

Figure 13-79. Lane Block Diagram

13.10.2.3 Serializer

The serializer accepts 20-bit data (TXD[0:19]) from the PHY digital via 20-bit bus which is synchronized to TX byte clock. The parallel data is converted to the high-speed serial data.

NOTE

The LSB in the input parallel data is transmitted first and the MSB the last. This data will be serialized and transmitted on the TXnP/N differential outputs according to specified resolutions.

13.10.2.4 Driver

The driver generates baud-rate voltage waveform on TX output pads, TXnP/N. The driver comprises of driver controller, pre-driver and main-driver. The output data of serializer are delivered to the main-driver via the predriver and the driver controller. The main driver is based on open-drain type driver. The amplitude of output signaling can be controlled by TX_CH_AMP_LVL.

TX driver has 2-Tap de-emphasis function to compensate channel loss. TX equalization is controlled primarily through the TX_EMP_LVL bit bit. These pins control internal registers values.

13.10.2.5 Deserializer

In the BIST (Built-In Self-Test) mode, the serial data from the serializer is fed back to the deserializer. Deserializer converted serial data to 20-bit parallel data and transferred them into PHY digital circuit to check bit error. The main purpose of deserializer is to verify the functionality of the serializer.

13.10.3 Memory Map and register definition

This section includes the HDMI_TX PHY module memory map and descriptions of the registers.

13.10.3.1 HDMI_TX_PHY register descriptions

Field	Description
7-5 FAST_LOCK_SETTLE_NO	FAST_LOCK settlement number setting FAST_LOCK settlement number setting. Define LOCK continuous conditions for FAST_LOCK to be high.
4-0	PLL locking ppm range setting

Field	Description
AFC_LOCK_PPM_SET	PLL locking ppm range setting. PLL_LOCK signal is combination logic of two kinds of lock signals: FAST_LOCK and SLOW_LOCK, respectively. PLL_LOCK becomes high under the following conditions: - FAST_LOCK = 1 or SLOW_LOCK = 1 when FAST/SLOW_LOCK_BYPASS =0 (default setting) - FAST_LOCK = 1 when FAST_LOCK_BYPASS =1 - SLOW _LOCK = 1 when SLOW_LOCK_BYPASS =1 Otherwise, PLL_LOCK is 0. The FAST_LOCK becomes high when the following 2 conditions are met. Condition1: If the difference between the VCO clock and the reference clock counter value is within PLL_LOCK_PPM_SET value for a certain period of time. This period is selected by shifting PLL PMS_M [7: 0] to the right until it becomes bigger than 1024. When PMS_M [7: 0] is h5c, if shift it 4 to the right or multiply it by 16. It will be h5c0 (1280). It means that the VCO clock counter must be 1280 during 16 reference clock period if PLL is locked. Condition2: If the number of consecutive lock of the previous condition1 is maintained above the setting number in FAST_LOCK_SETTLE_NO[2:0] (APB24, bit7-5) The slow lock becomes high if the difference between the counter value of PLL clock after M main divider during 1024 reference clock and the expected value 1024 is within the PLL_LOCK_PPM_SET error range.

13.11 HDMI TX BLK_CTRL

13.11.1 Overview

The HDMIMIX domain contains control and status registers known as HDMI TX Block Control (HDMI TX BLK_CTRL). These registers have miscellaneous top-level controls for the HDMI peripherals within the HDMIMIX domain. Some of these controls includes

clocking, interrupt, and reset sources. Please see the clock control chapter and interrupt chapter for more information regarding the clock input sources and IRQ event mapping to HDMIMIX.

13.11.1.1 Block Diagram

The HDMI BLK_CTRL interface connects to the HDMIMIX domain peripherals. A block diagram illustrating the HDMIMIX domain is shown below.

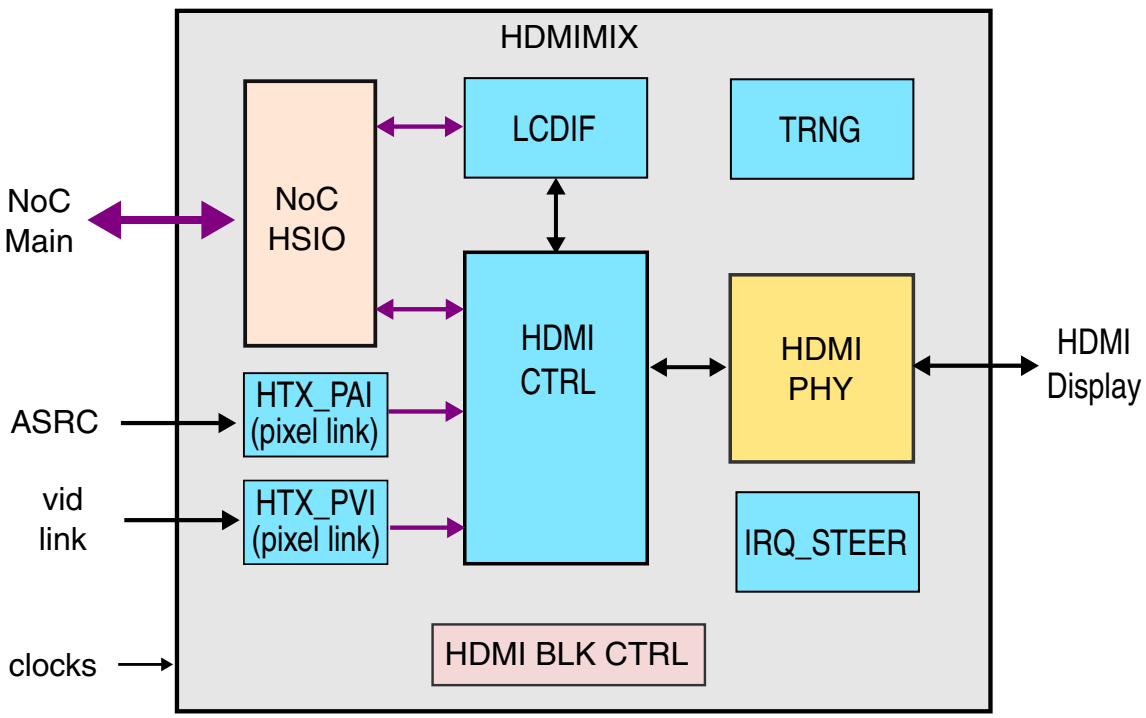

Figure 13-80. HDMIMIX Block Diagram

13.11.2 Clocks and Resets

The HDMI BLK_CTRL contains clock distribution and gating controls, as well as reset handling to several of the HDMIMIX peripherals. The clock gating controls include several layers of gating, which include Fail/Safe control. Please see related clock and reset controls in the BLK_CTRL register description. For more information about the input clocks, system-level resets, and IRQ to the domain, please see the related block guide and system-level assignments in the control blocks for clocks, reset, and IRQ assignments.

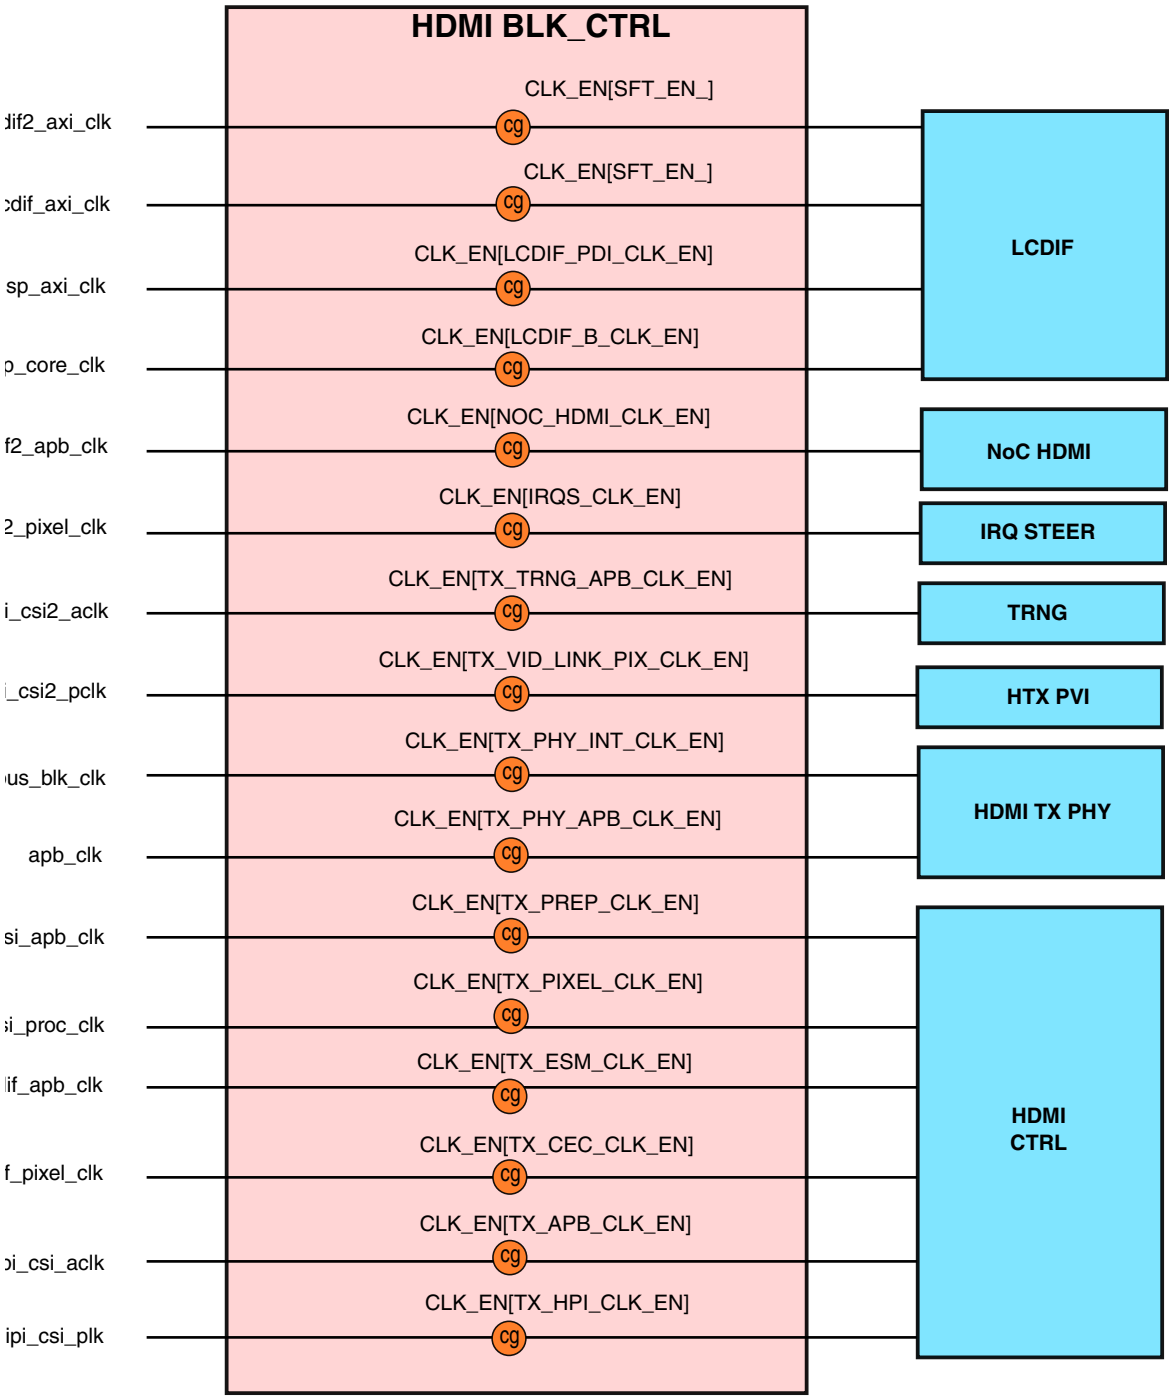

Figure 13-81. HDMI BLK_CTRL Clocks

3-1 —	Reserved
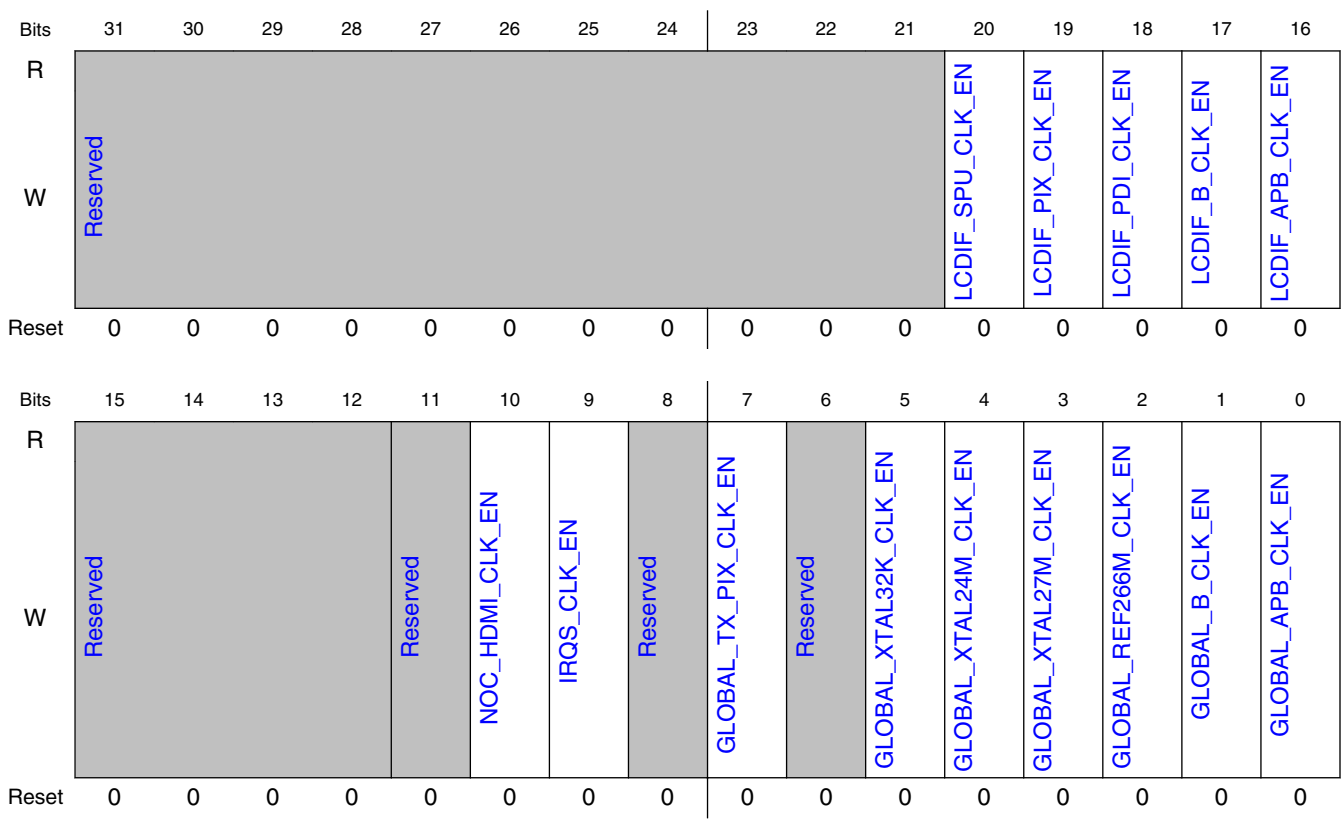
0 NOC_RESET_N	NOC_RESET_N control Active low Soft reset to the reset_n input of NOC This same reset is synchronized to the respective clock domain and fed to NOC

13.11.3.1.5 HDMI_RTX_CLK_CTL0 (RTX_CLK_CTL0)



13.11.3.1.5.1 Offset

Register	Offset	Description
RTX_CLK_CTL0	40h	HDMI_RTX_CLK_CTL0
RTX_CLK_CTL0_SET	44h	Writing a 1 to a bit in this register sets the corresponding bit in RTX_CLK_CTL0
RTX_CLK_CTL0_CLR	48h	Writing a 1 to a bit in this register clears the corresponding bit in RTX_CLK_CTL0
RTX_CLK_CTL0_TOG	4Ch	Writing a 1 to a bit in this register toggles the corresponding bit in RTX_CLK_CTL0

13.11.3.1.5.2 Function

Fuse takes the highest priority in clock control; if a function is disabled through fuse all related clocks are gated (disabled) Second priority is given to always-on/always-off condition (registers related to this are mentioned below) Third priority is given to Level1 clock enable - global clock controls Fourth priority is given to Level2 clock enable which is programmed in BLK_CTL in registers mentioned below Fifth priority is given to Level3 clock enable provided by the corresponding blocks for their idle condition

13.12 HDMI TX Parallel Audio Interface (HTX_PAI)

13.12.1 Overview

The HDMI TX Parallel Audio Interface (HTX_PAI) is a digital module that acts as the bridge between the Audio Subsystem to the HDMI TX Controller.

13.12.1.1 Block Diagram

The HTX_PAI block diagram is represented by the following figure:

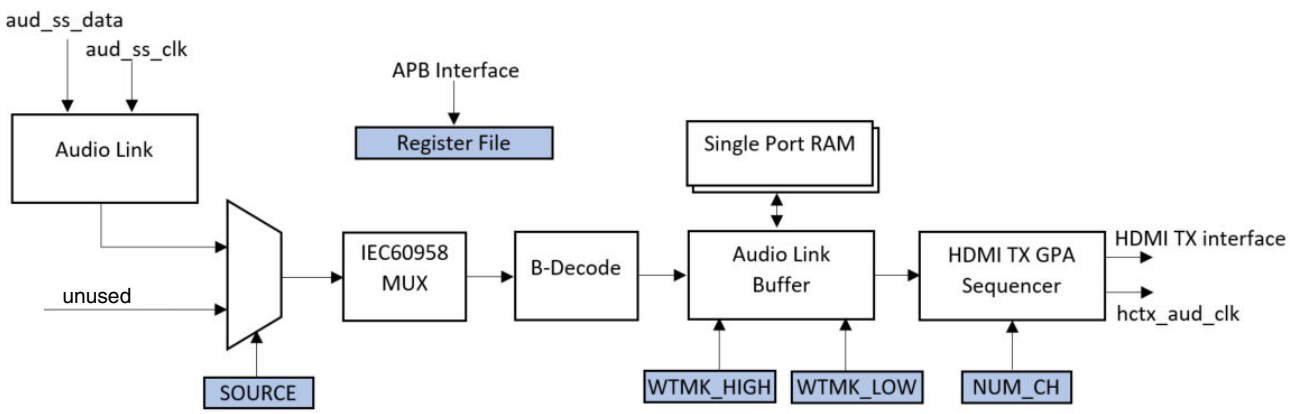

Figure 13-82. HTX_PAI Block Diagram

13.12.1.2 Features

The HTX_PAI has the following features:

- IEC60958 component muxing
- B-Preamble decoding
- Intermediate storage to queue results prior to being passed to the HDMI TX GPA Interface

13.12.2 Functional Description

The source of audio data is selected through the HTX_PAI_CTRL_EXT[SOURCE] register field.

If SOURCE = 0x0, audio samples are received from the Audio Subsystem using a source synchronous interface which is contained within Audio Link module. Note, data received by the Audio Link will be 32-bits wide and must contain the standard IEC60958 P,C,U,V,Data, and Preamble fields. However, data received from the audio subsystem can have an arbitrary component ordering. The HTX_PAI block has integrated muxing options to select which sections of the 32-bit input data word will be mapped to each IEC60958 field. The HTX_PAI_FIELD_CTRL register contains mux selects to individually select P,C,U,V,Data, and Preamble. An illustration of the IEC60958 mux select hardware is represented in the following diagram.

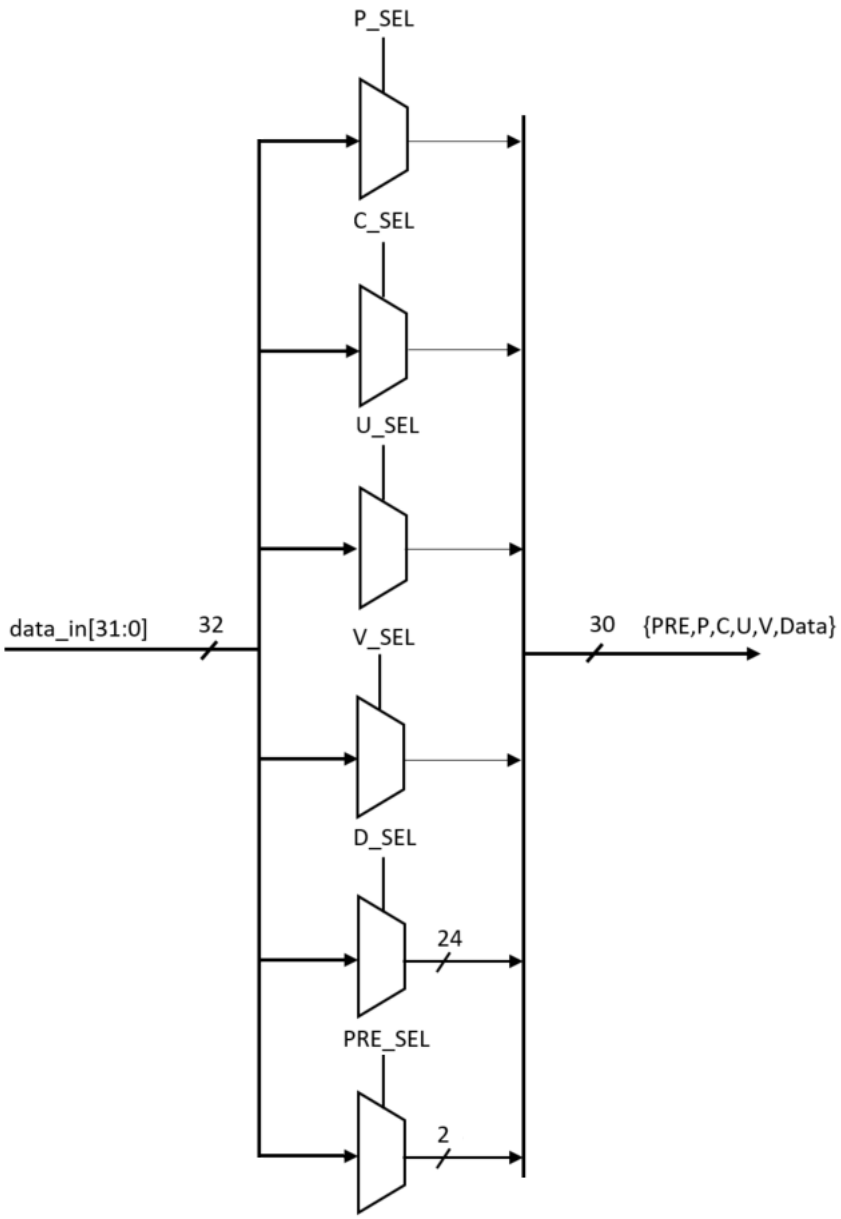

Figure 13-83. HTX_PAI IEC60958 Muxing

NOTE

The muxing procedure decodes the IEC60958 4-bit preamble into a synthetic 2-bit preamble to be used for the HTX_PAI and downstream logic. The final muxed output will be a 30-bit field organized in {PRE[1:0],P,C,U,V,Data[23:0]} order. After component muxing, data is decoded and placed into the Audio Link Buffer. The buffer contains storage for up to 256 samples.

There is a programmable watermark to detect when the Audio Link Buffer fills above or below a specific threshold. This will provide status information which can be used for audio data flow control. Maskable interrupt flags will be generated for underflow, overflow, and watermark based events in the audio link buffer. Back pressure will be provided to the audio subsystem if the Audio Link Buffer WTMK_HIGH is crossed.

NOTE

This watermark should always be programmed with a minimum 8 entry headroom in the buffer (WTMK_HIGH < 248) to allow backpressure to properly function.

WTMK_LOW can be adjusted as per the system requirements to get an IRQ at the desired levels.

NOTE

The HTX_PAI_CTRL_EXT register must be completely configured prior to running the HTX_PAI block. The HTX_PAI module is enabled by setting the HTX_PAI_CTRL[ENABLE] bit to 0x1.

13.12.2.1 HDMI TX GPA Sequencer

The HDMI TX GPA interface uses a simple handshake based protocol to retrieve data from the Audio Link Buffer. The following waveform represents the TX GPA protocol for the case of two channel LPCM audio:

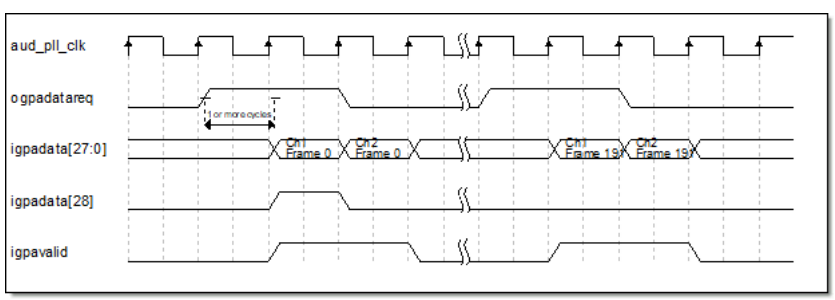

Figure 13-84. 2 Channel LPCM GPA Transaction

The HDMI TX Controller's GPA interface has a 29 bit audio packet, where the B-preamble bit is igpdata[28].Control logic will decode the B,Z – preamble, and set igpdata[28] high when detected.

Note, igpavalid must remain high throughout the duration of each data transfer. This means that 1 sample per channel must be queued in the Audio Link Buffer prior to accepting a new transaction. If the HDMI TX GPA module requests a transfer before the Audio Link Buffer contains enough samples to fulfill the request, then an underflow interrupt request will be triggered in the HTX_PAI_IRQ*[UND] register. The number of channels enabled is programmable using the HTX_PAI_CTRL_CXT[NUM_CH] register field. The HDMI TX GPA Sequencer will ensure that the Audio Link Buffer contains NUM_CH+1 samples prior to transmitting data to the HDMI TX GPA module.

Overflow happens when the FIFO is full and there is a request to write into the FIFO by the audio source. Corresponding IRQ will be triggered.

13.12.3 Memory Map and Register Definition

The memory map and detailed descriptions of all its registers are as follows.

13.12.3.1 HTX_PAI register descriptions

13.12.3.1.1 HTX_PAI_ADDR memory map

d_ip_htx_pai_syn base address: 32FC_4800h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
0	HTX PAI Control (HTX_PAI_CTRL)	32	RW	0000_0000
4	HTX PAI Control Extended (HTX_PAI_CTRL_EXT)	32	RW	0000_0000
8	HTX PAI Field Control (HTX_PAI_FIELD_CTRL)	32	RW	0000_0000

13.12.3.1.3.3 Fields

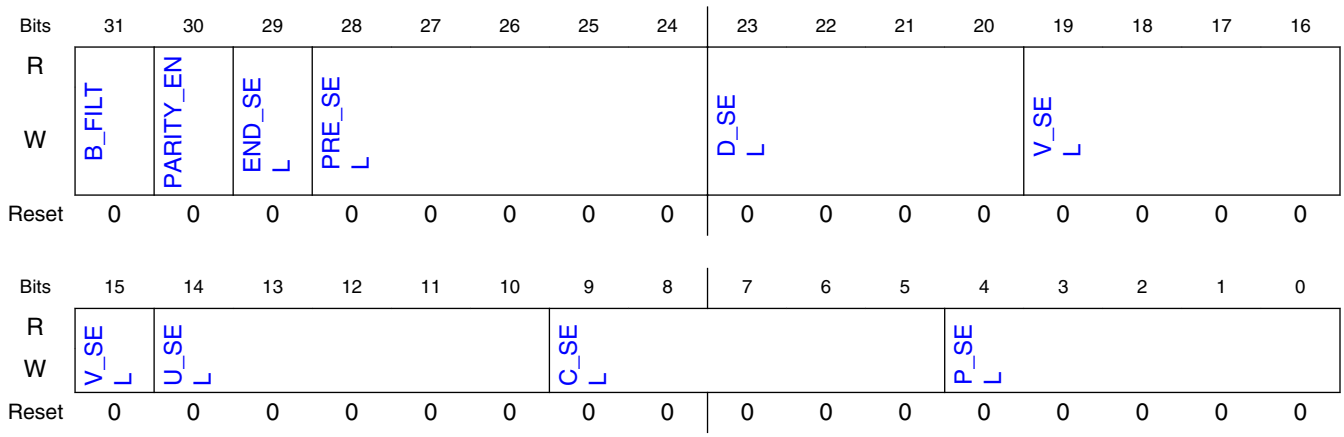
Field	Description
31-24 WTMK_HIGH	HTX PAI Watermark High The WTMK_HIGH level is used to detect if the number of entries in the link buffer is above a programmable threshold. If the number of entries is above WM_HIGH, a maskable interrupt flag will be generated, and the status bit WM_HIGH will be flaged in the HTX_PAI_STAT register. Note, WTMK_HIGH is also used for upstream flow control when operating in HTX_PAI_CTRL_CXT[SOURCE] = 0x0. In this mode, the maximum supported watermark level is WTMK_HIGH = 0xF7.
23-16 WTMK_LOW	HTX PAI Watermark Low The watermark low level is used to detect if the number of entries in the link buffer is below a programmable threshold. If the number of entries is below WTMK_LOW, a maskable interrupt flag will be generated, and the status bit WM_LOW will be flaged in the HTX_PAI_STAT register.
15-12 —	Reserved
11 B_EXT	B-Field Extension This bit is used to extend the B preamble. It will ensure that the B preamble is set for at least 2 consecutive samples. Note, if the B-preamble input to the HTX_PAI is already set for more than 1 cycle, B_EXT will have no impact. 0 - Use default B-Preamble timing (from selected input source). 1 - Extend B-Preamble timing to ensure it is set for at least 2 cycles.
10-8	Number of Channels Per Packet

Table continues on the next page...

Field	Description
NUM_CH	This register defines the number of audio channels required for 1 full HDMI TX audio packet delivery. For example, in a stereo audio use case there will be 2 channels per packet, so the NUM_CH regiser field will be set to 0x1. 000 - There is 1 channel per packet. 001 - There are 2 channels per packet. 010 - There are 3 channels per packet. 011 - There are 4 channels per packet. 100 - There are 5 channels per packet. 101 - There are 6 channels per packet. 110 - There are 7 channels per packet. 111 - There are 8 channels per packet.
7-1 —	Reserved
0 SOURCE	HTX PAI Source Select This bit selects the source for audio data input to the HTX_PAI. 0 - Normal operation. Data input from the audio subsystem. 1 - Reserved.

13.12.3.1.4 HTX PAI Field Control (HTX_PAI_FIELD_CTRL)

Audio frames must be stored in the Audio Link Buffer in the following format:



{PRE[1:0],P,C,U,V,Data[23:0]}

Writes to the HTX_PAI block are expected to contain all of the IEC60958 bit fields. However, the ordering of each field can be arbitrary in the input word. Bit field muxing is implemented in the HTX_PAI_FIELD_CTRL to provide a control mechanism to map any input word muxing to the output format required for the HDMI subsystem. MUX selects are implemented to select where each IEC60958 field is concatenated in the input word.

13.12.3.1.4.1 Offset

Register	Offset
HTX_PAI_FIELD_CTRL	8h

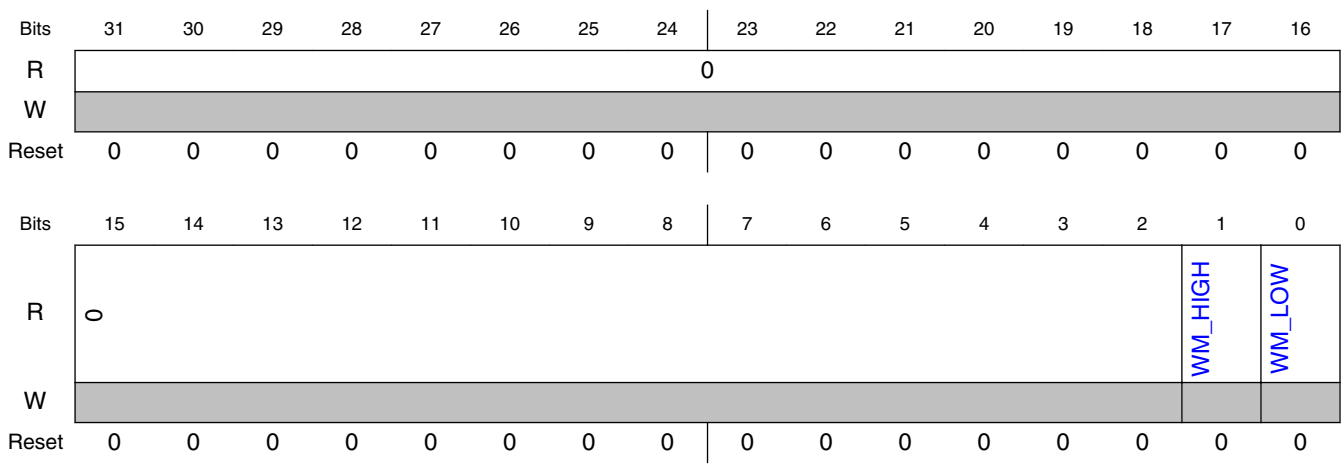
13.12.3.1.4.2 Diagram

13.12.3.1.4.3 Fields

Field	Description
31 B_FILT	B-Detect Filter This register field will enable the HTX_PAI to filter audio samples until the IEC60958 B preamble is detected. All samples written to the HTX_PAI will be dropped until the B preamble is detected if B_FILT = 1.
30 PARITY_EN	Parity Enable This bit is used to enable the HTX_PAI parity generator. If the input word already contains a pre-computed IEC60958 parity, then this bit can be set to 0. To ignore the input parity or generate the IEC60958 parity, set PARITY_EN to 1.
29 END_SEL	Endianness Select This bit is used to control the endianness of data input to the HTX_PAI. Set this bit to 0 if the input data is in little-endian format. Set this bit to 1 if the input data is in big-endian format.
28-24 PRE_SEL	IEC60958 Preamble Select This field is used to mux the Preamble field from the IEC60958 input data word. The P_SEL must be set equal to the bit position where the IEC60958 Preamble field is located (MSB-1). Note, the parity used by the HTX_PAI is compressed to two bits.
23-20 D_SEL	IEC60958 Data Select This field is used to select the position of the 24-bit data field input to the HTX_PAI. Note, the programing of this field will not be impacted by the endianness of the data. The D_SEL field should be programmed as the first bit position where valid data is located beginning from bit 0 and indexing up. The D_SEL determines the data position in the following way: data[23:0] = ((input_audio) >> D_SEL);
19-15 V_SEL	IEC60958 V Select This field is used to mux the Validity (V) field from the IEC60958 input data word. The V_SEL must be set equal to the bit position where the IEC60958 V field is located.
14-10 U_SEL	IEC60958 U Select This field is used to mux the User Data (U) field from the IEC60958 input data word. The U_SEL must be set equal to the bit position where the IEC60958 U field is located.

Table continues on the next page...

Field	Description
9-5 C_SEL	IEC60958 C Select This field is used to mux the Channel Status (C) field from the IEC60958 input data word. The C_SEL must be set equal to the bit position where the IEC60958 C field is located.
4-0 P_SEL	IEC60958 P Select This field is used to mux the Parity (P) field from the IEC60958 input data word. The P_SEL must be set equal to the bit position where the IEC60958 P field is located.



13.12.3.1.5 HTX PAI Status (HTX_PAI_STAT)

The HTX PAI Status Register reports the watermark status.

13.12.3.1.5.1 Offset

Register	Offset
HTX_PAI_STAT	Ch

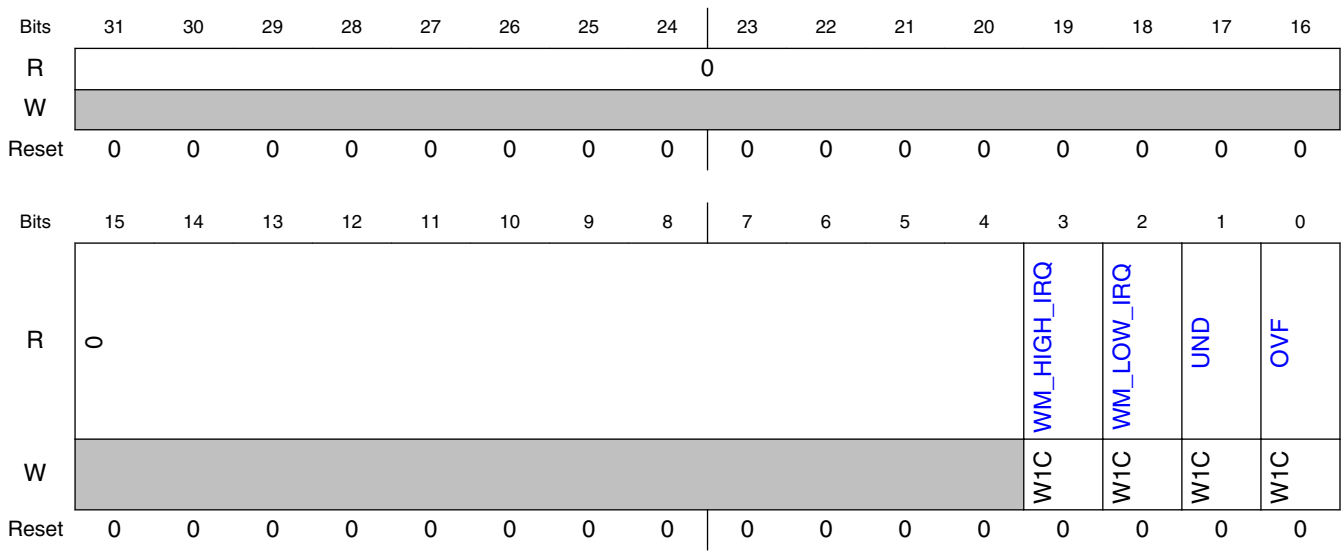
13.12.3.1.5.2 Diagram

13.12.3.1.5.3 Fields

Field	Description
31-2 —	Reserved
1 WM_HIGH	Watermark High Flag

Table continues on the next page...

Field	Description
	This flag will be set when the number of entries in the audio link buffer exceeds the WTMK_HIGH threshold.
0 WM_LOW	Watermark Low Flag This flag will be set when the number of entries in the audio link buffer is below the WTMK_LOW threshold.



13.12.3.1.6 HTX PAI Nonmasked Interrupt Flags (HTX_PAI_IRQ_NOMASK)

This register shows the nonmasked interrupt flags. Write 1 to clear.

13.12.3.1.6.1 Offset

Register	Offset
HTX_PAI_IRQ_NOMASK	10h

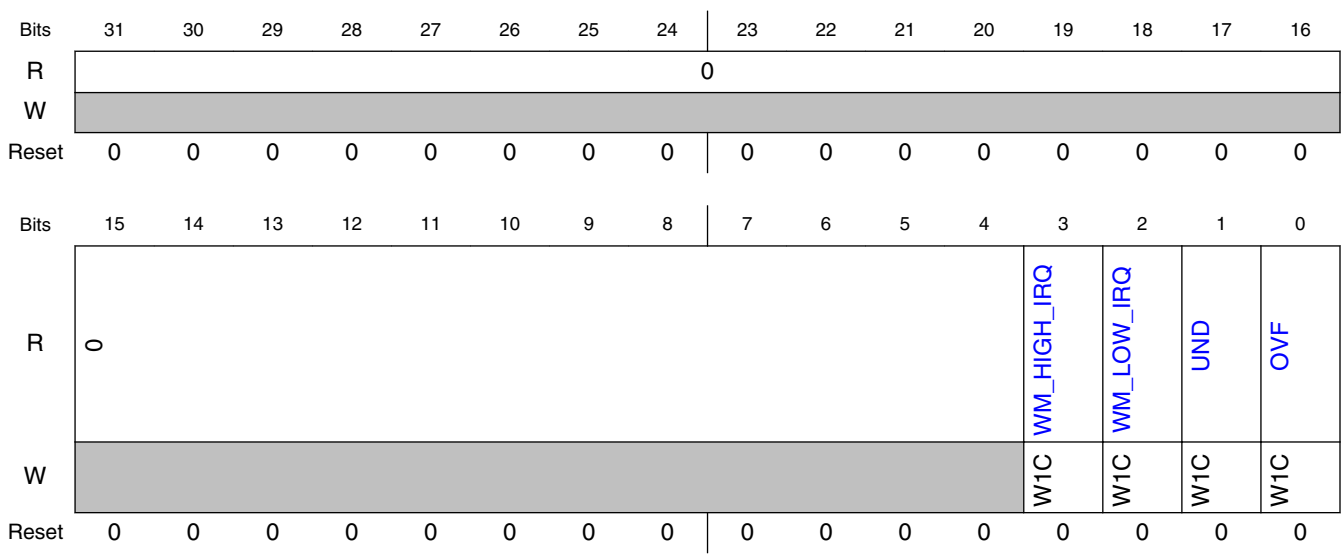
13.12.3.1.6.2 Diagram

13.12.3.1.6.3 Fields

Field	Description
31-4 —	Reserved
3	Watermark High IRQ

Table continues on the next page...

Field	Description
WM_HIGH_IRQ	This IRQ will be flagged when the number of entries in the link buffer transitions above the threshold programmed in HTX_PAI_CTRL[WTMK_HIGH].
2 WM_LOW_IRQ	Watermark Low IRQ This IRQ will be flagged when the number of entries in the link buffer transitions from above the threshold programmed in HTX_PAI_CTRL[WTMK_LOW] to below the threshold.
1 UND	HTX PAI Buffer Underflow This IRQ will be flagged when a buffer underflow occurs in the HTX PAI. A buffer underflow indicates that the HDMI TX controller is requesting data faster than the HTX PAI is receiving it.
0 OVF	HTX PAI Buffer Overflow This IRQ will be flagged when a buffer oveflow occurs in the HTX PAI. A buffer overflow indicates that the HDMI TX controller is requesting data slower than the HTX PAI is receiving it.



13.12.3.1.7 HTX PAI Masked Interrupt Flags (HTX_PAI_IRQ_MASKED)

This register shows the maskable interrupt flags. Write 1 to clear.

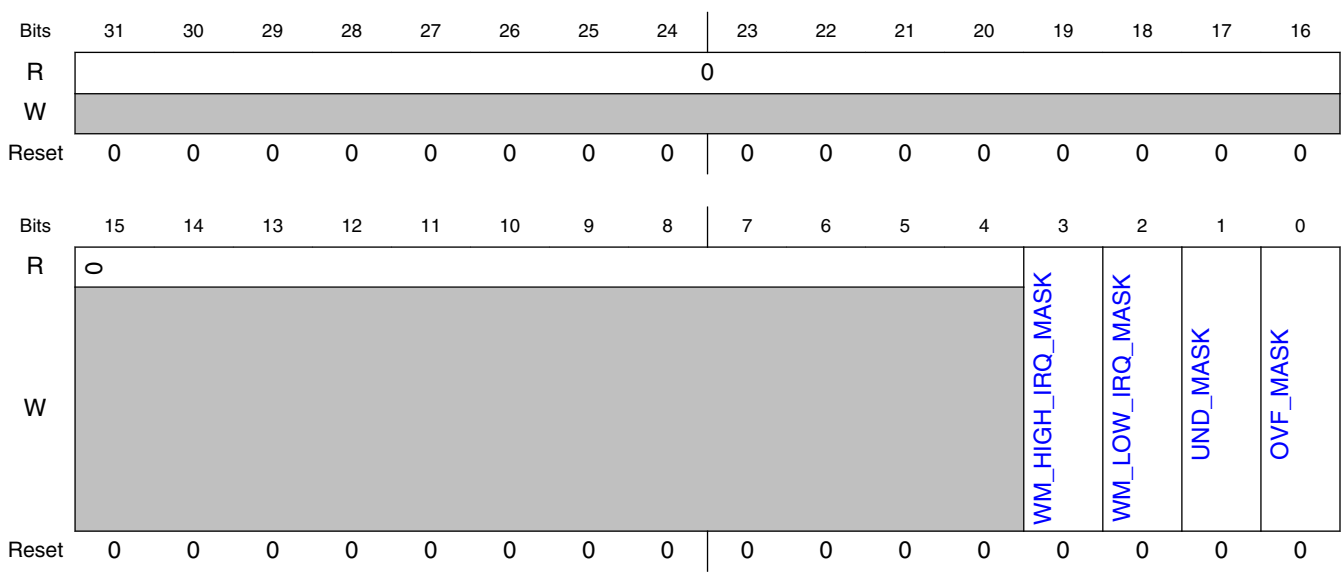
13.12.3.1.7.1 Offset

Register	Offset
HTX_PAI_IRQ_MASKED	14h

13.12.3.1.7.2 Diagram

13.12.3.1.7.3 Fields

Field	Description
31-4 —	Reserved
3 WM_HIGH_IRQ	Watermark High IRQ Masked Masked version of WM_HIGH_IRQ.
2 WM_LOW_IRQ	Watermark Low IRQ Masked Masked version of WM_LOW_IRQ.
1 UND	HTX PAI Buffer Underflow Masked version of UND IRQ.
0 OVF	HTX PAI Buffer Overflow Masked version of OVF IRQ.



13.12.3.1.8 HTX PAI IRQ Masks (HTX_PAI_IRQ_MASK)

This register controls the IRQ Masks.

13.12.3.1.8.1 Offset

Register	Offset
HTX_PAI_IRQ_MASK	18h

13.12.3.1.8.2 Diagram

13.12.3.1.8.3 Fields

Field	Description
31-4 —	Reserved
3 WM_HIGH_IRQ_MASK	Watermark High IRQ Mask Set this bit to 1 to mask the WM_HIGH_IRQ.
2 WM_LOW_IRQ_MASK	Watermark Low IRQ Mask Set this bit to 1 to mask the WM_LOW_IRQ.
1 UND_MASK	HTX PAI Buffer Underflow Mask Set this bit to 1 to mask the UND IRQ.
0 OVF_MASK	HTX PAI Buffer Overflow Mask Set this bit to 1 to mask the OVF IRQ.

13.13 HDMI TX Parallel Video Interface (HTX_PVI)

13.13.1 Overview

The HDMI TX Parallel Video Interface (HTX_PVI) is a digital module that acts as the bridge between the Video Subsystem to the HDMI TX Controller.

13.13.1.1 Block Diagram

The HTX_PVI block diagram is represented by the following figure:

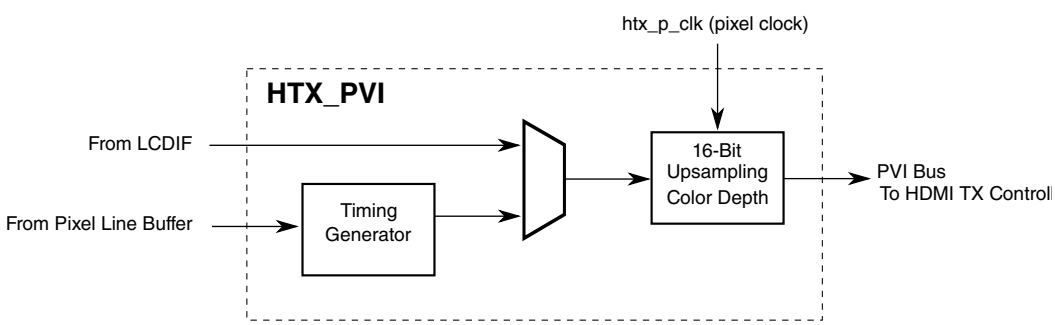


Figure 13-85. HTX_PVI Block Diagram

13.13.1.2 Features

The features for the HTX_PVI are as follows:

- Timing generator:
  - Implements full CEA-861-G compliant Hsync, Vsync, and DE timing strobes
  - Generates 4 independently programmable IRQs
- Supports input pixel formats RGB444, YCbCr444 and YCbCr422
- HTX_PVI interface supports 48-bits (16-bit color depth) of pixel data per htx_p_clk clock cycle
- The 16-bit color depth upsampling logic has software control to select between the following upsampling options:
  - csr_htc_upsample = 0x0 = lower 4 bits tied to 4'h0 (default)
  - csr_htc_upsample = 0x1 = lower 4 bits are replicated with the respective color component's bits[11:8]

13.13.2 Functional Description

13.13.2.1 Modes of Operation

The HTX_PVI operates in two different modes:

- LCDIF direct path to HDMI TX Controller
- Pixel Line Buffer path to HDMI TX Controller

13.13.2.2 Timing Generator

The timing generator provides fully compliant CEA-861-G timing strobes to the HDMI TX Controller. This feature is necessary to protect the HDMI TX incoming video stream from a HDMI RX frequency change such as video mode change or loss of clock due to sink cable disconnect. In order to protect the HDMI TX controller from HDMI RX change of frequency (or loss of clock), and pixel underflow conditions, the timing generator will implement the following functions:

- Fully functional timing generator and pixel background color insertion control - basic function of the Color Sub-sampler, when operating in pass-thru mode will be retain where the incoming pixel stream kicks off the timing generator and insert the incoming pixels with the regenerated timing strobes
- Timing generator implements full CEA-861-G compliant Hsync, Vsync, and DE timing strobes:

    - Counters start counting based off of the incoming Vsync assertion
    - Hsync counter with control register programming for Hsync rising and falling edge count values
    - Vsync counter with control register programming for Vsync rising and falling edge
    - For timing generated strobes, independent control registers used to select Hsync, Vsync and DE assertion active high or low
    - For incoming video stream timing strobes, independent control registers used to select Hsync, Vsync and DE assertion active high or low
- The timing generator pixel insertion:
    - In the pixel data path just before the timing generator, pixels are popped off an async fifo. The pixel source is a streaming source, where valid data is always available. The async fifo data valid signal is used to:
        - If async fifo data is not empty – Pixel data is transmitted with the timing generator's generated timing strobes
        - If async fifo is empty – This represents an underflow condition. The timing generator performs two functions:
            - Assert an underflow error IRQ
            - Insert a background pixel
    - The timing generator will generate 4 independently programmable IRQs. Each IRQ will be programmable to trigger on any Frame row and pixel location within that row
    - In the case where the Pixel Line Buffer is the path to HDMI TX Controller, the timing generator will generate the HRV_MWR kick. The kick will be software configurable to any Frame row and pixel position within that row
        - The kick should never be generated if the HDMI TX datapath is not selected as the input source to the HRTX Pixel Line Buffer

13.13.2.3 16-bit Color Depth Upsampling

The HTX_PVI interface supports 48-bits (16-bit color depth) of pixel data per htx_p_clk clock cycle. The 16-bit color depth upsampling logic will have software control to select between the following upsampling options: csr_htc_upsample – 0x0 = lower 4 bits tied to 4'h0 (default). 0x1 = lower 4 bits are replicated with the respective color component's bits[11:8]. Based on the software configuration, the pixel data will be upsampled, and pack the pixel data for the HTX_PVI interface as shown in the figures below.

Video Format				Pixel Data [47:32]																Pixel Data [31:16]														Pixel Data [15:0]													
Color Space	Color Depth	Sample M. Code		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

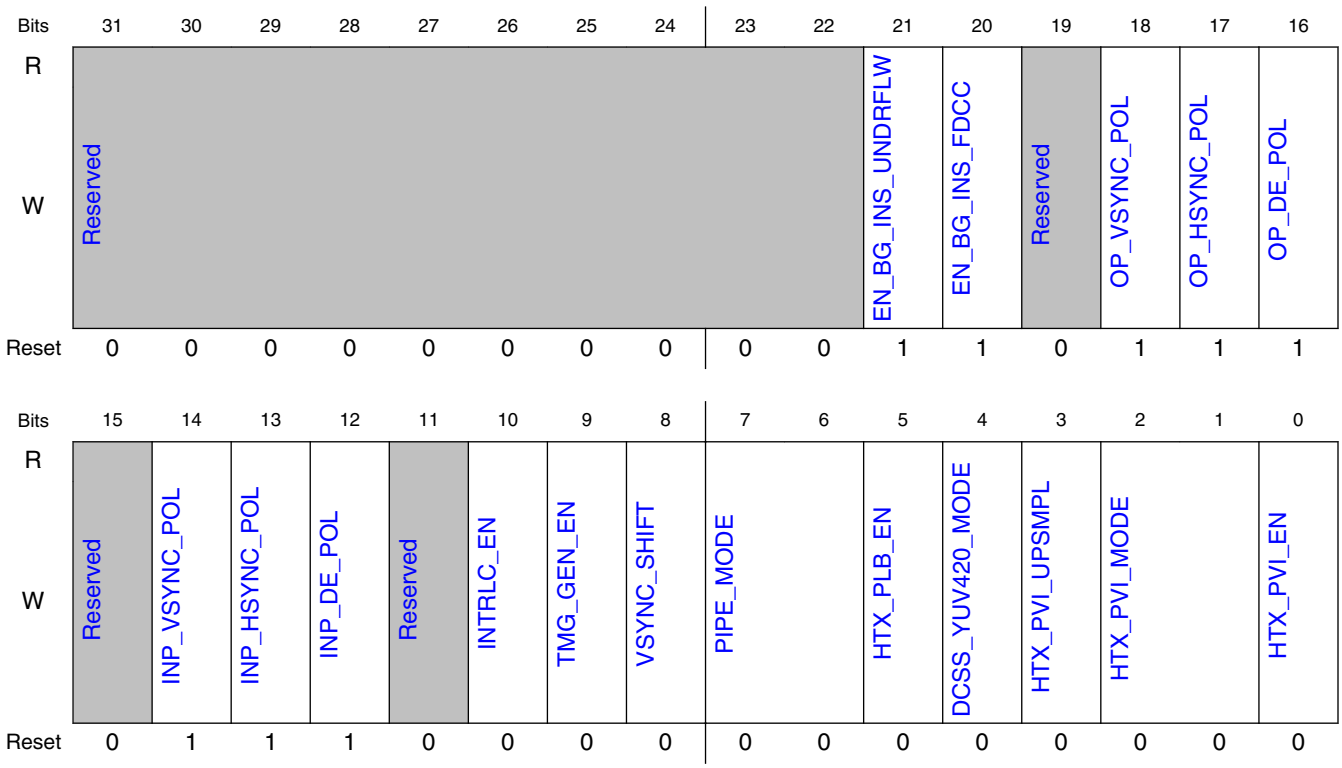
38	Background Color insertion for G or Cb (HTX_TMG_GEN_BG1)	32	RW	0000_0000
3C	Background Color insertion for B or Cr (HTX_TMG_GEN_BG2)	32	RW	0000_0000
40	HStart and Vstart Delay Configuration (HTX_TMG_GEN_CFG)	32	RW	0000_0000



13.13.3.1.2 HTX_PVI Control Reg (HTX_PVI_CTRL)

Contains the Configuration for the HTX PVI

13.13.3.1.2.1 Offset

Register	Offset
HTX_PVI_CTRL	0h

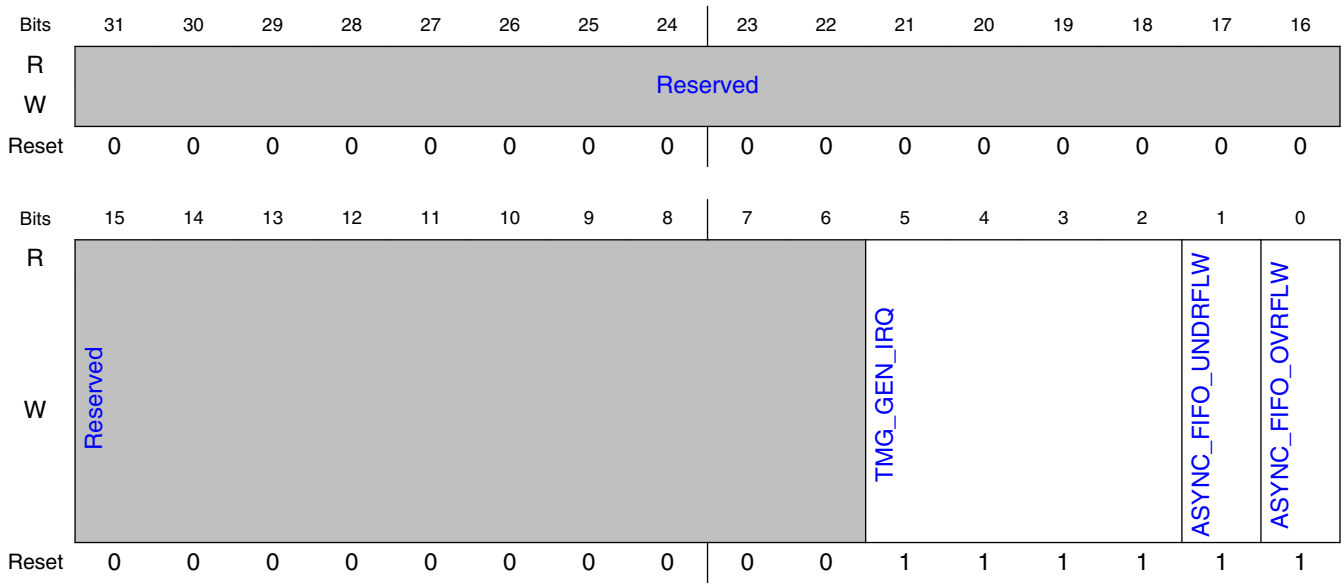
13.13.3.1.2.2 Diagram

13.13.3.1.2.3 Fields

Field	Description
31-22 —	Reserved
21 EN_BG_INS_UNDRFLW	Enables the insertion of background color if the async FIFO underflows.
20 EN_BG_INS_FDCC	Enables the insertion of background color if FDCC detects the HDMI Rx reference clock is out of specified video mode frequency range.
19 —	Reserved
18 OP_VSYNC_POL	Controls the polarity of Vsync of the outgoing data. 0 : Active Low, 1: Active High
17 OP_HSYNC_POL	Controls the polarity of Hsync of the outgoing data. 0 : Active Low, 1: Active High
16	Controls the polarity of DataEnable of the outgoing data. 0 : Active Low, 1: Active High

Table continues on the next page...

Field	Description
OP_DE_POL	
15 —	Reserved
14 INP_VSYNC_POL	Contains the information about the polarity of Vsync of the incoming data. 0 : Active Low, 1: Active High
13 INP_HSYNC_POL	Contains the information about the polarity of Hsync of the incoming data. 0 : Active Low, 1: Active High
12 INP_DE_POL	Contains the information about the polarity of DataEnable of the incoming data. 0 : Active Low, 1: Active High
11 —	Reserved
10 INTRLC_EN	Set this bit to 1 to enable interlaced HDMI timing.
9 TMG_GEN_EN	Set this bit to 1 to enable Timing Generator to insert the hsync and vsync.
8 VSYNC_SHIFT	Set 0 to run in general interlaced mode. Every other field the vsync is shifted forward 1/2 scan lines. In addition, the horizontal back porch is extended 1 scan line. Set 1 run in special interlaced format. This shifts vsync backwards 1/2 scan line every other field. Remaining timing won't change.
7-6 PIPE_MODE	Sets the Timing Generator mode. 00: bypass 01: 422 subsample 10: 420 subsample 11: bypass
5 HTX_PLB_EN	Enables Data write to PLB from HDMI Tx
4 DCSS_YUV420_MODE	Indicates the data coming in from DCSS is in yuv 420 mode
3 HTX_PVI_UPSMPL	Select the mode of upsample in case of 16bit output and 12bit input 0 -- Fill LSB with 4'b0, 1 -- Fill LSB with MSB 4 bits, i.e. [11:8]
2-1 HTX_PVI_MODE	Selects the mode of operation in HTX PVI 0 -- Select the DCSS Path, 1 -- Select the Bypass path from HDMI Rx 2 -- Select the LCDIF Path 3 -- Reserved
0 HTX_PVI_EN	Enable to block to receive incoming data



13.13.3.1.3 Masks off the Interrupts (HTX_PVI_IRQ_MASK)

Contains the Error and other interrupts from HTX PVI

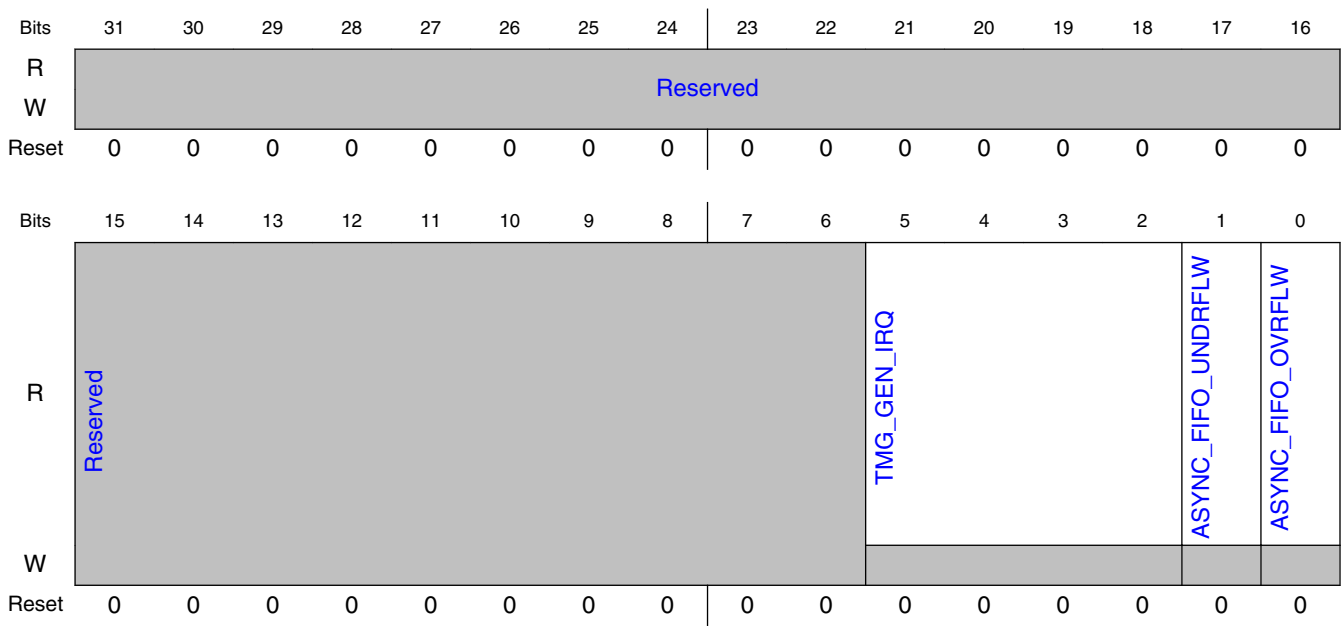
13.13.3.1.3.1 Offset

Register	Offset
HTX_PVI_IRQ_MASK	4h

13.13.3.1.3.2 Diagram

13.13.3.1.3.3 Fields

Field	Description
31-6 —	Reserved
5-2 TMG_GEN_IRQ	4 IRQs that can be generated from Timing Generator
1 ASYNC_FIFO_UNDRFLW	Indicates the Async FIFO has underflow
0 ASYNC_FIFO_OVRFLW	Indicates the Async FIFO has overflow



13.13.3.1.4 Interrupt Status (HTX_PVI_IRQ_STATUS)

Contains the Error and other interrupts from HTX PVI

29 —	Reserved
28-16 V_STRT_DLY	Starting position of VCount to enable Starting in VBack, VSync or VFront
15-13 —	Reserved
12-0 H_STRT_DLY	Starting position of HCount to enable Starting in HBack, HSync or HFront

13.14 Image Signal Processor (ISP)

13.14.1 Overview

The Image Signal Processing (ISP) core is a complete video and still picture input block. It contains image processing and color space conversion (RAW Bayer to YUV) functions. The integrated image processing unit supports simple CMOS sensors delivering RGB Bayer pattern without any integrated image processing and also image sensors with integrated YCbCr processing.

13.14.1.1 Block Diagram

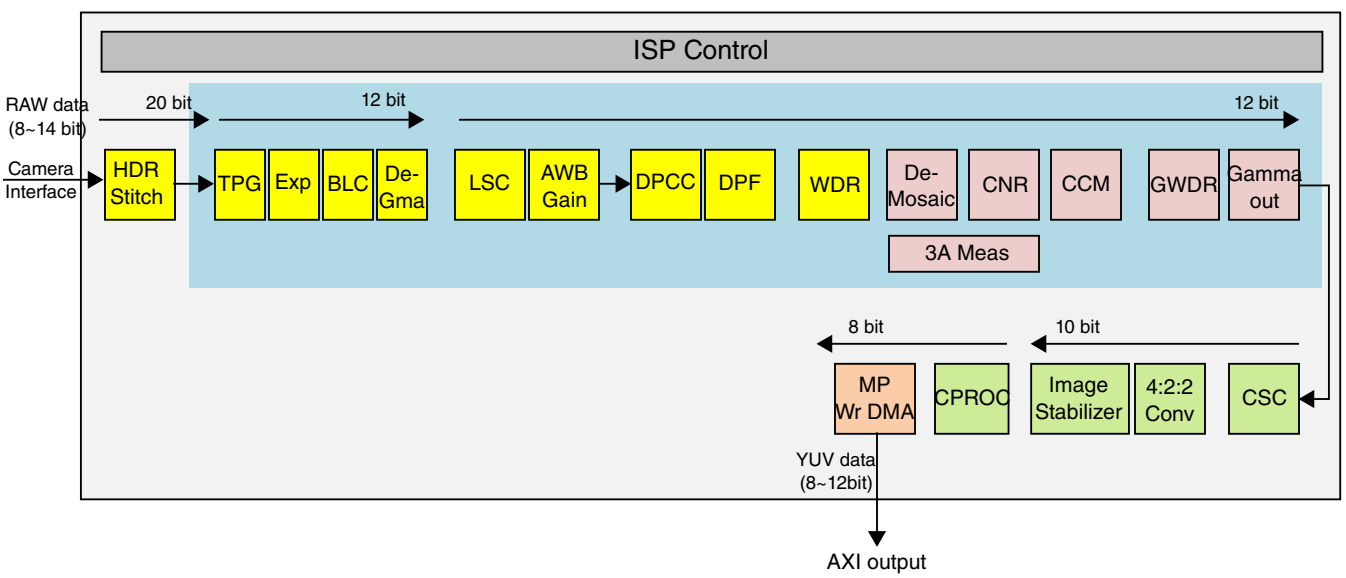

Figure 13-88. ISP High-level Block Diagram

13.14.1.2 Features

The ISP is connected to a MIPI-CSI interface and receives 1 pixel/clock from the CSI Rx Controller. Key features of the ISP include:

- Input Formats:
  - YCbCr420
  - YCbCr422
  - RAW8
  - RAW10

    - RAW12
    - RAW14
- Wide Dynamic Range (local tone mapping)
- High Dynamic Range (HDR)
    - Native HDR sensor with compand output and max 14-bit compressed input
    - 2-exposure and 3-exposure line-interleaved (staggered) HDR
        - Full resolution for multiple exposures is output by the image sensor, and the sensor outputs are interleaved on a per-line basis. No impact to vertical resolution, but frame rate is reduced by a factor of 2 (for 2-exposure HDR) or 3 (for 3-exposure HDR).
        - Referred to as DOL-HDR (Digital Overlap High Dynamic Range) and as Staggered HDR (12-bit x3)
- A separate Dewarp engine is also supported to adjust an image (i.e. fisheye lens) at a resolution up to the max resolution supported by the ISP.

NOTE

High Dynamic Range (HDR) is NOT supported with 2-exposure Line-interlaced HDR, referred to as iHDR and BME-HDR (Binning Multiple Exposure).

13.14.1.2.1 ISP Module

The following features are supported by the main ISP submodule:

- ISP input interface is ITU-R BT.601 compatible
- Variable sensor interface for RGB-Bayer Sensors
- Input sampling on positive or negative sample clocks
- Cropping of the output picture (to crop interpolation artifacts), also used for windowing
- Black level compensation
- Bad pixel detection/correction
- Lens shade correction
- Denoising pre-filter
- Bayer de-mosaic filter
- Chromatic Aberration Correction
- Filter (Noise reduction, Sharpness, Blurring)
- Programmable gamma correction for sensor adaptation and display correction
- Sensor crosstalk compensation
- Enhanced Chroma Noise Reduction (CNR)
- Automatic white balance measurements (AWB)
- Exposure measurement for AE (AEC/AGC)
- Auto focus measurement (AF)
- Histogram calculation

- Mechanical shutter control
- Flash light control
- Video Stabilization

13.14.1.2.2 CPROC Module

The following features are provided by the color processing (CPROC) submodule:

- 2*10 bit data input interface
- 2*8 bit data output interface
- 10 bit resolution per color component
- Operates on 4:2:2 YCbCr format
- Full range and ITU-R BT.601 range are independently programmable for input and output.
- Contrast adjustment
- Brightness adjustment
- Saturation adjustment
- Hue adjustment

NOTE

Full range and ITU-R BT.601 range are independently programmable for input and output. Contrast adjustment has to be done with contrast register and brightness register settings.

13.14.2 Functional Description

13.14.2.1 Block Descriptions

The main functional blocks of the ISP are described in the table below.

Table 13-39. ISP Functional Blocks

ISP Block	Description
Input Port	The ISP connects to an external CMOS sensor. Supported sensors are MIPI CSI. It can support 8-14-bit data width. Different Bayer Pattern (R, Gr, Gb or B) can also be programmed.
HDR Stitch	If using DOL/staggered HDR sensor, the ISP can drive the sensor in different exposures and stitch it together. This allows for a linear sensor to be extended in dynamic range, less noise. This block supports 2-dol or 3-dol HDR and does not require external DRAM.
Test Patten Generator (TPG)	Used for ISP diagnostics. Can be programmed to generate a variety of color and random test patterns.
Expand LUT (Exp)	When a build-in HDR sensor with a compressed output is used (e.g. OV2775), this 64 bin programmable look-up table reverses the image sensor's compression function, producing a normalized data path for the following processing of the ISP.

Table continues on the next page...

Table 13-39. ISP Functional Blocks (continued)

ISP Block	Description
Black Level Compensation (BLC)	Adjusts for given black level from sensor. Normalizes black value for following processing of ISP pipeline.
De-gamma	This programmable look-up table is for making the sensor linearization.
LSC	Mesh shading correction: Programmable unequal interval per-color mesh look-up table with bi-linear interpolation. It is co-working with the AWB firmware algorithm.
Automatic white balance measurements (AWB)	AWB statistics values are provided per zone (32x32 zones, 4 Bayer Planar). Used by the AWB firmware algorithm to calculate per channel gains and color matrix values.
AE	AE statistics are provided on a per-zone basis (32x32 zones), which is employed for the AE algorithm (in firmware) to calculate exposure and gain.
Defect Pixel Cluster Correction (DPCC)	Both table-based static and dynamic defect pixel correction is included. Static defect pixel correction is managed by a locally stored location LUT while dynamic correction detects and removes defective pixels on-the-fly.
Denoising Pre-Filter (DPF)	2D 9x9 Bayer bilateral noise filter to remove sensor noise, and keep edge and details.
Wide Dynamic Range(WDR3)	VSI dynamic range compression / local tone mapping engine. This block is used to achieve natural visibility based on the local contrast improvement model for single-frame, stitched frame and sensor-build-in HDR frame. Support pixel-by-pixel enhancement auto-control.
Demosaic	Converts the RAW Bayer pipeline data into 12-bit RGB. The demosaic algorithm employed is an advanced 8 directional context-based interpolation, incorporating de-moiré, de-false color, de-purple and edge-aware blur/sharpness controls. Extreme care is taken to preserve details.
Chroma Noise Reduction (CNR)	Removes small color noise especially on mobile camera.
Color Correction Matrix (CCM)	Programmable 3x3 color matrix and 3x1 offset used by the AWB firmware algorithm to adjust color on-the-fly based on given light sources.
GWDR	Programmable LUT based global tone curve to improve global luminance.
Gamma out	Programmable 64-node piecewise linear look-up-table to provide gamma correction for data regulation, separated LUT planar for R,G,B plane.
Color Space Conversion (CSC)	3x3 programmable color matrix capable of converting RGB to YUV444 standard color spaces.
Conv422	Conversion from YUV444 to YUV422
IS (CROP)	The output can be cropped to a desired programmable size (Height x Width).
Color Processing (CPROC)	Implements global contrast, brightness, hue, saturation regulation.
Dynamic Memory Access (DMA) Writer	Each output of the ISP includes a DMA writer block which drives 128 Bytes AXI master(s) to write the output image data to memory on-the-fly. Supports RGB and YCbCr/YUV modes. In YUV modes, planar and semi-planar modes are supported with programmable Horizontal & Vertical down-sampling (e.g. YUV 4:2:2 and 4:2:0 are supported). Main path output also supports output Bayer data.

13.14.2.2 Input Format Support

13.14.2.2.1 Sensor Inputs

The sensor interface is implemented as an ITU-R BT.656 compliant video data interface with included timing reference codes or optionally as an ITU-R BT.601 interface with separate horizontal and vertical synchronization inputs. Supported video formats are:

- RGB BAYER data in all possible pattern layouts
- YCbCr 4:2:2 with the following luminance/chrominance orderings:
  - YCbYCr
  - YCrYCb
  - CrYCbY
  - CbYCrY

Horizontal and vertical synchronization signals can be interpreted as synchronization pulses or reference signals independently.

13.14.2.2.2 MIPI Inputs

The ISP can support the following image data formats through the MIPI interface (see the MIPI-CSI2 standard for details about the image data formats and byte sequences):

- YUV 4:2:2 8bit / 10bit (to YUV processing chain)
- non-legacy YUV 4:2:0 8bit / 10bit with cosited chroma sampling (direct to system memory)
- non-legacy YUV 4:2:0 8bit / 10bit with non-cosited chroma sampling (direct to system memory)
- legacy YUV 4:2:0 8bit (direct to system memory)
- RAW 6-bit / 7-bit image data (direct to system memory)
- RAW 8-bit / 10-bit / 12-bit / 14-bit image data (to RGB Bayer data processing chain)

13.14.2.3 Output Data Format Support

13.14.2.3.1 Main Path Format Support

The following output data formats are supported:

- YCbCr 4:2:2 or 4:2:0 either planar or semi-planar or interleaved.
- 8 to 12 bit RAW data with data end signaling.

13.14.2.4 Clock Domains

There are four independent clock domains in the ISP, and they are detailed in the table below.

Table 13-40. ISP Clocks

Clock	Signal name	Description
Core Clock	clk	Core clock is the main clock domain used by the ISP modules and is the biggest clock domain in the ISP.
Sensor Clock	sclk	The sensor clock domain is selected from the sensor interface and is the data input clock.
AHB Clock	hclk	The AHB Clock is the AHB Interface clock.
AXI Clock	m_hclk	The AXI Clock is the AXI Interface clock.

The communication between the different domains in ISP occurs mostly by way of asynchronous FIFOs. All clocks are asynchronous to each other. There is no communication between AHB and AXI clock domains.

13.14.2.5 Clock Gating

Automatic localized clock gating is employed in the ISP to minimize dynamic power consumption. An additional clock gating mechanism is employed in the ISP submodule. Each ISP submodule contains it's own local configuration registers. For optimized power consumption, these registers are clocked during read/write data transfers only. Clock gating is settable, but is handled automatically by default within the control unit.

13.14.2.6 Reset

The ISP supports an asynchronous reset. The reset is programmable via the Control Unit. An asynchronous reset for the sensor clock domain is generated from the system reset. A soft reset for all ISP registers is also supported, and behaves like the asynchronous hardware reset.

13.14.2.7 External Signals

Table 13-41. External Signals

Signal	Description
ISP_FL_TRIG_n	Flashlight trigger signal extern input

Table continues on the next page...

Table 13-41. External Signals (continued)

Signal	Description
ISP_FLASH_TRIG_n	Flashlight control trigger output
ISP_PRELIGHT_TRIG_n	Pre-light control trigger output
ISP_SHUTTER_OPEN_n	Shutter open
ISP_SHUTTER_TRIG_n	Shutter trigger input

13.14.2.8 Shadow Registers
